The Jefferson Orchards Voluntary Remediation Plan application reports that the ground water is only 60 feet from the surface at the site. It is described in the scientific literature that this land is an upland plane with large amounts of water in the epikarst, and contamination of this

water effects the whole aquifer including the communications with surface water streams. A USGS study demonstrated that the groundwater adjacent to the site communicates readily with several surface water structures and wells miles away from the site. The effects of contamination at this site would go well beyond Ranson fouling large portions of the ground water and surface water in Jefferson County.

Groundwater contamination at the site would have devastating effects on the Agricultural industry in Jefferson county. For geographic and economic reasons it is simply infeasible for the agricultural industry to rely on utility provided water. Based on the scientific literature the site being considered for rezoning is one of the areas of highest aquifer vulnerability in Jefferson County and is inappropriate for the industry that this zoning change will provide for.

By threatening the local agricultural industry, the industry that this zoning will provide for will threaten the health, safety, and welfare of the community. The Comprehensive Plan in Ranson is clear the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Mary & michael Whalen

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would negatively affect tourism, economic agility, groundwater quality, and individual health in neighboring municipalities like Shepherdstown.

Tourism is critically important to Shepherdstown's economy and to the county as a whole. In 2018, tourist spending in the Jefferson County contributed over \$170 million to state and local government revenue and \$213 million in individual earnings. Importantly, most of this money comes from tourists visiting from neighboring states like Virginia, Maryland, and Washington D.C. Out-of-state tourists are largely drawn to Jefferson County because of its reputation for environmental-friendly, sustainable industry. Key elements that support this reputation include the county's pastoral scenery and pristine natural resources. Ordinance #2017-302 will allow industry into Jefferson County that risks harming these elements and dramatically reducing the area's appeal to visitors. The resulting harm to our tourist industry would drive away visitors and decrease state, county, and local revenue. The long-term success of Jefferson County's tourism industry is dependent on local governments making coordinated zoning decisions. Allowing certain types in industry in Ranson will negatively affect tourism in every municipality throughout the county, including Shepherdstown. Voting no on ordinance #2017-302 will protect the foundations of the county's tourism industry and protect the 7,040 jobs in Jefferson County that are directly supported by tourism.

The type of large, consolidated industry that ordinance #2017-302 would allow in Ranson would generally reduce the flexibility of local economies in Jefferson County. Historically, the driving industries in Jefferson County have been tourism, agriculture, and the equine industries. These three industries are large conglomerates of small businesses. Small business is very important to Sheherdstown. Small businesses have been shown to create more jobs, cultivate more innovation, and provide more opportunities than big, non-local firms. Additionally, small businesses have been shown to more reactive to sudden changes relative to manufacturing

businesses. Bringing large, manufacturing-based industry into Jefferson county will depress the local economy and stifle innovation. During this time of economic upheaval and uncertainty, Jefferson County needs to support industries that will allow local economies to adapt and recover as fast as possible.

Voting no on ordinance #2017-302 will help protect water resources throughout Jefferson County. The type of industry that ordinance #2017-302 would allow puts the ground resources of Jefferson county at significant risk due to the karst hydrogeology. The site in Ranson is in the Rocky Marsh Run watershed, which is in the source water protection zone for Shepherdstown and drains to the Potomac River. Therefore, activity at this site will affect both groundwater and surface water streams. In municipalities like Shepherdstown, many residents and nearby farms depend on wells for water. Contamination of groundwater aquifers would create both health and remediation concerns for local residents. Dye tests performed by the USGS near the area of proposed rezoning in Ranson have shown just how far-reaching groundwater contamination at the Ranson site could be. Results from the USGS study revealed measurable dye concentrations in Elk's Run, Rattlesnake Run, and even the Shepherdstown Town Run. This last run cuts through the center of Shepherdstown and is a favorite area for children to play and learn to fish.

Groundwater pollution is not the only concern for communities like Shepherdstown. The type of industry that ordinance #2017-302 would allow in Ranson would also generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. These pollutants are particularly harmful to children. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. The site in Ranson is across the road from an elementary school and also within the Jefferson High Middle district. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of children in Shepherdstown and all of Jefferson County.

I again request that you vote no on ordinance #2017-302. The long-term economic, environmental, and community health of municipalities like Shepherdstown depend on Ranson's participation in a coordinated zoning plan for all of Jefferson County.

Sincerely,

Robert Smith
Shepherdstown, 25443

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on #2017-302. The air emissions, possibility of ground and surface water contamination, and their effect on our interwoven economies threaten the health, safety and welfare of not just Jefferson County but the greater region, including Loudoun and the greater Northern Virginia area.

This zoning would provide for industry that produces large amounts of air emissions. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. Northern Virginia is directly downwind from these emissions. Much of the gaseous, fine particulate, and hazardous emissions can reach Northern Virginia. Further affecting the outdoor air quality of the adjacent portion of Virginia and the ability of these areas to achieve and maintain National Ambient Air Quality Standards (NAAQS) attainment. This will affect agriculture and outdoor leisure and recreation.

For example, Loudoun County has been in nonattainment for the NAAQS 8-hour Ozone standard for the past two years. VOC and NO_x react after they have been emitted to produce ground level ozone. The industry that this rezoning would provide for would produce large amounts of these emissions. This would make it even harder as Loudoun County tries to achieve attainment. As time goes on and the scientific research advances our knowledge and understanding of the extent to which gaseous, particulate and hazardous emissions affect human health the NAAQS standards are likely to be reduced. The effects on air emission from this rezoning will make it only harder for Loudoun and Northern Virginia to meet these standards.

In addition to the concerns about the air, the possible ground and surface water contamination is very concerning to Loudoun and Virginia residents. The site is known to have ground water that is vulnerable to contamination due to the karst hydrogeology. A USGS study demonstrated that the ground water adjacent to the site to be rezoned communicates readily with surface

water tributaries of the Potomac River. In addition to direct infiltration where water moves directly from the surface to groundwater via porous limestone bedrock, karst is known to have severe ground instability problems. This makes karst geology prone to sinkhole development. Sinkholes provide direct connection between the surface water and any contaminants it may contain and the groundwater. This makes the aquifer vulnerability in karst areas very high, and contamination with industrial activity such as that provided for by this rezoning too likely.

Loudoun sources its drinking water from the Potomac River, downstream of many West Virginia tributaries that carry water from the epikarst and groundwater aquifer at the site to be rezoned. Loudoun has recently completed the new Trap Rock Water Treatment facility, which draws water from the Potomac River. Loudoun currently provides 40 million gallons and projects to provide 90 million gallons of drinking water a day to customers by 2040 (Loudounwater.org). Therefore, the viability of the Potomac River is a high priority for Virginia residents.

Loudoun and Northern Virginia is one of the fastest growing communities in the country and provides a lot to Jefferson County in their symbiotic relationship. Virginia residents support and enjoy Jefferson County through tourism, as our residents enjoy the natural and historical resources of your county. Virginia residents and businesses support the equine industry in a multitude of ways from providing wagering fans at the races to the Virginia Breeders Association Virginia Certified incentive programs and a strong market for retired racehorses. According to an economic impact study from WVU, at least 40% of Jefferson County residents travel outside of West Virginia for work, a good percentage of those travel to northern Virginia. This rezoning would allow for industry that would negatively affect the economy of both places and this relationship and the benefits for our residents gleaned from it.

This zoning change will provide for industry that will negatively effect the health safety and welfare of the Loudon and Northern Virginia community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Marlene Frabasilio

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

This land and this location are not appropriate for the industry this zoning change will allow. The hydrogeology of the land combined with such industrial activity risks the safety of our water supply. The air emissions from this industry will negatively impact our physical and mental health, our children's ability to achieve, our ability to make a living, our happiness, and it will do this for generations even after we leave or the pollution stops. It is not lost on us that this zoning change is being made next to our neighborhood and not next to the residents of Ranson, yet Ranson is in control. This is not right. We respectfully ask you to vote NO on ordinance #2017-302.

The land at the site in question is not just ill-suited, but completely inappropriate for the industry this zoning change will allow. This land has karst hydrogeology. As such, the ground itself is very unstable and readily develops sinkholes. This land has been described by a 2012 study to be exceptionally susceptible to sinkhole formation, more so than most of the rest of the county. Sinkholes provide point infiltration of surface water into the water in the epikarst. The porous bedrock allows diffuse infiltration of surface water into the epikarst water. At this site, there is also large amounts of water in the epikarst and it is only 60 feet from the surface. This allows the water at the surface to easily communicate with the water in the epikarst and the groundwater aquifer carrying any surface water contaminants with it.

The industrial activity this zoning change will allow for will cause ample surface water contamination from ground level industrial activities, raw material and waste storage and particulate matter falling to the ground from the air emissions. The industry that is currently planning to utilize this zoning change should be designated a stormwater hotspot just for this reason. The WVDEP should require them to treat all water before it is allowed to infiltrate the ground, but so far, this has not been done. The WVDEP actually recommends that areas like this not be developed due to the risk to groundwater. Their guiding document, *Stormwater Management Design in Karst Areas* states, "it is important to note that the potential for

geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that the best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” This guidance should be followed; clearly we cannot expect the DEP to protect us from inappropriate zoning changes.

The wellhead protection area for the Fox Glen’s well and that of the elementary school where our children go to school intersects with the land where the zoning change is being proposed. However, a USGS study has shown that the groundwater aquifer here moves relatively fast and so contamination throughout this property is a concern for our water quality. This zoning change will clearly endanger the safety of our water supply. If the well at Fox Glen is contaminated and the utility is forced to divert water from further away, this may be used as evidence at the Public Service Commission to raise the water tariff on Fox Glen residents. This is an increase many will not be able to afford, raising the risk of water insecurity.

The air emissions that will be produced by the industry that this zoning will allow include gaseous (SO_2 , NO_2 , O_3 (VOC and NO_x)), particulate matter (PM_{10} , $\text{PM}_{2.5}$, $\text{PM}_{0.1}$), and hazardous emissions (neurotoxins and carcinogens). We will be exposed through our lungs from the air we breathe, through our skin from the air and things we contact, and through contaminated things we may ingest. Our kids will be more exposed because they spend more time playing outside and on the ground and kids like to put things in their mouth. In fact, according to the National Academy of Science, our kids are more at risk because they breathe more air per pound than adults, their detoxification pathways are less mature, they are growing and developing and these processes are more sensitive, and they have more years to live yet and thus more years to develop slow onset diseases. Exposure to air pollution in early human development, especially exposure to fine particulate pollution, can be extremely deleterious to children's health and development.

The negative effects start in utero. Embryonic and fetal cells are exquisitely sensitive and are affected directly by inhaled pollutants that cross the placenta like fine particulate matter as well as other secondary pathways causing impaired organ development, disturbed development of the immune system, premature birth, lower birth weight, and increased infant mortality. These early changes lead to long-term effects including increased disease development in multiple organ systems throughout life, cognitive defects, achievement deficits, and negative psychological social and economic effects.

Fetal and early life exposure to air pollution causes inappropriate brain growth and maturation in early life, neurodevelopmental disorders, early cognitive deficits, and has been associated with autism by several case-control studies. Several studies have demonstrated a scholastic deficit in exposed children for almost all subject matter and at a variety of grade levels. The cause of these findings are multifactorial and researchers suggested they include exacerbation of asthma symptoms, other decreased health parameters, increased fatigue, increased absence, or a direct neurodegenerative effect, all caused by or contributed to by the exposure to air pollution.

Development of the respiratory system starts in utero, is 80% complete by age 6, and continues to early 20s. A review by Korten et. al. in 2017 explained that exposure to air pollution during the first 6 years of life can damage the lung tissue, impair lung growth, and alter the development of immune function and repair mechanisms within the lungs. These effects increase both short- and long-term risk for asthma, chronic obstructive pulmonary disease (COPD), lung cancer, and respiratory infections. Exposure to outdoor air pollution not only increased the risk of these diseases, but exacerbates existing disease increasing severity of symptoms, hospital visits, and death due to these diseases. A 2019 study found “even within the limits set by the World Health Organization, the pollutants PM10, SO2, NO2, and O3 are associated with increased risk of treatment for respiratory diseases in children 0 to 6 years of age.” It is important to note that the US limits are set higher than the WHO, 300% higher in the case of PM10!

There are a multitude of other physiologic effects of air pollution that cause increased rates of morbidity and mortality in both adults and children. Air pollutants are associated with increased risk of autoimmune diseases like asthma, allergies, and eczema. Air pollution has deleterious effects on the cardiovascular system, endocrine system and blood, contributing to the occurrence of high blood pressure, high cholesterol, obesity, anemia, and stroke.

There are psychological effects as well. A review, of 178 published articles by Lu published in 2020, systematically examined the psychological (affective, cognitive, behavioral), economic, and social effects of air pollution and found: “Affectively, air pollution decreases happiness and life satisfaction, and increases annoyance, anxiety, mental disorders, self-harm, and suicide. Cognitively, it impairs cognitive functioning and decision making. Behaviorally, air pollution triggers avoidance behavior, defensive expenditure, and migration as coping strategies. Economically, it hurts work productivity and stock markets. Socially, it exacerbates criminal activities and worsens perception of the government. Importantly, both actual and perceived air pollution levels matter.”

Through negative physical and mental health effects air pollution has been shown to decrease an individual’s productivity and ability to participate in the workforce, negatively impacting workforce availability and overall productivity. This negatively impacts individual workers, companies, and the local economy. It also decreases individual’s ability to relocate themselves or their family into an area less affected by pollution. In this way a vicious cycle is set up where successive generations are exposed to the same pollutants and experience the negative effects of the ongoing exposure to pollution. This is not a fate the children of Fox Glen deserve to have thrust upon them by this zoning change and the industry that it will allow into our bucolic county. An editorial in the New England Journal of Medicine, commenting on several recent studies, stated: “The best control strategy from the standpoint of human health, supported by the scientific evidence to date, is to reduce the levels of all types of air pollutants. Our children’s health depends on it.”

The area surrounding the location, of the proposed zoning change that will accommodate heavier types of industry, is historically lower income and underserved. Deciding to locate a tract of such zoning in this location when it is on the whole unwanted and totally inappropriate for the land and surroundings is an example of environmental injustice. The Lancet Commission on Pollution and Health, citing the United Nation's Universal Declaration of 1948 on Human Rights, found that "pollution threatens fundamental human rights - the right to life, the right to health, the right to well-being, and the rights of the child." This rezoning represents not only a bygone era of economic development but a bygone era of environmental injustice and human rights violation.

The Lancet Commission on Pollution and Health further found that prevention of non-communicable diseases will require pollution prevention and that this will require fundamental changes in societal patterns of production, consumption, and transportation. This will require a paradigm shift to a more sustainable economic model based on recognition of human rights. They also found this is a major unexploited opportunity in society that many communities are grappling with undertaking. The movement away from the smart code zoning, with it integrated walkable communities, to large tracts of land dedicated to polluting industry close to a title one school is the exact opposite of this. This rezoning would represent a major step in the wrong direction for disease prevention, human rights, Ranson, and Jefferson County!

This change in zoning is not appropriate for this land and this area. This land itself is not well suited for the industry this zoning change would allow. This industry would severely adversely affect the health, safety and welfare of our community. Please vote NO on the Ordinance #2017-302.

Sincerely,

jasmine Shoun

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on Ordinance #2017-302. Ranson's proposed zoning change presents a significant risk to the equine industry in Jefferson County and well beyond. The type of industry that would be allowed by the proposed zoning change in this location would jeopardize horse health, the groundwater supply, and workforce productivity. This will cause immediate shrinkage and threaten the long-term viability of the equine industry in the county.

The site of the proposed rezoning is less than six miles from Charles Town Races, with several breeding, training, and rehabilitation facilities between the two. The industry allowed by this rezoning would produce particulate, gaseous, and hazardous air emissions that would reach these sites. According to the WVDEP air permit, the Rockwool plant in Ranson is permitted to emit 250.87 tons of particulate matter per year into the air (1).

According to a recent study published in the journal of Veterinary Internal Medicine (2), horses are 15 times more sensitive to inhaled particulate matter than humans. Inhaled particulate matter can cause inflammation in horses' lungs that negatively affects performance. Inhaled particulate matter also contributes to the development of inflammatory airway disease (IAD) (3). IAD is a chronic airway disease that can affect horses long after their racing career is over. While there is little research on how other air pollutants affect horses, the effects of pollution on humans can be used to infer potential impact on horses. However unlike human models, these horses are elite athletes continuously exposed, and will thus likely experience detrimental effects at much lower levels of air pollution than humans.

The primary concern with air pollution is that increased levels of pollutants will increase inflammation in horses' lungs. Even small, subclinical amounts of inflammation in the lungs of horses negatively affect performance (2,3,4,5,6,11). This inflammation can also cause increased recovery times following racing (7,11). Reduced performance and training interruptions can lead to higher risk of injury, reduced winning average, fewer yearly starts, lower yearly

earnings, shortened career length, fewer lifetime starts, reduced lifetime earnings, and reduced quality of life (2,3,8,9,11). Each of these situations will lead to decreased return on investment, decreased cash flow, and decreased overall earnings for owners, trainers, and breeders with horses at Charles Town Races and in nearby areas.

While racing is usually a thoroughbred's first career, it is rarely their last. Some racing horses go on to be breeding stock, while others will have successful careers as sport horses. Jefferson County is an important source of new stock for sport horse trainers from Northern Virginia, and Maryland, and this is a resource for local horseman of both income and placement for horses not appropriate for breeding. However, if retired racehorses are unsound from injury or respiratory disease, they can be difficult to manage as breeding stock or unfit for a career as a sport horse. This affects the horse's quality of life and also places a burden on the industry locally and regionally.

The perception of decreased air quality from the increase in regional haze and visible smokestacks as one drives into the county will deter out of state owners and breeders from investing in West Virginia bred Race horses, decreasing or eliminating a critical \$50 million a year source of local business volume.

Another concern related to the proposed rezoning in Ranson is the risk of groundwater contamination as a result of the karst hydrogeology at the site and the industrial activity. Horsemen will either have to take on the expense of periodically testing water sources or they may not know local ground water is contaminated until their animals are sick. Veterinary care and testing adds expense and uncertainty to an industry that already deals with large inherent risks. The actual occurrence of ground water contamination would be devastating for Jefferson County's equine industry. For both geographic and financial reasons, it is simply impossible to think that the industry could solely use public or private utility-provided water if industrial activity fouled the local groundwater.

Finally, studies on US agricultural workers have demonstrated that increased air pollution decreases productivity of outdoors workers. This would place an additional burden on workers, small business owners and the industry.

The equine industry in Jefferson County is hundreds of years old. It is not worth risking this historic and economically valuable industry by rezoning for industrial companies like Rockwool. An economic impact study of the Charles Town Thoroughbred Horse Racing Industry on Jefferson County's economy found that the spending by owners, breeders, and trainers of the equine industry directly contributes \$79.4 million to the county each year. Out-of-state owners, breeders, and trainers spend more than \$50 million in Jefferson County every year. The value of total business volume in Jefferson County is \$191 million each year (10). These numbers do not include the effect of the handle or the casino.

The equine industry provides jobs for a broad cross-section of the public. This industry offers individuals of any educational background a variety of paths to achieve a good middle-income

living. Many jobs allow individuals to pursue apprenticeships or on-the-job training rather than requiring a costly college education. This flexibility allows for greater lifetime earnings and improved educational debt-to-earnings ratio for these workers. The equine industry also provides opportunities for non-traditional workers by offering job opportunities to those who may not be employable by larger corporations. This industry provides a variety of full-time, part-time, flexible, and pick-up work. Encouraging this type of flexible job ecosystem helps create a healthy economy with broad participation in employment and consumption.

The equine industry is a large conglomerate of small businesses, which have a multitude of economic benefits over having a few large businesses. It has been extensively reported that small locally owned businesses and start ups create more jobs, cultivate innovation, generate higher incomes, and provide more opportunities for individuals that would otherwise not exist than big non-local firms, which can actually depress local economies. The equine industry provides opportunities for small businesses and startups responsible for this growth of better jobs that are so good for the economy.

The equine industry offers so many other benefits that the industry in the rezoned area would not. For example, the equine industry supports local agriculture by providing a market for agricultural goods such as straw. The robust straw market supported by owners, trainers, and breeders allows for a third cash crop to be produced from one field in a year. Through pastureland and support of local agricultural goods, the equine industry protects and preserves the open spaces that give our county its bucolic quality and help attract tourists. Through the breeders' incentive programs, the equine industry offers unique opportunities to draft state funds back to Jefferson County, to name a few.

Rezoning this area of Ranson for Special District Industrial will allow in entities whose activities are harmful to the equine industry. The losses incurred by the equine industry would far outweigh any benefits derived from industries occupying the rezoned area. Sacrificing the long-term viability of one of our oldest and most productive industries for a net loss in business volume and economic value just does not make good sense for the local economy. Please vote NO on Ordinance #2017-302.

Sincerely,

Carolyn Jackson

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Rockwool and other heavy industry in Jefferson County will be, in my family's perspective, a degradation to the quality of life in Jefferson County. I am very sympathetic to the need for jobs and a sustainable economy, but not this way. There is so much more that our county can offer. With a child reaching school age we will be seriously contemplating a move to a location where the health of the community and land take priority over development simply for development's sake.

There are valid arguments claiming that Jefferson County and the surrounding communities had time to voice their positions before the deal was sealed. Understood, technically, perhaps. But that technicality does not change the reality of what the community wants, needs, and deserves now. And it is the now, the current moment, that will be driving the future of our region.

Thank you for your service.

Sincerely,

Shawn Walker

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on Ordinance #2017-302. Ranson's proposed zoning change presents a significant risk to the equine industry in Jefferson County and well beyond. The type of industry that would be allowed by the proposed zoning change in this location would jeopardize horse health, the groundwater supply, and workforce productivity. This will cause immediate shrinkage and threaten the long-term viability of the equine industry in the county.

The site of the proposed rezoning is less than six miles from Charles Town Races, with several breeding, training, and rehabilitation facilities between the two. The industry allowed by this rezoning would produce particulate, gaseous, and hazardous air emissions that would reach these sites. According to the WVDEP air permit, the Rockwool plant in Ranson is permitted to emit 250.87 tons of particulate matter per year into the air (1).

According to a recent study published in the journal of Veterinary Internal Medicine (2), horses are 15 times more sensitive to inhaled particulate matter than humans. Inhaled particulate matter can cause inflammation in horses' lungs that negatively affects performance. Inhaled particulate matter also contributes to the development of inflammatory airway disease (IAD) (3). IAD is a chronic airway disease that can affect horses long after their racing career is over. While there is little research on how other air pollutants affect horses, the effects of pollution on humans can be used to infer potential impact on horses. However unlike human models, these horses are elite athletes continuously exposed, and will thus likely experience detrimental effects at much lower levels of air pollution than humans.

The primary concern with air pollution is that increased levels of pollutants will increase inflammation in horses' lungs. Even small, subclinical amounts of inflammation in the lungs of horses negatively affect performance (2,3,4,5,6,11). This inflammation can also cause increased recovery times following racing (7,11). Reduced performance and training interruptions can lead to higher risk of injury, reduced winning average, fewer yearly starts, lower yearly

earnings, shortened career length, fewer lifetime starts, reduced lifetime earnings, and reduced quality of life (2,3,8,9,11). Each of these situations will lead to decreased return on investment, decreased cash flow, and decreased overall earnings for owners, trainers, and breeders with horses at Charles Town Races and in nearby areas.

While racing is usually a thoroughbred's first career, it is rarely their last. Some racing horses go on to be breeding stock, while others will have successful careers as sport horses. Jefferson County is an important source of new stock for sport horse trainers from Northern Virginia, and Maryland, and this is a resource for local horseman of both income and placement for horses not appropriate for breeding. However, if retired racehorses are unsound from injury or respiratory disease, they can be difficult to manage as breeding stock or unfit for a career as a sport horse. This affects the horse's quality of life and also places a burden on the industry locally and regionally.

The perception of decreased air quality from the increase in regional haze and visible smokestacks as one drives into the county will deter out of state owners and breeders from investing in West Virginia bred Race horses, decreasing or eliminating a critical \$50 million a year source of local business volume.

Another concern related to the proposed rezoning in Ranson is the risk of groundwater contamination as a result of the karst hydrogeology at the site and the industrial activity. Horsemen will either have to take on the expense of periodically testing water sources or they may not know local ground water is contaminated until their animals are sick. Veterinary care and testing adds expense and uncertainty to an industry that already deals with large inherent risks. The actual occurrence of ground water contamination would be devastating for Jefferson County's equine industry. For both geographic and financial reasons, it is simply impossible to think that the industry could solely use public or private utility-provided water if industrial activity fouled the local groundwater.

Finally, studies on US agricultural workers have demonstrated that increased air pollution decreases productivity of outdoors workers. This would place an additional burden on workers, small business owners and the industry.

The equine industry in Jefferson County is hundreds of years old. It is not worth risking this historic and economically valuable industry by rezoning for industrial companies like Rockwool. An economic impact study of the Charles Town Thoroughbred Horse Racing Industry on Jefferson County's economy found that the spending by owners, breeders, and trainers of the equine industry directly contributes \$79.4 million to the county each year. Out-of-state owners, breeders, and trainers spend more than \$50 million in Jefferson County every year. The value of total business volume in Jefferson County is \$191 million each year (10). These numbers do not include the effect of the handle or the casino.

The equine industry provides jobs for a broad cross-section of the public. This industry offers individuals of any educational background a variety of paths to achieve a good middle-income

living. Many jobs allow individuals to pursue apprenticeships or on-the-job training rather than requiring a costly college education. This flexibility allows for greater lifetime earnings and improved educational debt-to-earnings ratio for these workers. The equine industry also provides opportunities for non-traditional workers by offering job opportunities to those who may not be employable by larger corporations. This industry provides a variety of full-time, part-time, flexible, and pick-up work. Encouraging this type of flexible job ecosystem helps create a healthy economy with broad participation in employment and consumption.

The equine industry is a large conglomerate of small businesses, which have a multitude of economic benefits over having a few large businesses. It has been extensively reported that small locally owned businesses and start ups create more jobs, cultivate innovation, generate higher incomes, and provide more opportunities for individuals that would otherwise not exist than big non-local firms, which can actually depress local economies. The equine industry provides opportunities for small businesses and startups responsible for this growth of better jobs that are so good for the economy.

The equine industry offers so many other benefits that the industry in the rezoned area would not. Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would put at risk the health and well being of children of Jefferson County.

The type of industry that ordinance #2017-302 would allow in Ranson would generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. Exposure to these pollutants has devastating effects on children's health. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. Developing fetuses whose mothers are exposed to air pollution are more likely to have impaired organ development which can lead to early cognitive deficits, neurodevelopmental defects and other physical, cognitive, and psychological deficits later in life. An association between autism and prenatal exposure to particulate matter in air pollution has been demonstrated in several studies. Many studies have shown that lower test scores in math, English, and language arts are associated with exposure to outdoor air pollution. Industrial activity allowed by ordinance #2017-302 would also increase the risk of groundwater contamination in Ranson and nearby municipalities. Children whose families rely on well water, as is the case in much of Jefferson County, may be affected by polluted water. Voting no on ordinance #2017-302 will prevent air and water pollution from negatively affecting the long-term health of children in Jefferson County and surrounding areas.

The economic and environmental harm caused by the type of industry that ordinance #2017-302 would allow would put additional stress on the parents, caretakers, and teachers of children in affected areas. The weakening and destabilizing of this support network would have negative effects on local children. Many households in Jefferson County depend on the local agriculture, tourism, and equine industries for income. If industrial activity in Ranson depresses these industries, the resulting financial strain on these households will introduce additional

stress and uncertainty into children's lives. Households living in areas affected by particulate matter and regional haze will also suffer from the psychological effects of air pollution. Individuals living in areas with increase perception of pollution show increased levels of stress, anxiety, and unhappiness. School districts affected by increased air and water pollution may have trouble recruiting and retaining teachers. Teachers have a large influence on a child's daily life and, if educator quality and tenure decreases, the quality of this influence will diminish.

The site of the proposed rezoning in Ranson is across the road from an elementary school and proximal to lower-income neighborhoods. Observations like these demonstrate how ordinance #2017-302 would disproportionately affect vulnerable and historically-disadvantaged populations. The damaging health effects of air pollution have been shown to persist for at least three generations, so allowing certain types of industry in low-income areas would only compound existing disadvantages. Voting no on ordinance #2017-302 would be a step towards acknowledging that all individuals have the right to clean air and water.

Children face increased exposure to air pollution, groundwater contamination, financial instability, and environmental discrimination if ordinance #2017-302 is passed. Please vote no on ordinance #2017-302.

Sincerely,

Jean Anne Pugh

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on #2017-302. The air emissions, possibility of ground and surface water contamination, and their effect on our interwoven economies threaten the health, safety and welfare of not just Jefferson County but the greater region, including Loudoun and the greater Northern Virginia area.

This zoning would provide for industry that produces large amounts of air emissions. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. Northern Virginia is directly downwind from these emissions. Much of the gaseous, fine particulate, and hazardous emissions can reach Northern Virginia. Further affecting the outdoor air quality of the adjacent portion of Virginia and the ability of these areas to achieve and maintain National Ambient Air Quality Standards (NAAQS) attainment. This will affect agriculture and outdoor leisure and recreation.

For example, Loudoun County has been in nonattainment for the NAAQS 8-hour Ozone standard for the past two years. VOC and NO_x react after they have been emitted to produce ground level ozone. The industry that this rezoning would provide for would produce large amounts of these emissions. This would make it even harder as Loudoun County tries to achieve attainment. As time goes on and the scientific research advances our knowledge and understanding of the extent to which gaseous, particulate and hazardous emissions affect human health the NAAQS standards are likely to be reduced. The effects on air emission from this rezoning will make it only harder for Loudoun and Northern Virginia to meet these standards.

In addition to the concerns about the air, the possible ground and surface water contamination is very concerning to Loudoun and Virginia residents. The site is known to have ground water that is vulnerable to contamination due to the karst hydrogeology. A USGS study demonstrated that the ground water adjacent to the site to be rezoned communicates readily with surface

water tributaries of the Potomac River. In addition to direct infiltration where water moves directly from the surface to groundwater via porous limestone bedrock, karst is known to have severe ground instability problems. This makes karst geology prone to sinkhole development. Sinkholes provide direct connection between the surface water and any contaminants it may contain and the groundwater. This makes the aquifer vulnerability in karst areas very high, and contamination with industrial activity such as that provided for by this rezoning too likely.

Loudoun sources its drinking water from the Potomac River, downstream of many West Virginia tributaries that carry water from the epikarst and groundwater aquifer at the site to be rezoned. Loudoun has recently completed the new Trap Rock Water Treatment facility, which draws water from the Potomac River. Loudoun currently provides 40 million gallons and projects to provide 90 million gallons of drinking water a day to customers by 2040 (Loudounwater.org). Therefore, the viability of the Potomac River is a high priority for Virginia residents.

Loudoun and Northern Virginia is one of the fastest growing communities in the country and provides a lot to Jefferson County in their symbiotic relationship. Virginia residents support and enjoy Jefferson County through tourism, as our residents enjoy the natural and historical resources of your county. Virginia residents and businesses support the equine industry in a multitude of ways from providing wagering fans at the races to the Virginia Breeders Association Virginia Certified incentive programs and a strong market for retired racehorses. According to an economic impact study from WVU, at least 40% of Jefferson County residents travel outside of West Virginia for work, a good percentage of those travel to northern Virginia. This rezoning would allow for industry that would negatively affect the economy of both places and this relationship and the benefits for our residents gleaned from it.

This zoning change will provide for industry that will negatively effect the health safety and welfare of the Loudon and Northern Virginia community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Donald Brizendine

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask that you vote no on Ordinance #2017-302. While not in Ranson, the land and homes around the property that is the subject of the zoning change are closer to the property than anyone who currently lives within the city limits of Ranson. This area will be affected sooner and more harshly by the environmental issues that will develop secondary to the inappropriate siting of industry this zoning would allow.

The subject land has been well studied by Drs. Kozar, Doctor and Doctor and described in the scientific literature and USGS reports as having karst hydrology with very high aquifer vulnerability. The karst landscape is a consequence of the presence of soluble bedrock, which consists of limestone in the case of the subject land. In such landscapes water percolates through the ground and dissolves the underlying rock creating a porous network of caverns and throughways. Karst aquifers are known to be "extremely vulnerable to pollution" due to direct connection between the surface water and groundwater through both point (sinkholes) and diffuse (everywhere) infiltration. It is known from the Voluntary Remediation Plan of Jefferson Orchard that the groundwater at the subject site is only 60 feet below the ground. The subject property and much of the property around it are on an upland plain with few surface streams, but great seasonal variability in the water table resulting in numerous esteves and large amounts of water in the epikarst. This water is easily contaminated and this contamination spreads quickly throughout the aquifer. Dye tests performed near the subject site by the USGS have demonstrated this quick moving thorough dispersment in the aquifer in this area. While this contamination goes on to affect springs at the margins of the upland area continuing on in streams that service municipal water sources and the Potomac River, our concerns are far more immediate in both time and distance. Well water is the only water source available in the area of the proposed zoning change and, with the exception of Fox Glen, a majority of this water is supplied by private wells. Therefore, the groundwater aquifer fulfills a critical necessity, fulfilling all needs including human consumption, household uses, and agriculture and

maintenance of livestock and horses in the immediate area around the site. The concern is that if the aquifer becomes contaminated, then the local drinking water will be fouled.

For decades now, policy makers have been using “Aquifer Vulnerability,” to set land use and water resource protection policy. Karst has very high Aquifer Vulnerability. Therefore, this industrial use is not appropriate for this land and it should not be zoned for it. The guiding documents of the WVDEP recognize this. The introduction to the WVDEP document *Stormwater Management Design in Karst Areas* states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.”

The Chesapeake Bay Stormwater Network karst stormwater guidance document the *CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed*, which the WVDEP cites in its own guiding document *Stormwater Management Design in Karst Areas*, clearly agrees stating

“First, the effect of land development on karst terrain is complex and hard to predict, and requires professional analysis to reduce the risk of geological hazards, damage to infrastructure and groundwater contamination.”

“The working group acknowledges that past approaches to stormwater and land development in karst terrain have been inadequate to safeguard the public and the environment.”

“...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.”

We clearly need stronger comprehensive land use plans and zoning that direct new growth away from karst areas to more appropriate locations. Ordinance #2017-302 is literally the opposite of this.

Further, we cannot rely on the WVDEP to do the job that good local land use guidelines and zoning should do. For example, the *CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed* states that detention and retention ponds are not recommended on karst and categorize them as discouraged. Also, quoting WVDEP’s own karst guidance: “attenuating surface runoff will increase the rate of sinkhole formation and potential groundwater contamination.” Yet the entity currently planning to utilize this zoning change is planning employment of multiple massive retention ponds and attenuating surface runoff completely. This has already been approved by the DEP in two Construction Stormwater General Permit registrations for that company. One of detention ponds is not even regulated by the DEP as it contains process water and has no outlet. Clearly the DEP recognizes the risks but is not appropriately limiting them. Relying on the DEP to protect the public health, safety, welfare, and the environment from any entity in these karst locations is simply as the CNS bulletin said it “inadequate to safeguard the public and the environment.” We must have appropriate zoning that takes into consideration appropriate use of land with karst

hydrogeology. Ordinance #2017-302 does not do this, but instead increases the risk to the public and the environment.

A second serious concern is the air emissions from the industry that this zoning will provide for. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. These types of air emissions have been shown to increase the risk of, contribute to, and exacerbate a multitude of developmental, physical, physiological, physiological, cognitive and economic. The exposure of one individual can cause repercussions in multiple generations. Embryos, fetuses, and children are most vulnerable with effects born out over a lifetime, and that of their offspring. Many of these effects only require short-term exposure and some have even been shown to occur at levels below current limits recommended by the World Health Organization. One example of this is that a recent study found that “Even within the limits set by the World Health Organization, the pollutants PM10, SO₂, NO₂, and O₃ are associated with increased risk of treatment for respiratory diseases in children 0 to 6 years of age.” Unfortunately, the US limits are higher than WHO, 300 % higher in the case of PM10!

In fact, in 2019, in the Advice from the Independent Particulate Matter Review Panel (formerly U.S. EPA Clean Air Scientific Advisory Committee Particulate Matter Review Panel) on EPA’s Policy Assessment for the Review of the National Ambient Air Quality Standards for Particulate Matter, it stated that the committee unanimously and unequivocally found that the current primary annual and 24-hour PM_{2.5} National Ambient Air Quality Standards (NAAQS) are not adequate to protect public health. The advice from this 20-member committee, whose scientific disciplines include epidemiology, medicine, toxicology, air quality measurement, air quality modeling, exposure assessment measurement and modeling, risk assessment, statistics, and others, was ignored due presumably to political pressure. Not only are the NAAQS too high in some cases, but due to the measure and mechanism by which they work, they can not replace the safety provided by good land use and zoning regulations, that are meant to do things like keep factories with air emissions and hundreds of heavy trucks away from elementary schools. In fact, there is a state law that prohibits siting a school near a factory. Unfortunately, the reciprocal law does not exist. Clearly, just like with the water resources, we cannot rely on the DEP or the EPA to do the job of what appropriate zoning should do. The whole point of zoning is to keep people safe and provide for their health and welfare. Ordinance #2017-302 puts families and school children directly in harms way.

The air emissions, threat to the groundwater, and the very presence of the industry that this zoning change will allow for will have a serious negative economic effect on those who live and or work closest to the site in question. Productivity and workforce participation will be negatively affected by the health effects of the air emissions. The local agricultural operations will be negatively affected by the air emissions with lower quantity and quality of crop yield and would be devastated if the ground water aquifer were fouled. The equine operations in the area, of which there are several, will be negatively affected by the air emissions as they affect the horses’ health and performance. The mere presence of the industry that will be provided

for by this zoning change will cause property values to fall. There will be serious economic consequences for the immediate area around the site in question.

Several of the communities in the immediate area of the site for proposed zoning change are traditionally underserved and have lower economic status. The choice of this location for such a zoning change represents an egregious example of environmental injustice that should not be promulgated or tolerated.

This zoning change will provide for industry that will negatively affect the health safety and welfare of our community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Jaime Schwartzbeck

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on #2017-302. The air emissions, possibility of ground and surface water contamination, and their effect on our interwoven economies threaten the health, safety and welfare of not just Jefferson County but the greater region, including Loudoun and the greater Northern Virginia area.

This zoning would provide for industry that produces large amounts of air emissions. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. Northern Virginia is directly downwind from these emissions. Much of the gaseous, fine particulate, and hazardous emissions can reach Northern Virginia. Further affecting the outdoor air quality of the adjacent portion of Virginia and the ability of these areas to achieve and maintain National Ambient Air Quality Standards (NAAQS) attainment. This will affect agriculture and outdoor leisure and recreation.

For example, Loudoun County has been in nonattainment for the NAAQS 8-hour Ozone standard for the past two years. VOC and NO_x react after they have been emitted to produce ground level ozone. The industry that this rezoning would provide for would produce large amounts of these emissions. This would make it even harder as Loudoun County tries to achieve attainment. As time goes on and the scientific research advances our knowledge and understanding of the extent to which gaseous, particulate and hazardous emissions affect human health the NAAQS standards are likely to be reduced. The effects on air emission from this rezoning will make it only harder for Loudoun and Northern Virginia to meet these standards.

In addition to the concerns about the air, the possible ground and surface water contamination is very concerning to Loudoun and Virginia residents. The site is known to have ground water that is vulnerable to contamination due to the karst hydrogeology. A USGS study demonstrated that the ground water adjacent to the site to be rezoned communicates readily with surface

water tributaries of the Potomac River. In addition to direct infiltration where water moves directly from the surface to groundwater via porous limestone bedrock, karst is known to have severe ground instability problems. This makes karst geology prone to sinkhole development. Sinkholes provide direct connection between the surface water and any contaminants it may contain and the groundwater. This makes the aquifer vulnerability in karst areas very high, and contamination with industrial activity such as that provided for by this rezoning too likely.

Loudoun sources its drinking water from the Potomac River, downstream of many West Virginia tributaries that carry water from the epikarst and groundwater aquifer at the site to be rezoned. Loudoun has recently completed the new Trap Rock Water Treatment facility, which draws water from the Potomac River. Loudoun currently provides 40 million gallons and projects to provide 90 million gallons of drinking water a day to customers by 2040 (Loudounwater.org). Therefore, the viability of the Potomac River is a high priority for Virginia residents.

Loudoun and Northern Virginia is one of the fastest growing communities in the country and provides a lot to Jefferson County in their symbiotic relationship. Virginia residents support and enjoy Jefferson County through tourism, as our residents enjoy the natural and historical resources of your county. Virginia residents and businesses support the equine industry in a multitude of ways from providing wagering fans at the races to the Virginia Breeders Association Virginia Certified incentive programs and a strong market for retired racehorses. According to an economic impact study from WVU, at least 40% of Jefferson County residents travel outside of West Virginia for work, a good percentage of those travel to northern Virginia. This rezoning would allow for industry that would negatively affect the economy of both places and this relationship and the benefits for our residents gleaned from it.

This zoning change will provide for industry that will negatively effect the health safety and welfare of the Loudon and Northern Virginia community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Jennifer Wellock
Hillsboro, 20132

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would negatively affect tourism, economic agility, groundwater quality, and individual health in neighboring municipalities like Shepherdstown.

Tourism is critically important to Shepherdstown's economy and to the county as a whole. In 2018, tourist spending in the Jefferson County contributed over \$170 million to state and local government revenue and \$213 million in individual earnings. Importantly, most of this money comes from tourists visiting from neighboring states like Virginia, Maryland, and Washington D.C. Out-of-state tourists are largely drawn to Jefferson County because of its reputation for environmental-friendly, sustainable industry. Key elements that support this reputation include the county's pastoral scenery and pristine natural resources. Ordinance #2017-302 will allow industry into Jefferson County that risks harming these elements and dramatically reducing the area's appeal to visitors. The resulting harm to our tourist industry would drive away visitors and decrease state, county, and local revenue. The long-term success of Jefferson County's tourism industry is dependent on local governments making coordinated zoning decisions. Allowing certain types in industry in Ranson will negatively affect tourism in every municipality throughout the county, including Shepherdstown. Voting no on ordinance #2017-302 will protect the foundations of the county's tourism industry and protect the 7,040 jobs in Jefferson County that are directly supported by tourism.

The type of large, consolidated industry that ordinance #2017-302 would allow in Ranson would generally reduce the flexibility of local economies in Jefferson County. Historically, the driving industries in Jefferson County have been tourism, agriculture, and the equine industries. These three industries are large conglomerates of small businesses. Small business is very important to Sheherdstown. Small businesses have been shown to create more jobs, cultivate more innovation, and provide more opportunities than big, non-local firms. Additionally, small businesses have been shown to more reactive to sudden changes relative to manufacturing

businesses. Bringing large, manufacturing-based industry into Jefferson county will depress the local economy and stifle innovation. During this time of economic upheaval and uncertainty, Jefferson County needs to support industries that will allow local economies to adapt and recover as fast as possible.

Voting no on ordinance #2017-302 will help protect water resources throughout Jefferson County. The type of industry that ordinance #2017-302 would allow puts the ground resources of Jefferson county at significant risk due to the karst hydrogeology. The site in Ranson is in the Rocky Marsh Run watershed, which is in the source water protection zone for Shepherdstown and drains to the Potomac River. Therefore, activity at this site will affect both groundwater and surface water streams. In municipalities like Shepherdstown, many residents and nearby farms depend on wells for water. Contamination of groundwater aquifers would create both health and remediation concerns for local residents. Dye tests performed by the USGS near the area of proposed rezoning in Ranson have shown just how far-reaching groundwater contamination at the Ranson site could be. Results from the USGS study revealed measurable dye concentrations in Elk's Run, Rattlesnake Run, and even the Shepherdstown Town Run. This last run cuts through the center of Shepherdstown and is a favorite area for children to play and learn to fish.

Groundwater pollution is not the only concern for communities like Shepherdstown. The type of industry that ordinance #2017-302 would allow in Ranson would also generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. These pollutants are particularly harmful to children. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. The site in Ranson is across the road from an elementary school and also within the Jefferson High Middle district. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of children in Shepherdstown and all of Jefferson County.

I again request that you vote no on ordinance #2017-302. The long-term economic, environmental, and community health of municipalities like Shepherdstown depend on Ranson's participation in a coordinated zoning plan for all of Jefferson County.

As a long time resident of Jefferson County I would like my children to experience the beauty that I did as a child growing up here. I would like them to breathe clean air and confidently drink the water without fear that the aquifer isn't pure and safe of damaging chemicals and waste. Please consider the quality of life that we have come to expect and do not spoil it to enrich the few. We can do better."

","13","Sheila","Vertino","sheilavertino@yahoo.com","SHEPHERDSTOWN","25443","","2020-06-15 19:52:45","","Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

So many reasons to vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would negatively affect tourism, economic agility, groundwater quality, and individual health in neighboring municipalities like Shepherdstown.

Tourism is critically important to Shepherdstown's economy and to the county as a whole. In 2018, tourist spending in the Jefferson County contributed over \$170 million to state and local government revenue and \$213 million in individual earnings. Importantly, most of this money comes from tourists visiting from neighboring states like Virginia, Maryland, and Washington D.C. Out-of-state tourists are largely drawn to Jefferson County because of its reputation for environmental-friendly, sustainable industry. Key elements that support this reputation include the county's pastoral scenery and pristine natural resources. Ordinance #2017-302 will allow industry into Jefferson County that risks harming these elements and dramatically reducing the area's appeal to visitors. The resulting harm to our tourist industry would drive away visitors and decrease state, county, and local revenue. The long-term success of Jefferson County's tourism industry is dependent on local governments making coordinated zoning decisions. Allowing certain types in industry in Ranson will negatively affect tourism in every municipality throughout the county, including Shepherdstown. Voting no on ordinance #2017-302 will protect the foundations of the county's tourism industry and protect the 7,040 jobs in Jefferson County that are directly supported by tourism.

The type of large, consolidated industry that ordinance #2017-302 would allow in Ranson would generally reduce the flexibility of local economies in Jefferson County. Historically, the driving industries in Jefferson County have been tourism, agriculture, and the equine industries. These three industries are large conglomerates of small businesses. Small business is very important to Shepherdstown. Small businesses have been shown to create more jobs, cultivate more innovation, and provide more opportunities than big, non-local firms. Additionally, small businesses have been shown to more reactive to sudden changes relative to manufacturing businesses. Bringing large, manufacturing-based industry into Jefferson county will depress the local economy and stifle innovation. During this time of economic upheaval and uncertainty, Jefferson County needs to support industries that will allow local economies to adapt and recover as fast as possible.

Voting no on ordinance #2017-302 will help protect water resources throughout Jefferson County. The type of industry that ordinance #2017-302 would allow puts the ground resources of Jefferson county at significant risk due to the karst hydrogeology. Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on Ordinance #2017-302. Ranson's proposed zoning change presents a significant risk to the equine industry in Jefferson County and well beyond. The type of industry that would be allowed by the proposed zoning change in this location would jeopardize horse health, the groundwater supply, and workforce productivity. This will cause immediate shrinkage and threaten the long-term viability of the equine industry in the county.

The site of the proposed rezoning is less than six miles from Charles Town Races, with several breeding, training, and rehabilitation facilities between the two. The industry allowed by this rezoning would produce particulate, gaseous, and hazardous air emissions that would reach these sites. According to the WVDEP air permit, the Rockwool plant in Ranson is permitted to emit 250.87 tons of particulate matter per year into the air (1).

According to a recent study published in the journal of Veterinary Internal Medicine (2), horses are 15 times more sensitive to inhaled particulate matter than humans. Inhaled particulate matter can cause inflammation in horses' lungs that negatively affects performance. Inhaled particulate matter also contributes to the development of inflammatory airway disease (IAD) (3). IAD is a chronic airway disease that can affect horses long after their racing career is over. While there is little research on how other air pollutants affect horses, the effects of pollution on humans can be used to infer potential impact on horses. However unlike human models, these horses are elite athletes continuously exposed, and will thus likely experience detrimental effects at much lower levels of air pollution than humans.

The primary concern with air pollution is that increased levels of pollutants will increase inflammation in horses' lungs. Even small, subclinical amounts of inflammation in the lungs of horses negatively affect performance (2,3,4,5,6,11). This inflammation can also cause increased recovery times following racing (7,11). Reduced performance and training interruptions can lead to higher risk of injury, reduced winning average, fewer yearly starts, lower yearly

earnings, shortened career length, fewer lifetime starts, reduced lifetime earnings, and reduced quality of life (2,3,8,9,11). Each of these situations will lead to decreased return on investment, decreased cash flow, and decreased overall earnings for owners, trainers, and breeders with horses at Charles Town Races and in nearby areas.

While racing is usually a thoroughbred's first career, it is rarely their last. Some racing horses go on to be breeding stock, while others will have successful careers as sport horses. Jefferson County is an important source of new stock for sport horse trainers from Northern Virginia, and Maryland, and this is a resource for local horseman of both income and placement for horses not appropriate for breeding. However, if retired racehorses are unsound from injury or respiratory disease, they can be difficult to manage as breeding stock or unfit for a career as a sport horse. This affects the horse's quality of life and also places a burden on the industry locally and regionally.

The perception of decreased air quality from the increase in regional haze and visible smokestacks as one drives into the county will deter out of state owners and breeders from investing in West Virginia bred Race horses, decreasing or eliminating a critical \$50 million a year source of local business volume.

Another concern related to the proposed rezoning in Ranson is the risk of groundwater contamination as a result of the karst hydrogeology at the site and the industrial activity. Horsemen will either have to take on the expense of periodically testing water sources or they may not know local ground water is contaminated until their animals are sick. Veterinary care and testing adds expense and uncertainty to an industry that already deals with large inherent risks. The actual occurrence of ground water contamination would be devastating for Jefferson County's equine industry. For both geographic and financial reasons, it is simply impossible to think that the industry could solely use public or private utility-provided water if industrial activity fouled the local groundwater.

Finally, studies on US agricultural workers have demonstrated that increased air pollution decreases productivity of outdoors workers. This would place an additional burden on workers, small business owners and the industry.

The equine industry in Jefferson County is hundreds of years old. It is not worth risking this historic and economically valuable industry by rezoning for industrial companies like Rockwool. An economic impact study of the Charles Town Thoroughbred Horse Racing Industry on Jefferson County's economy found that the spending by owners, breeders, and trainers of the equine industry directly contributes \$79.4 million to the county each year. Out-of-state owners, breeders, and trainers spend more than \$50 million in Jefferson County every year. The value of total business volume in Jefferson County is \$191 million each year (10). These numbers do not include the effect of the handle or the casino.

The equine industry provides jobs for a broad cross-section of the public. This industry offers individuals of any educational background a variety of paths to achieve a good middle-income

living. Many jobs allow individuals to pursue apprenticeships or on-the-job training rather than requiring a costly college education. This flexibility allows for greater lifetime earnings and improved educational debt-to-earnings ratio for these workers. The equine industry also provides opportunities for non-traditional workers by offering job opportunities to those who may not be employable by larger corporations. This industry provides a variety of full-time, part-time, flexible, and pick-up work. Encouraging this type of flexible job ecosystem helps create a healthy economy with broad participation in employment and consumption.

The equine industry is a large conglomerate of small businesses, which have a multitude of economic benefits over having a few large businesses. It has been extensively reported that small locally owned businesses and start ups create more jobs, cultivate innovation, generate higher incomes, and provide more opportunities for individuals that would otherwise not exist than big non-local firms, which can actually depress local economies. The equine industry provides opportunities for small businesses and startups responsible for this growth of better jobs that are so good for the economy.

The equine industry offers so many other benefits that the industry in the rezoned area would not. For example, the equine industry supports local agriculture by providing a market for agricultural goods such as straw. The robust straw market supported by owners, trainers, and breeders allows for a third cash crop to be produced from one field in a year. Through pastureland and support of local agricultural goods, the equine industry protects and preserves the open spaces that give our county its bucolic quality and help attract tourists. Through the breeders' incentive programs, the equine industry offers unique opportunities to draft state funds back to Jefferson County, to name a few.

Rezoning this area of Ranson for Special District Industrial will allow in entities whose activities are harmful to the equine industry. The losses incurred by the equine industry would far outweigh any benefits derived from industries occupying the rezoned area. Sacrificing the long-term viability of one of our oldest and most productive industries for a net loss in business volume and economic value just does not make good sense for the local economy. Please vote NO on Ordinance #2017-302.

Sincerely,

Marissa Baderschneider

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask you to vote NO on Ordinance #2017-302. The industry this zoning change will allow for endangers the health, safety and, welfare of the community, and violates the premise of the smart code zoning that we have spent so much time, effort and federal money employing.

Any change in zoning needs to align with the comprehensive plan. In Ranson's current comprehensive plan (2012), the city only refers to "heavy industry" in the history section. Here it is characterized as part of a bygone era that has been replaced by an emphasis on agriculture for local food production, open spaces, and quality-of-life. In the remainder of the document, the word industry is used loosely to describe businesses including flower shops and shoe stores. Nothing that resembles the industry that this zoning change will provide for is described in the current comprehensive plan of Ranson.

In the land use section of the comprehensive plan, number ten states:

"Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The comprehensive plan clearly states that the city will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community. This change in zoning clearly negatively affects the health, safety, and welfare of the community.

As the zoning is proposed, the industry that this zoning change will allow for will be directly across the street from houses, parks and other small businesses. A densely populated subdivision and an elementary school already exit directly across the street. While these latter

community sections are not in the city limits, the effect of this zoning on them should still be considered just the same as it would be if they were in the city limits.

The industry that this zoning change will provide for will produce particulate, gaseous, and hazardous air emissions. These emissions have been shown to be detrimental to human health at every stage of life from embryo to old age. In utero and childhood exposure are the most damaging with lasting effects being realized through out life, and with maternal exposure the effects can be felt for generations. Multiple organ systems are affected including respiratory, cardiovascular, neurologic, immune, and endocrine causing defects in multiple processes including in utero development, neurodevelopment, immune and tolerance development, and cognitive defects. There are also psychological, social, and economic effects from both perceived and actual air pollution in both children and adults. Many of these effects can be seen even with short-term exposure or exposure that is lower than the levels recommended by the US Environmental Protection Agency and World Health Organization. These consequences are devastating to the individual and depressing to the local community and economy. State law does not allow a school to be built next to industry that this zoning will allow but yet we are contemplating changing the zoning so this industry can build next to a school. This does not make sense. As Ranson residents, we want Ranson to follow the lead of the state and keep polluting industry away from kids. In these ways, this change in zoning will negatively affect the health and welfare of the community.

In addition to the health effects of the air emissions is the threat to groundwater from the industry that this zoning change would allow. The land in question has karst hydrogeology and therefore very high aquifer vulnerability and is not appropriate for this industry. With the type of industry this zoning will provide for, combined with high aquifer vulnerability, the likelihood of groundwater contamination is too high for the community and region to bear. A USGS study demonstrated that contamination in the groundwater adjacent to the site moves relatively quickly and can be found in wells and surface water structures in a variety of locations in the County. In this way, contamination at the site would affect the drinking water of the great majority of Jefferson County residents. Through the surface water connections, the water at the site also affects the water resources of the region.

Aquifer vulnerability has been used by policy makers for decades to set land use regulations. The guiding document, from the WVDEP, Stormwater Management Design in Karst Areas states, "it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." In Ranson, we need to follow this advice and not change the zoning of this land for use by industry that has among the highest aquifer vulnerability in the County. This zoning change will endanger the safety of the community and region by endangering the safe water resources. As Ranson residents, we want to safeguard the water resources of the county and region by following the WVDEP guidance here.

Further, by reallocating this transect district and replacing it with a monolithic block of Special District Industrial designation, hundreds of housing units, parks and space for small businesses are lost. Ranson loses the potential for property tax on these properties and their improvements, Business and Occupational tax on the businesses and sales tax in retail stores. The community loses out on the opportunity to develop affordable housing and create locations where people can live, work, play, and shop all in the same place reducing the need for travel.

Worse yet apparently a deal has been made where the entity that owns the subject land has required that a litany of things not be built on the adjacent land essentially stripping the purpose of the smart code transect zone that exists there. Transect zones in the smart code are meant to transition, from out to in, and provide communities where people can safely work and live in close proximity in an effort to reduce travel. Excluding many of the components of the transect zone effectively eliminates the features that make it a transect zone, thus, losing the benefits a transect zone offers the community and city. By losing these benefits, reducing the overall and affordable housing prospects, and reducing so drastically the opportunities for city income, this zoning change will negatively affect the welfare of the community.

As Ranson residents, we find it odd that we are changing zoning to provide for industry that we would not put in the middle of our town close to our residents, but we are placing it close to the homes of county residents. Further, it is striking that the area where this change in zoning is directly adjacent to historically underserved lower income communities and a Title I school. This amounts to environmental injustice and cannot be tolerated.

The purpose of zoning is for a city to protect the health, welfare, morals and safety of the community. In this case, the air emissions and heavy truck traffic will endanger the communities' health. The threat of water contamination will endanger the safety of the community. The effect of lost productivity and decreased workforce participation due to increased illness and the negative effect the air emissions and presence of such a factory will have on the local economy will negatively affect the welfare of the community. The environmental injustice of changing the zoning to accommodate such polluting industry in a location where your municipality has no residents, but yet hundreds of low income and underserved county residents live is egregiously amoral. This must not happen. We respectfully implore you to do the right thing and vote no on ordinance #2017-302.

Sincerely,

MJ Serfin

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

This land and this location are not appropriate for the industry this zoning change will allow. The hydrogeology of the land combined with such industrial activity risks the safety of our water supply. The air emissions from this industry will negatively impact our physical and mental health, our children's ability to achieve, our ability to make a living, our happiness, and it will do this for generations even after we leave or the pollution stops. It is not lost on us that this zoning change is being made next to our neighborhood and not next to the residents of Ranson, yet Ranson is in control. This is not right. We respectfully ask you to vote NO on ordinance #2017-302.

The land at the site in question is not just ill-suited, but completely inappropriate for the industry this zoning change will allow. This land has karst hydrogeology. As such, the ground itself is very unstable and readily develops sinkholes. This land has been described by a 2012 study to be exceptionally susceptible to sinkhole formation, more so than most of the rest of the county. Sinkholes provide point infiltration of surface water into the water in the epikarst. The porous bedrock allows diffuse infiltration of surface water into the epikarst water. At this site, there is also large amounts of water in the epikarst and it is only 60 feet from the surface. This allows the water at the surface to easily communicate with the water in the epikarst and the groundwater aquifer carrying any surface water contaminants with it.

The industrial activity this zoning change will allow for will cause ample surface water contamination from ground level industrial activities, raw material and waste storage and particulate matter falling to the ground from the air emissions. The industry that is currently planning to utilize this zoning change should be designated a stormwater hotspot just for this reason. The WVDEP should require them to treat all water before it is allowed to infiltrate the ground, but so far, this has not been done. The WVDEP actually recommends that areas like this not be developed due to the risk to groundwater. Their guiding document, *Stormwater Management Design in Karst Areas* states, "it is important to note that the potential for

geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that the best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” This guidance should be followed; clearly we cannot expect the DEP to protect us from inappropriate zoning changes.

The wellhead protection area for the Fox Glen’s well and that of the elementary school where our children go to school intersects with the land where the zoning change is being proposed. However, a USGS study has shown that the groundwater aquifer here moves relatively fast and so contamination throughout this property is a concern for our water quality. This zoning change will clearly endanger the safety of our water supply. If the well at Fox Glen is contaminated and the utility is forced to divert water from further away, this may be used as evidence at the Public Service Commission to raise the water tariff on Fox Glen residents. This is an increase many will not be able to afford, raising the risk of water insecurity.

The air emissions that will be produced by the industry that this zoning will allow include gaseous (SO_2 , NO_2 , O_3 (VOC and NO_x)), particulate matter (PM_{10} , $\text{PM}_{2.5}$, $\text{PM}_{0.1}$), and hazardous emissions (neurotoxins and carcinogens). We will be exposed through our lungs from the air we breathe, through our skin from the air and things we contact, and through contaminated things we may ingest. Our kids will be more exposed because they spend more time playing outside and on the ground and kids like to put things in their mouth. In fact, according to the National Academy of Science, our kids are more at risk because they breathe more air per pound than adults, their detoxification pathways are less mature, they are growing and developing and these processes are more sensitive, and they have more years to live yet and thus more years to develop slow onset diseases. Exposure to air pollution in early human development, especially exposure to fine particulate pollution, can be extremely deleterious to children's health and development.

The negative effects start in utero. Embryonic and fetal cells are exquisitely sensitive and are affected directly by inhaled pollutants that cross the placenta like fine particulate matter as well as other secondary pathways causing impaired organ development, disturbed development of the immune system, premature birth, lower birth weight, and increased infant mortality. These early changes lead to long-term effects including increased disease development in multiple organ systems throughout life, cognitive defects, achievement deficits, and negative psychological social and economic effects.

Fetal and early life exposure to air pollution causes inappropriate brain growth and maturation in early life, neurodevelopmental disorders, early cognitive deficits, and has been associated with autism by several case-control studies. Several studies have demonstrated a scholastic deficit in exposed children for almost all subject matter and at a variety of grade levels. The cause of these findings are multifactorial and researchers suggested they include exacerbation of asthma symptoms, other decreased health parameters, increased fatigue, increased absence, or a direct neurodegenerative effect, all caused by or contributed to by the exposure to air pollution.

Development of the respiratory system starts in utero, is 80% complete by age 6, and continues to early 20s. A review by Korten et. al. in 2017 explained that exposure to air pollution during the first 6 years of life can damage the lung tissue, impair lung growth, and alter the development of immune function and repair mechanisms within the lungs. These effects increase both short- and long-term risk for asthma, chronic obstructive pulmonary disease (COPD), lung cancer, and respiratory infections. Exposure to outdoor air pollution not only increased the risk of these diseases, but exacerbates existing disease increasing severity of symptoms, hospital visits, and death due to these diseases. A 2019 study found “even within the limits set by the World Health Organization, the pollutants PM10, SO2, NO2, and O3 are associated with increased risk of treatment for respiratory diseases in children 0 to 6 years of age.” It is important to note that the US limits are set higher than the WHO, 300% higher in the case of PM10!

There are a multitude of other physiologic effects of air pollution that cause increased rates of morbidity and mortality in both adults and children. Air pollutants are associated with increased risk of autoimmune diseases like asthma, allergies, and eczema. Air pollution has deleterious effects on the cardiovascular system, endocrine system and blood, contributing to the occurrence of high blood pressure, high cholesterol, obesity, anemia, and stroke.

There are psychological effects as well. A review, of 178 published articles by Lu published in 2020, systematically examined the psychological (affective, cognitive, behavioral), economic, and social effects of air pollution and found: “Affectively, air pollution decreases happiness and life satisfaction, and increases annoyance, anxiety, mental disorders, self-harm, and suicide. Cognitively, it impairs cognitive functioning and decision making. Behaviorally, air pollution triggers avoidance behavior, defensive expenditure, and migration as coping strategies. Economically, it hurts work productivity and stock markets. Socially, it exacerbates criminal activities and worsens perception of the government. Importantly, both actual and perceived air pollution levels matter.”

Through negative physical and mental health effects air pollution has been shown to decrease an individual’s productivity and ability to participate in the workforce, negatively impacting workforce availability and overall productivity. This negatively impacts individual workers, companies, and the local economy. It also decreases individual’s ability to relocate themselves or their family into an area less affected by pollution. In this way a vicious cycle is set up where successive generations are exposed to the same pollutants and experience the negative effects of the ongoing exposure to pollution. This is not a fate the children of Fox Glen deserve to have thrust upon them by this zoning change and the industry that it will allow into our bucolic county. An editorial in the *New England Journal of Medicine*, commenting on several recent studies, stated: “The best control strategy from the standpoint of human health, supported by the scientific evidence to date, is to reduce the levels of all types of air pollutants. Our children’s health depends on it.”

The area surrounding the location, of the proposed zoning change that will accommodate heavier types of industry, is historically lower income and underserved. Deciding to locate a tract of such zoning in this location when it is on the whole unwanted and totally inappropriate for the land and surroundings is an example of environmental injustice. The Lancet Commission on Pollution and Health, citing the United Nation's Universal Declaration of 1948 on Human Rights, found that "pollution threatens fundamental human rights - the right to life, the right to health, the right to well-being, and the rights of the child." This rezoning represents not only a bygone era of economic development but a bygone era of environmental injustice and human rights violation.

The Lancet Commission on Pollution and Health further found that prevention of non-communicable diseases will require pollution prevention and that this will require fundamental changes in societal patterns of production, consumption, and transportation. This will require a paradigm shift to a more sustainable economic model based on recognition of human rights. They also found this is a major unexploited opportunity in society that many communities are grappling with undertaking. The movement away from the smart code zoning, with it integrated walkable communities, to large tracts of land dedicated to polluting industry close to a title one school is the exact opposite of this. This rezoning would represent a major step in the wrong direction for disease prevention, human rights, Ranson, and Jefferson County!

This change in zoning is not appropriate for this land and this area. This land itself is not well suited for the industry this zoning change would allow. This industry would severely adversely affect the health, safety and welfare of our community. Please vote NO on the Ordinance #2017-302.

Sincerely,

Jenifer Sonifrank

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would negatively affect tourism, economic agility, groundwater quality, and individual health in neighboring municipalities like Shepherdstown.

Tourism is critically important to Shepherdstown's economy and to the county as a whole. In 2018, tourist spending in the Jefferson County contributed over \$170 million to state and local government revenue and \$213 million in individual earnings. Importantly, most of this money comes from tourists visiting from neighboring states like Virginia, Maryland, and Washington D.C. Out-of-state tourists are largely drawn to Jefferson County because of its reputation for environmental-friendly, sustainable industry. Key elements that support this reputation include the county's pastoral scenery and pristine natural resources. Ordinance #2017-302 will allow industry into Jefferson County that risks harming these elements and dramatically reducing the area's appeal to visitors. The resulting harm to our tourist industry would drive away visitors and decrease state, county, and local revenue. The long-term success of Jefferson County's tourism industry is dependent on local governments making coordinated zoning decisions. Allowing certain types in industry in Ranson will negatively affect tourism in every municipality throughout the county, including Shepherdstown. Voting no on ordinance #2017-302 will protect the foundations of the county's tourism industry and protect the 7,040 jobs in Jefferson County that are directly supported by tourism.

The type of large, consolidated industry that ordinance #2017-302 would allow in Ranson would generally reduce the flexibility of local economies in Jefferson County. Historically, the driving industries in Jefferson County have been tourism, agriculture, and the equine industries. These three industries are large conglomerates of small businesses. Small business is very important to Sheherdstown. Small businesses have been shown to create more jobs, cultivate more innovation, and provide more opportunities than big, non-local firms. Additionally, small businesses have been shown to more reactive to sudden changes relative to manufacturing

businesses. Bringing large, manufacturing-based industry into Jefferson county will depress the local economy and stifle innovation. During this time of economic upheaval and uncertainty, Jefferson County needs to support industries that will allow local economies to adapt and recover as fast as possible.

Voting no on ordinance #2017-302 will help protect water resources throughout Jefferson County. The type of industry that ordinance #2017-302 would allow puts the ground resources of Jefferson county at significant risk due to the karst hydrogeology. The site in Ranson is in the Rocky Marsh Run watershed, which is in the source water protection zone for Shepherdstown and drains to the Potomac River. Therefore, activity at this site will affect both groundwater and surface water streams. In municipalities like Shepherdstown, many residents and nearby farms depend on wells for water. Contamination of groundwater aquifers would create both health and remediation concerns for local residents. Dye tests performed by the USGS near the area of proposed rezoning in Ranson have shown just how far-reaching groundwater contamination at the Ranson site could be. Results from the USGS study revealed measurable dye concentrations in Elk's Run, Rattlesnake Run, and even the Shepherdstown Town Run. This last run cuts through the center of Shepherdstown and is a favorite area for children to play and learn to fish.

Groundwater pollution is not the only concern for communities like Shepherdstown. The type of industry that ordinance #2017-302 would allow in Ranson would also generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. These pollutants are particularly harmful to children. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. The site in Ranson is across the road from an elementary school and also within the Jefferson High Middle district. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of children in Shepherdstown and all of Jefferson County.

I again request that you vote no on ordinance #2017-302. The long-term economic, environmental, and community health of municipalities like Shepherdstown depend on Ranson's participation in a coordinated zoning plan for all of Jefferson County.

Sincerely,

Emily Gross

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on Ordinance #2017-302. Ranson's proposed zoning change presents a significant risk to the equine industry in Jefferson County and well beyond. The type of industry that would be allowed by the proposed zoning change in this location would jeopardize horse health, the groundwater supply, and workforce productivity. This will cause immediate shrinkage and threaten the long-term viability of the equine industry in the county.

The site of the proposed rezoning is less than six miles from Charles Town Races, with several breeding, training, and rehabilitation facilities between the two. The industry allowed by this rezoning would produce particulate, gaseous, and hazardous air emissions that would reach these sites. According to the WVDEP air permit, the Rockwool plant in Ranson is permitted to emit 250.87 tons of particulate matter per year into the air (1).

According to a recent study published in the journal of Veterinary Internal Medicine (2), horses are 15 times more sensitive to inhaled particulate matter than humans. Inhaled particulate matter can cause inflammation in horses' lungs that negatively affects performance. Inhaled particulate matter also contributes to the development of inflammatory airway disease (IAD) (3). IAD is a chronic airway disease that can affect horses long after their racing career is over. While there is little research on how other air pollutants affect horses, the effects of pollution on humans can be used to infer potential impact on horses. However unlike human models, these horses are elite athletes continuously exposed, and will thus likely experience detrimental effects at much lower levels of air pollution than humans.

The primary concern with air pollution is that increased levels of pollutants will increase inflammation in horses' lungs. Even small, subclinical amounts of inflammation in the lungs of horses negatively affect performance (2,3,4,5,6,11). This inflammation can also cause increased recovery times following racing (7,11). Reduced performance and training interruptions can lead to higher risk of injury, reduced winning average, fewer yearly starts, lower yearly

earnings, shortened career length, fewer lifetime starts, reduced lifetime earnings, and reduced quality of life (2,3,8,9,11). Each of these situations will lead to decreased return on investment, decreased cash flow, and decreased overall earnings for owners, trainers, and breeders with horses at Charles Town Races and in nearby areas.

While racing is usually a thoroughbred's first career, it is rarely their last. Some racing horses go on to be breeding stock, while others will have successful careers as sport horses. Jefferson County is an important source of new stock for sport horse trainers from Northern Virginia, and Maryland, and this is a resource for local horseman of both income and placement for horses not appropriate for breeding. However, if retired racehorses are unsound from injury or respiratory disease, they can be difficult to manage as breeding stock or unfit for a career as a sport horse. This affects the horse's quality of life and also places a burden on the industry locally and regionally.

The perception of decreased air quality from the increase in regional haze and visible smokestacks as one drives into the county will deter out of state owners and breeders from investing in West Virginia bred Race horses, decreasing or eliminating a critical \$50 million a year source of local business volume.

Another concern related to the proposed rezoning in Ranson is the risk of groundwater contamination as a result of the karst hydrogeology at the site and the industrial activity. Horsemen will either have to take on the expense of periodically testing water sources or they may not know local ground water is contaminated until their animals are sick. Veterinary care and testing adds expense and uncertainty to an industry that already deals with large inherent risks. The actual occurrence of ground water contamination would be devastating for Jefferson County's equine industry. For both geographic and financial reasons, it is simply impossible to think that the industry could solely use public or private utility-provided water if industrial activity fouled the local groundwater.

Finally, studies on US agricultural workers have demonstrated that increased air pollution decreases productivity of outdoors workers. This would place an additional burden on workers, small business owners and the industry.

The equine industry in Jefferson County is hundreds of years old. It is not worth risking this historic and economically valuable industry by rezoning for industrial companies like Rockwool. An economic impact study of the Charles Town Thoroughbred Horse Racing Industry on Jefferson County's economy found that the spending by owners, breeders, and trainers of the equine industry directly contributes \$79.4 million to the county each year. Out-of-state owners, breeders, and trainers spend more than \$50 million in Jefferson County every year. The value of total business volume in Jefferson County is \$191 million each year (10). These numbers do not include the effect of the handle or the casino.

The equine industry provides jobs for a broad cross-section of the public. This industry offers individuals of any educational background a variety of paths to achieve a good middle-income

living. Many jobs allow individuals to pursue apprenticeships or on-the-job training rather than requiring a costly college education. This flexibility allows for greater lifetime earnings and improved educational debt-to-earnings ratio for these workers. The equine industry also provides opportunities for non-traditional workers by offering job opportunities to those who may not be employable by larger corporations. This industry provides a variety of full-time, part-time, flexible, and pick-up work. Encouraging this type of flexible job ecosystem helps create a healthy economy with broad participation in employment and consumption.

The equine industry is a large conglomerate of small businesses, which have a multitude of economic benefits over having a few large businesses. It has been extensively reported that small locally owned businesses and start ups create more jobs, cultivate innovation, generate higher incomes, and provide more opportunities for individuals that would otherwise not exist than big non-local firms, which can actually depress local economies. The equine industry provides opportunities for small businesses and startups responsible for this growth of better jobs that are so good for the economy.

The equine industry offers so many other benefits that the industry in the rezoned area would not. For example, the equine industry supports local agriculture by providing a market for agricultural goods such as straw. The robust straw market supported by owners, trainers, and breeders allows for a third cash crop to be produced from one field in a year. Through pastureland and support of local agricultural goods, the equine industry protects and preserves the open spaces that give our county its bucolic quality and help attract tourists. Through the breeders' incentive programs, the equine industry offers unique opportunities to draft state funds back to Jefferson County, to name a few.

Rezoning this area of Ranson for Special District Industrial will allow in entities whose activities are harmful to the equine industry. The losses incurred by the equine industry would far outweigh any benefits derived from industries occupying the rezoned area. Sacrificing the long-term viability of one of our oldest and most productive industries for a net loss in business volume and economic value just does not make good sense for the local economy. Please vote NO on Ordinance #2017-302.

Sincerely,

Diann Landau

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on #2017-302. The air emissions, possibility of ground and surface water contamination, and their effect on our interwoven economies threaten the health, safety and welfare of not just Jefferson County but the greater region, including Loudoun and the greater Northern Virginia area.

This zoning would provide for industry that produces large amounts of air emissions. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. Northern Virginia is directly downwind from these emissions. Much of the gaseous, fine particulate, and hazardous emissions can reach Northern Virginia. Further affecting the outdoor air quality of the adjacent portion of Virginia and the ability of these areas to achieve and maintain National Ambient Air Quality Standards (NAAQS) attainment. This will affect agriculture and outdoor leisure and recreation.

For example, Loudoun County has been in nonattainment for the NAAQS 8-hour Ozone standard for the past two years. VOC and NO_x react after they have been emitted to produce ground level ozone. The industry that this rezoning would provide for would produce large amounts of these emissions. This would make it even harder as Loudoun County tries to achieve attainment. As time goes on and the scientific research advances our knowledge and understanding of the extent to which gaseous, particulate and hazardous emissions affect human health the NAAQS standards are likely to be reduced. The effects on air emission from this rezoning will make it only harder for Loudoun and Northern Virginia to meet these standards.

In addition to the concerns about the air, the possible ground and surface water contamination is very concerning to Loudoun and Virginia residents. The site is known to have ground water that is vulnerable to contamination due to the karst hydrogeology. A USGS study demonstrated that the ground water adjacent to the site to be rezoned communicates readily with surface

water tributaries of the Potomac River. In addition to direct infiltration where water moves directly from the surface to groundwater via porous limestone bedrock, karst is known to have severe ground instability problems. This makes karst geology prone to sinkhole development. Sinkholes provide direct connection between the surface water and any contaminants it may contain and the groundwater. This makes the aquifer vulnerability in karst areas very high, and contamination with industrial activity such as that provided for by this rezoning too likely.

Loudoun sources its drinking water from the Potomac River, downstream of many West Virginia tributaries that carry water from the epikarst and groundwater aquifer at the site to be rezoned. Loudoun has recently completed the new Trap Rock Water Treatment facility, which draws water from the Potomac River. Loudoun currently provides 40 million gallons and projects to provide 90 million gallons of drinking water a day to customers by 2040 (Loudounwater.org). Therefore, the viability of the Potomac River is a high priority for Virginia residents.

Loudoun and Northern Virginia is one of the fastest growing communities in the country and provides a lot to Jefferson County in their symbiotic relationship. Virginia residents support and enjoy Jefferson County through tourism, as our residents enjoy the natural and historical resources of your county. Virginia residents and businesses support the equine industry in a multitude of ways from providing wagering fans at the races to the Virginia Breeders Association Virginia Certified incentive programs and a strong market for retired racehorses. According to an economic impact study from WVU, at least 40% of Jefferson County residents travel outside of West Virginia for work, a good percentage of those travel to northern Virginia. This rezoning would allow for industry that would negatively affect the economy of both places and this relationship and the benefits for our residents gleaned from it.

This zoning change will provide for industry that will negatively effect the health safety and welfare of the Loudon and Northern Virginia community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Teresa Hayes

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask that you vote no on Ordinance #2017-302. While not in Ranson, the land and homes around the property that is the subject of the zoning change are closer to the property than anyone who currently lives within the city limits of Ranson. This area will be affected sooner and more harshly by the environmental issues that will develop secondary to the inappropriate siting of industry this zoning would allow.

The subject land has been well studied by Drs. Kozar, Doctor and Doctor and described in the scientific literature and USGS reports as having karst hydrology with very high aquifer vulnerability. The karst landscape is a consequence of the presence of soluble bedrock, which consists of limestone in the case of the subject land. In such landscapes water percolates through the ground and dissolves the underlying rock creating a porous network of caverns and throughways. Karst aquifers are known to be "extremely vulnerable to pollution" due to direct connection between the surface water and groundwater through both point (sinkholes) and diffuse (everywhere) infiltration. It is known from the Voluntary Remediation Plan of Jefferson Orchard that the groundwater at the subject site is only 60 feet below the ground. The subject property and much of the property around it are on an upland plain with few surface streams, but great seasonal variability in the water table resulting in numerous esteves and large amounts of water in the epikarst. This water is easily contaminated and this contamination spreads quickly throughout the aquifer. Dye tests performed near the subject site by the USGS have demonstrated this quick moving thorough dispersment in the aquifer in this area. While this contamination goes on to affect springs at the margins of the upland area continuing on in streams that service municipal water sources and the Potomac River, our concerns are far more immediate in both time and distance. Well water is the only water source available in the area of the proposed zoning change and, with the exception of Fox Glen, a majority of this water is supplied by private wells. Therefore, the groundwater aquifer fulfills a critical necessity, fulfilling all needs including human consumption, household uses, and agriculture and

maintenance of livestock and horses in the immediate area around the site. The concern is that if the aquifer becomes contaminated, then the local drinking water will be fouled.

For decades now, policy makers have been using “Aquifer Vulnerability,” to set land use and water resource protection policy. Karst has very high Aquifer Vulnerability. Therefore, this industrial use is not appropriate for this land and it should not be zoned for it. The guiding documents of the WVDEP recognize this. The introduction to the WVDEP document *Stormwater Management Design in Karst Areas* states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.”

The Chesapeake Bay Stormwater Network karst stormwater guidance document the *CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed*, which the WVDEP cites in its own guiding document *Stormwater Management Design in Karst Areas*, clearly agrees stating

“First, the effect of land development on karst terrain is complex and hard to predict, and requires professional analysis to reduce the risk of geological hazards, damage to infrastructure and groundwater contamination.”

“The working group acknowledges that past approaches to stormwater and land development in karst terrain have been inadequate to safeguard the public and the environment.”

“...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.”

We clearly need stronger comprehensive land use plans and zoning that direct new growth away from karst areas to more appropriate locations. Ordinance #2017-302 is literally the opposite of this.

Further, we cannot rely on the WVDEP to do the job that good local land use guidelines and zoning should do. For example, the *CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed* states that detention and retention ponds are not recommended on karst and categorize them as discouraged. Also, quoting WVDEP’s own karst guidance: “attenuating surface runoff will increase the rate of sinkhole formation and potential groundwater contamination.” Yet the entity currently planning to utilize this zoning change is planning employment of multiple massive retention ponds and attenuating surface runoff completely. This has already been approved by the DEP in two Construction Stormwater General Permit registrations for that company. One of detention ponds is not even regulated by the DEP as it contains process water and has no outlet. Clearly the DEP recognizes the risks but is not appropriately limiting them. Relying on the DEP to protect the public health, safety, welfare, and the environment from any entity in these karst locations is simply as the CNS bulletin said it “inadequate to safeguard the public and the environment.” We must have appropriate zoning that takes into consideration appropriate use of land with karst

hydrogeology. Ordinance #2017-302 does not do this, but instead increases the risk to the public and the environment.

A second serious concern is the air emissions from the industry that this zoning will provide for. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. These types of air emissions have been shown to increase the risk of, contribute to, and exacerbate a multitude of developmental, physical, physiological, physiological, cognitive and economic. The exposure of one individual can cause repercussions in multiple generations. Embryos, fetuses, and children are most vulnerable with effects born out over a lifetime, and that of their offspring. Many of these effects only require short-term exposure and some have even been shown to occur at levels below current limits recommended by the World Health Organization. One example of this is that a recent study found that “Even within the limits set by the World Health Organization, the pollutants PM10, SO₂, NO₂, and O₃ are associated with increased risk of treatment for respiratory diseases in children 0 to 6 years of age.” Unfortunately, the US limits are higher than WHO, 300 % higher in the case of PM10!

In fact, in 2019, in the Advice from the Independent Particulate Matter Review Panel (formerly U.S. EPA Clean Air Scientific Advisory Committee Particulate Matter Review Panel) on EPA’s Policy Assessment for the Review of the National Ambient Air Quality Standards for Particulate Matter, it stated that the committee unanimously and unequivocally found that the current primary annual and 24-hour PM_{2.5} National Ambient Air Quality Standards (NAAQS) are not adequate to protect public health. The advice from this 20-member committee, whose scientific disciplines include epidemiology, medicine, toxicology, air quality measurement, air quality modeling, exposure assessment measurement and modeling, risk assessment, statistics, and others, was ignored due presumably to political pressure. Not only are the NAAQS too high in some cases, but due to the measure and mechanism by which they work, they can not replace the safety provided by good land use and zoning regulations, that are meant to do things like keep factories with air emissions and hundreds of heavy trucks away from elementary schools. In fact, there is a state law that prohibits siting a school near a factory. Unfortunately, the reciprocal law does not exist. Clearly, just like with the water resources, we cannot rely on the DEP or the EPA to do the job of what appropriate zoning should do. The whole point of zoning is to keep people safe and provide for their health and welfare. Ordinance #2017-302 puts families and school children directly in harms way.

The air emissions, threat to the groundwater, and the very presence of the industry that this zoning change will allow for will have a serious negative economic effect on those who live and or work closest to the site in question. Productivity and workforce participation will be negatively affected by the health effects of the air emissions. The local agricultural operations will be negatively affected by the air emissions with lower quantity and quality of crop yield and would be devastated if the ground water aquifer were fouled. The equine operations in the area, of which there are several, will be negatively affected by the air emissions as they affect the horses’ health and performance. The mere presence of the industry that will be provided

for by this zoning change will cause property values to fall. There will be serious economic consequences for the immediate area around the site in question.

Several of the communities in the immediate area of the site for proposed zoning change are traditionally underserved and have lower economic status. The choice of this location for such a zoning change represents an egregious example of environmental injustice that should not be promulgated or tolerated.

This zoning change will provide for industry that will negatively affect the health safety and welfare of our community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Karen Freer

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on #2017-302. The air emissions, possibility of ground and surface water contamination, and their effect on our interwoven economies threaten the health, safety and welfare of not just Jefferson County but the greater region, including Loudoun and the greater Northern Virginia area.

This zoning would provide for industry that produces large amounts of air emissions. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. Northern Virginia is directly downwind from these emissions. Much of the gaseous, fine particulate, and hazardous emissions can reach Northern Virginia. Further affecting the outdoor air quality of the adjacent portion of Virginia and the ability of these areas to achieve and maintain National Ambient Air Quality Standards (NAAQS) attainment. This will affect agriculture and outdoor leisure and recreation.

For example, Loudoun County has been in nonattainment for the NAAQS 8-hour Ozone standard for the past two years. VOC and NO_x react after they have been emitted to produce ground level ozone. The industry that this rezoning would provide for would produce large amounts of these emissions. This would make it even harder as Loudoun County tries to achieve attainment. As time goes on and the scientific research advances our knowledge and understanding of the extent to which gaseous, particulate and hazardous emissions affect human health the NAAQS standards are likely to be reduced. The effects on air emission from this rezoning will make it only harder for Loudoun and Northern Virginia to meet these standards.

In addition to the concerns about the air, the possible ground and surface water contamination is very concerning to Loudoun and Virginia residents. The site is known to have ground water that is vulnerable to contamination due to the karst hydrogeology. A USGS study demonstrated that the ground water adjacent to the site to be rezoned communicates readily with surface

water tributaries of the Potomac River. In addition to direct infiltration where water moves directly from the surface to groundwater via porous limestone bedrock, karst is known to have severe ground instability problems. This makes karst geology prone to sinkhole development. Sinkholes provide direct connection between the surface water and any contaminants it may contain and the groundwater. This makes the aquifer vulnerability in karst areas very high, and contamination with industrial activity such as that provided for by this rezoning too likely.

Loudoun sources its drinking water from the Potomac River, downstream of many West Virginia tributaries that carry water from the epikarst and groundwater aquifer at the site to be rezoned. Loudoun has recently completed the new Trap Rock Water Treatment facility, which draws water from the Potomac River. Loudoun currently provides 40 million gallons and projects to provide 90 million gallons of drinking water a day to customers by 2040 (Loudounwater.org). Therefore, the viability of the Potomac River is a high priority for Virginia residents.

Loudoun and Northern Virginia is one of the fastest growing communities in the country and provides a lot to Jefferson County in their symbiotic relationship. Virginia residents support and enjoy Jefferson County through tourism, as our residents enjoy the natural and historical resources of your county. Virginia residents and businesses support the equine industry in a multitude of ways from providing wagering fans at the races to the Virginia Breeders Association Virginia Certified incentive programs and a strong market for retired racehorses. According to an economic impact study from WVU, at least 40% of Jefferson County residents travel outside of West Virginia for work, a good percentage of those travel to northern Virginia. This rezoning would allow for industry that would negatively affect the economy of both places and this relationship and the benefits for our residents gleaned from it.

This zoning change will provide for industry that will negatively effect the health safety and welfare of the Loudon and Northern Virginia community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Jonathan Zapien

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would negatively affect tourism, economic agility, groundwater quality, and individual health in neighboring municipalities like Shepherdstown.

Tourism is critically important to Shepherdstown's economy and to the county as a whole. In 2018, tourist spending in the Jefferson County contributed over \$170 million to state and local government revenue and \$213 million in individual earnings. Importantly, most of this money comes from tourists visiting from neighboring states like Virginia, Maryland, and Washington D.C. Out-of-state tourists are largely drawn to Jefferson County because of its reputation for environmental-friendly, sustainable industry. Key elements that support this reputation include the county's pastoral scenery and pristine natural resources. Ordinance #2017-302 will allow industry into Jefferson County that risks harming these elements and dramatically reducing the area's appeal to visitors. The resulting harm to our tourist industry would drive away visitors and decrease state, county, and local revenue. The long-term success of Jefferson County's tourism industry is dependent on local governments making coordinated zoning decisions. Allowing certain types in industry in Ranson will negatively affect tourism in every municipality throughout the county, including Shepherdstown. Voting no on ordinance #2017-302 will protect the foundations of the county's tourism industry and protect the 7,040 jobs in Jefferson County that are directly supported by tourism.

The type of large, consolidated industry that ordinance #2017-302 would allow in Ranson would generally reduce the flexibility of local economies in Jefferson County. Historically, the driving industries in Jefferson County have been tourism, agriculture, and the equine industries. These three industries are large conglomerates of small businesses. Small business is very important to Sheherdstown. Small businesses have been shown to create more jobs, cultivate more innovation, and provide more opportunities than big, non-local firms. Additionally, small businesses have been shown to more reactive to sudden changes relative to manufacturing

businesses. Bringing large, manufacturing-based industry into Jefferson county will depress the local economy and stifle innovation. During this time of economic upheaval and uncertainty, Jefferson County needs to support industries that will allow local economies to adapt and recover as fast as possible.

Voting no on ordinance #2017-302 will help protect water resources throughout Jefferson County. The type of industry that ordinance #2017-302 would allow puts the ground resources of Jefferson county at significant risk due to the karst hydrogeology. The site in Ranson is in the Rocky Marsh Run watershed, which is in the source water protection zone for Shepherdstown and drains to the Potomac River. Therefore, activity at this site will affect both groundwater and surface water streams. In municipalities like Shepherdstown, many residents and nearby farms depend on wells for water. Contamination of groundwater aquifers would create both health and remediation concerns for local residents. Dye tests performed by the USGS near the area of proposed rezoning in Ranson have shown just how far-reaching groundwater contamination at the Ranson site could be. Results from the USGS study revealed measurable dye concentrations in Elk's Run, Rattlesnake Run, and even the Shepherdstown Town Run. This last run cuts through the center of Shepherdstown and is a favorite area for children to play and learn to fish.

Groundwater pollution is not the only concern for communities like Shepherdstown. The type of industry that ordinance #2017-302 would allow in Ranson would also generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. These pollutants are particularly harmful to children. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. The site in Ranson is across the road from an elementary school and also within the Jefferson High Middle district. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of children in Shepherdstown and all of Jefferson County.

I again request that you vote no on ordinance #2017-302. The long-term economic, environmental, and community health of municipalities like Shepherdstown depend on Ranson's participation in a coordinated zoning plan for all of Jefferson County.

Thank you for your time and please vote no.

Sincerely,

Gabrielle Tokach

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask you to vote NO on Ordinance #2017-302. The industry this zoning change will allow for endangers the health, safety and, welfare of the community, and violates the premise of the smart code zoning that we have spent so much time, effort and federal money employing.

Any change in zoning needs to align with the comprehensive plan. In Ranson's current comprehensive plan (2012), the City only refers to "heavy industry" in the history section. Here it is characterized as part of a bygone era that has been replaced by an emphasis on agriculture for local food production, open spaces, and quality-of-life. In the remainder of the document, the word industry is used loosely to describe businesses including flower shops and shoe stores. Nothing that resembles the industry that this zoning change will provide for is described in the current comprehensive plan of Ranson.

In the land use section of the comprehensive plan, number ten states:

"Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The comprehensive plan clearly states that the city will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community. This change in zoning clearly negatively affects the health, safety, and welfare of the community.

As the zoning is proposed, the industry that this zoning change will allow for will be directly across the street from houses, parks and other small businesses. A densely populated subdivision and an elementary school already exit directly across the street. While these latter

community sections are not in the city limits, the effect of this zoning on them should still be considered just the same as it would be if they were in the city limits.

The industry that this zoning change will provide for will produce particulate, gaseous, and hazardous air emissions. These emissions have been shown to be detrimental to human health at every stage of life from embryo to old age. In utero and childhood exposure are the most damaging with lasting effects being realized through out life, and with maternal exposure the effects can be felt for generations. Multiple organ systems are affected including respiratory, cardiovascular, neurologic, immune, and endocrine causing defects in multiple processes including in utero development, neurodevelopment, immune and tolerance development, and cognitive defects. There are also psychological, social, and economic effects from both perceived and actual air pollution in both children and adults. Many of these effects can be seen even with short-term exposure or exposure that is lower than the levels recommended by the US Environmental Protection Agency and World Health Organization. These consequences are devastating to the individual and depressing to the local community and economy. State law does not allow a school to be built next to industry that this zoning will allow but yet we are contemplating changing the zoning so this industry can build next to a school. This does not make sense. As Ranson residents, we want Ranson to follow the lead of the state and keep polluting industry away from kids. In these ways, this change in zoning will negatively affect the health and welfare of the community.

In addition to the health effects of the air emissions is the threat to groundwater from the industry that this zoning change would allow. The land in question has karst hydrogeology and therefore very high aquifer vulnerability and is not appropriate for this industry. With the type of industry this zoning will provide for, combined with high aquifer vulnerability, the likelihood of groundwater contamination is too high for the community and region to bear. A USGS study demonstrated that contamination in the groundwater adjacent to the site moves relatively quickly and can be found in wells and surface water structures in a variety of locations in the County. In this way, contamination at the site would affect the drinking water of the great majority of Jefferson County residents. Through the surface water connections, the water at the site also affects the water resources of the region.

Aquifer vulnerability has been used by policy makers for decades to set land use regulations. The guiding document, from the WVDEP, *Stormwater Management Design in Karst Areas* states, "it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." In Ranson, we need to follow this advice and not change the zoning of this land for use by industry that has among the highest aquifer vulnerability in the County. This zoning change will endanger the safety of the community and region by endangering the safe water resources. As Ranson residents, we want to safeguard the water resources of the county and region by following the WVDEP guidance here.

Further, by reallocating this transect district and replacing it with a monolithic block of Special District Industrial designation, hundreds of housing units, parks and space for small businesses are lost. Ranson loses the potential for property tax on these properties and their improvements, Business and Occupational tax on the businesses and sales tax in retail stores. The community loses out on the opportunity to develop affordable housing and create locations where people can live, work, play, and shop all in the same place reducing the need for travel.

Worse yet apparently a deal has been made where the entity that owns the subject land has required that a litany of things not be built on the adjacent land essentially stripping the purpose of the smart code transect zone that exists there. Transect zones in the smart code are meant to transition, from out to in, and provide communities where people can safely work and live in close proximity in an effort to reduce travel. Excluding many of the components of the transect zone effectively eliminates the features that make it a transect zone, thus, losing the benefits a transect zone offers the community and city. By losing these benefits, reducing the overall and affordable housing prospects, and reducing so drastically the opportunities for city income, this zoning change will negatively affect the welfare of the community.

As Ranson residents, we find it odd that we are changing zoning to provide for industry that we would not put in the middle of our town close to our residents, but we are placing it close to the homes of county residents. Further, it is striking that the area where this change in zoning is directly adjacent to historically underserved lower income communities and a Title I school. This amounts to environmental injustice and cannot be tolerated.

The purpose of zoning is for a city to protect the health, welfare, morals and safety of the community. In this case, the air emissions and heavy truck traffic will endanger the communities' health. The threat of water contamination will endanger the safety of the community. The effect of lost productivity and decreased workforce participation due to increased illness and the negative effect the air emissions and presence of such a factory will have on the local economy will negatively affect the welfare of the community. The environmental injustice of changing the zoning to accommodate such polluting industry in a location where your municipality has no residents, but yet hundreds of low income and underserved county residents live is egregiously amoral. This must not happen. We respectfully implore you to do the right thing and vote no on ordinance #2017-302.

Sincerely,

Karen Freer

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

I am a horse owner and rider.

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on Ordinance #2017-302. Ranson's proposed zoning change presents a significant risk to the equine industry in Jefferson County and well beyond. The type of industry that would be allowed by the proposed zoning change in this location would jeopardize horse health, the groundwater supply, and workforce productivity. This will cause immediate shrinkage and threaten the long-term viability of the equine industry in the county.

The site of the proposed rezoning is less than six miles from Charles Town Races, with several breeding, training, and rehabilitation facilities between the two. The industry allowed by this rezoning would produce particulate, gaseous, and hazardous air emissions that would reach these sites. According to the WVDEP air permit, the Rockwool plant in Ranson is permitted to emit 250.87 tons of particulate matter per year into the air (1).

According to a recent study published in the journal of Veterinary Internal Medicine (2), horses are 15 times more sensitive to inhaled particulate matter than humans. Inhaled particulate matter can cause inflammation in horses' lungs that negatively affects performance. Inhaled particulate matter also contributes to the development of inflammatory airway disease (IAD) (3). IAD is a chronic airway disease that can affect horses long after their racing career is over. While there is little research on how other air pollutants affect horses, the effects of pollution on humans can be used to infer potential impact on horses. However unlike human models, these horses are elite athletes continuously exposed, and will thus likely experience detrimental effects at much lower levels of air pollution than humans.

The primary concern with air pollution is that increased levels of pollutants will increase inflammation in horses' lungs. Even small, subclinical amounts of inflammation in the lungs of horses negatively affect performance (2,3,4,5,6,11). This inflammation can also cause increased recovery times following racing (7,11). Reduced performance and training interruptions can

lead to higher risk of injury, reduced winning average, fewer yearly starts, lower yearly earnings, shortened career length, fewer lifetime starts, reduced lifetime earnings, and reduced quality of life (2,3,8,9,11). Each of these situations will lead to decreased return on investment, decreased cash flow, and decreased overall earnings for owners, trainers, and breeders with horses at Charles Town Races and in nearby areas.

While racing is usually a thoroughbred's first career, it is rarely their last. Some racing horses go on to be breeding stock, while others will have successful careers as sport horses. Jefferson County is an important source of new stock for sport horse trainers from Northern Virginia, and Maryland, and this is a resource for local horseman of both income and placement for horses not appropriate for breeding. However, if retired racehorses are unsound from injury or respiratory disease, they can be difficult to manage as breeding stock or unfit for a career as a sport horse. This affects the horse's quality of life and also places a burden on the industry locally and regionally.

The perception of decreased air quality from the increase in regional haze and visible smokestacks as one drives into the county will deter out of state owners and breeders from investing in West Virginia bred Race horses, decreasing or eliminating a critical \$50 million a year source of local business volume.

Another concern related to the proposed rezoning in Ranson is the risk of groundwater contamination as a result of the karst hydrogeology at the site and the industrial activity. Horsemen will either have to take on the expense of periodically testing water sources or they may not know local ground water is contaminated until their animals are sick. Veterinary care and testing adds expense and uncertainty to an industry that already deals with large inherent risks. The actual occurrence of ground water contamination would be devastating for Jefferson County's equine industry. For both geographic and financial reasons, it is simply impossible to think that the industry could solely use public or private utility-provided water if industrial activity fouled the local groundwater.

Finally, studies on US agricultural workers have demonstrated that increased air pollution decreases productivity of outdoors workers. This would place an additional burden on workers, small business owners and the industry.

The equine industry in Jefferson County is hundreds of years old. It is not worth risking this historic and economically valuable industry by rezoning for industrial companies like Rockwool. An economic impact study of the Charles Town Thoroughbred Horse Racing Industry on Jefferson County's economy found that the spending by owners, breeders, and trainers of the equine industry directly contributes \$79.4 million to the county each year. Out-of-state owners, breeders, and trainers spend more than \$50 million in Jefferson County every year. The value of total business volume in Jefferson County is \$191 million each year (10). These numbers do not include the effect of the handle or the casino.

The equine industry provides jobs for a broad cross-section of the public. This industry offers individuals of any educational background a variety of paths to achieve a good middle-income living. Many jobs allow individuals to pursue apprenticeships or on-the-job training rather than requiring a costly college education. This flexibility allows for greater lifetime earnings and improved educational debt-to-earnings ratio for these workers. The equine industry also provides opportunities for non-traditional workers by offering job opportunities to those who may not be employable by larger corporations. This industry provides a variety of full-time, part-time, flexible, and pick-up work. Encouraging this type of flexible job ecosystem helps create a healthy economy with broad participation in employment and consumption.

The equine industry is a large conglomerate of small businesses, which have a multitude of economic benefits over having a few large businesses. It has been extensively reported that small locally owned businesses and start ups create more jobs, cultivate innovation, generate higher incomes, and provide more opportunities for individuals that would otherwise not exist than big non-local firms, which can actually depress local economies. The equine industry provides opportunities for small businesses and startups responsible for this growth of better jobs that are so good for the economy.

The equine industry offers so many other benefits that the industry in the rezoned area would not. For example, the equine industry supports local agriculture by providing a market for agricultural goods such as straw. The robust straw market supported by owners, trainers, and breeders allows for a third cash crop to be produced from one field in a year. Through pastureland and support of local agricultural goods, the equine industry protects and preserves the open spaces that give our county its bucolic quality and help attract tourists. Through the breeders' incentive programs, the equine industry offers unique opportunities to draft state funds back to Jefferson County, to name a few.

Rezoning this area of Ranson for Special District Industrial will allow in entities whose activities are harmful to the equine industry. The losses incurred by the equine industry would far outweigh any benefits derived from industries occupying the rezoned area. Sacrificing the long-term viability of one of our oldest and most productive industries for a net loss in business volume and economic value just does not make good sense for the local economy. Please vote NO on Ordinance #2017-302.

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on #2017-302. The air emissions, possibility of ground and surface water contamination, and their effect on our interwoven economies threaten the health, safety and welfare of not just Jefferson County but the greater region, including Loudoun and the greater Northern Virginia area.

This zoning would provide for industry that produces large amounts of air emissions. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. Northern Virginia is directly downwind from these emissions. Much of the gaseous, fine particulate, and hazardous emissions can reach Northern Virginia. Further affecting the outdoor air quality of the adjacent portion of Virginia and the ability of these areas to achieve and maintain National Ambient Air Quality Standards (NAAQS) attainment. This will affect agriculture and outdoor leisure and recreation.

For example, Loudoun County has been in nonattainment for the NAAQS 8-hour Ozone standard for the past two years. VOC and NO_x react after they have been emitted to produce ground level ozone. The industry that this rezoning would provide for would produce large amounts of these emissions. This would make it even harder as Loudoun County tries to achieve attainment. As time goes on and the scientific research advances our knowledge and understanding of the extent to which gaseous, particulate and hazardous emissions affect human health the NAAQS standards are likely to be reduced. The effects on air emission from this rezoning will make it only harder for Loudoun and Northern Virginia to meet these standards.

In addition to the concerns about the air, the possible ground and surface water contamination is very concerning to Loudoun and Virginia residents. The site is known to have ground water that is vulnerable to contamination due to the karst hydrogeology. A USGS study demonstrated that the ground water adjacent to the site to be rezoned communicates readily with surface

water tributaries of the Potomac River. In addition to direct infiltration where water moves directly from the surface to groundwater via porous limestone bedrock, karst is known to have severe ground instability problems. This makes karst geology prone to sinkhole development. Sinkholes provide direct connection between the surface water and any contaminants it may contain and the groundwater. This makes the aquifer vulnerability in karst areas very high, and contamination with industrial activity such as that provided for by this rezoning too likely.

Loudoun sources its drinking water from the Potomac River, downstream of many West Virginia tributaries that carry water from the epikarst and groundwater aquifer at the site to be rezoned. Loudoun has recently completed the new Trap Rock Water Treatment facility, which draws water from the Potomac River. Loudoun currently provides 40 million gallons and projects to provide 90 million gallons of drinking water a day to customers by 2040 (Loudounwater.org). Therefore, the viability of the Potomac River is a high priority for Virginia residents.

Loudoun and Northern Virginia is one of the fastest growing communities in the country and provides a lot to Jefferson County in their symbiotic relationship. Virginia residents support and enjoy Jefferson County through tourism, as our residents enjoy the natural and historical resources of your county. Virginia residents and businesses support the equine industry in a multitude of ways from providing wagering fans at the races to the Virginia Breeders Association Virginia Certified incentive programs and a strong market for retired racehorses. According to an economic impact study from WVU, at least 40% of Jefferson County residents travel outside of West Virginia for work, a good percentage of those travel to northern Virginia. This rezoning would allow for industry that would negatively affect the economy of both places and this relationship and the benefits for our residents gleaned from it.

This zoning change will provide for industry that will negatively effect the health safety and welfare of the Loudon and Northern Virginia community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Laura Graeber

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would negatively affect tourism, economic agility, groundwater quality, and individual health in neighboring municipalities like Shepherdstown.

Tourism is critically important to Shepherdstown's economy and to the county as a whole. In 2018, tourist spending in the Jefferson County contributed over \$170 million to state and local government revenue and \$213 million in individual earnings. Importantly, most of this money comes from tourists visiting from neighboring states like Virginia, Maryland, and Washington D.C. Out-of-state tourists are largely drawn to Jefferson County because of its reputation for environmental-friendly, sustainable industry. Key elements that support this reputation include the county's pastoral scenery and pristine natural resources. Ordinance #2017-302 will allow industry into Jefferson County that risks harming these elements and dramatically reducing the area's appeal to visitors. The resulting harm to our tourist industry would drive away visitors and decrease state, county, and local revenue. The long-term success of Jefferson County's tourism industry is dependent on local governments making coordinated zoning decisions. Allowing certain types in industry in Ranson will negatively affect tourism in every municipality throughout the county, including Shepherdstown. Voting no on ordinance #2017-302 will protect the foundations of the county's tourism industry and protect the 7,040 jobs in Jefferson County that are directly supported by tourism.

The type of large, consolidated industry that ordinance #2017-302 would allow in Ranson would generally reduce the flexibility of local economies in Jefferson County. Historically, the driving industries in Jefferson County have been tourism, agriculture, and the equine industries. These three industries are large conglomerates of small businesses. Small business is very important to Sheherdstown. Small businesses have been shown to create more jobs, cultivate more innovation, and provide more opportunities than big, non-local firms. Additionally, small businesses have been shown to more reactive to sudden changes relative to manufacturing

businesses. Bringing large, manufacturing-based industry into Jefferson county will depress the local economy and stifle innovation. During this time of economic upheaval and uncertainty, Jefferson County needs to support industries that will allow local economies to adapt and recover as fast as possible.

Voting no on ordinance #2017-302 will help protect water resources throughout Jefferson County. The type of industry that ordinance #2017-302 would allow puts the ground resources of Jefferson county at significant risk due to the karst hydrogeology. The site in Ranson is in the Rocky Marsh Run watershed, which is in the source water protection zone for Shepherdstown and drains to the Potomac River. Therefore, activity at this site will affect both groundwater and surface water streams. In municipalities like Shepherdstown, many residents and nearby farms depend on wells for water. Contamination of groundwater aquifers would create both health and remediation concerns for local residents. Dye tests performed by the USGS near the area of proposed rezoning in Ranson have shown just how far-reaching groundwater contamination at the Ranson site could be. Results from the USGS study revealed measurable dye concentrations in Elk's Run, Rattlesnake Run, and even the Shepherdstown Town Run. This last run cuts through the center of Shepherdstown and is a favorite area for children to play and learn to fish.

Groundwater pollution is not the only concern for communities like Shepherdstown. The type of industry that ordinance #2017-302 would allow in Ranson would also generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. These pollutants are particularly harmful to children. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. The site in Ranson is across the road from an elementary school and also within the Jefferson High Middle district. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of children in Shepherdstown and all of Jefferson County.

I again request that you vote no on ordinance #2017-302. The long-term economic, environmental, and community health of municipalities like Shepherdstown depend on Ranson's participation in a coordinated zoning plan for all of Jefferson County.

Sincerely,

Andrew Spiker

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would negatively affect tourism, economic agility, groundwater quality, and individual health in neighboring municipalities like Shepherdstown.

Tourism is critically important to Shepherdstown's economy and to the county as a whole. In 2018, tourist spending in the Jefferson County contributed over \$170 million to state and local government revenue and \$213 million in individual earnings. Importantly, most of this money comes from tourists visiting from neighboring states like Virginia, Maryland, and Washington D.C. Out-of-state tourists are largely drawn to Jefferson County because of its reputation for environmental-friendly, sustainable industry. Key elements that support this reputation include the county's pastoral scenery and pristine natural resources. Ordinance #2017-302 will allow industry into Jefferson County that risks harming these elements and dramatically reducing the area's appeal to visitors. The resulting harm to our tourist industry would drive away visitors and decrease state, county, and local revenue. The long-term success of Jefferson County's tourism industry is dependent on local governments making coordinated zoning decisions. Allowing certain types in industry in Ranson will negatively affect tourism in every municipality throughout the county, including Shepherdstown. Voting no on ordinance #2017-302 will protect the foundations of the county's tourism industry and protect the 7,040 jobs in Jefferson County that are directly supported by tourism.

The type of large, consolidated industry that ordinance #2017-302 would allow in Ranson would generally reduce the flexibility of local economies in Jefferson County. Historically, the driving industries in Jefferson County have been tourism, agriculture, and the equine industries. These three industries are large conglomerates of small businesses. Small business is very important to Sheherdstown. Small businesses have been shown to create more jobs, cultivate more innovation, and provide more opportunities than big, non-local firms. Additionally, small businesses have been shown to more reactive to sudden changes relative to manufacturing

businesses. Bringing large, manufacturing-based industry into Jefferson county will depress the local economy and stifle innovation. During this time of economic upheaval and uncertainty, Jefferson County needs to support industries that will allow local economies to adapt and recover as fast as possible.

Voting no on ordinance #2017-302 will help protect water resources throughout Jefferson County. The type of industry that ordinance #2017-302 would allow puts the ground resources of Jefferson county at significant risk due to the karst hydrogeology. The site in Ranson is in the Rocky Marsh Run watershed, which is in the source water protection zone for Shepherdstown and drains to the Potomac River. Therefore, activity at this site will affect both groundwater and surface water streams. In municipalities like Shepherdstown, many residents and nearby farms depend on wells for water. Contamination of groundwater aquifers would create both health and remediation concerns for local residents. Dye tests performed by the USGS near the area of proposed rezoning in Ranson have shown just how far-reaching groundwater contamination at the Ranson site could be. Results from the USGS study revealed measurable dye concentrations in Elk's Run, Rattlesnake Run, and even the Shepherdstown Town Run. This last run cuts through the center of Shepherdstown and is a favorite area for children to play and learn to fish.

Groundwater pollution is not the only concern for communities like Shepherdstown. The type of industry that ordinance #2017-302 would allow in Ranson would also generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. These pollutants are particularly harmful to children. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. The site in Ranson is across the road from an elementary school and also within the Jefferson High Middle district. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of children in Shepherdstown and all of Jefferson County.

I again request that you vote no on ordinance #2017-302. The long-term economic, environmental, and community health of municipalities like Shepherdstown depend on Ranson's participation in a coordinated zoning plan for all of Jefferson County.

Sincerely,

Andrea Hines
Shepherdstown, 25443

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on Ordinance #2017-302. Ranson's proposed zoning change presents a significant risk to the equine industry in Jefferson County and well beyond. The type of industry that would be allowed by the proposed zoning change in this location would jeopardize horse health, the groundwater supply, and workforce productivity. This will cause immediate shrinkage and threaten the long-term viability of the equine industry in the county.

The site of the proposed rezoning is less than six miles from Charles Town Races, with several breeding, training, and rehabilitation facilities between the two. The industry allowed by this rezoning would produce particulate, gaseous, and hazardous air emissions that would reach these sites. According to the WVDEP air permit, the Rockwool plant in Ranson is permitted to emit 250.87 tons of particulate matter per year into the air (1).

According to a recent study published in the journal of Veterinary Internal Medicine (2), horses are 15 times more sensitive to inhaled particulate matter than humans. Inhaled particulate matter can cause inflammation in horses' lungs that negatively affects performance. Inhaled particulate matter also contributes to the development of inflammatory airway disease (IAD) (3). IAD is a chronic airway disease that can affect horses long after their racing career is over. While there is little research on how other air pollutants affect horses, the effects of pollution on humans can be used to infer potential impact on horses. However unlike human models, these horses are elite athletes continuously exposed, and will thus likely experience detrimental effects at much lower levels of air pollution than humans.

The primary concern with air pollution is that increased levels of pollutants will increase inflammation in horses' lungs. Even small, subclinical amounts of inflammation in the lungs of horses negatively affect performance (2,3,4,5,6,11). This inflammation can also cause increased recovery times following racing (7,11). Reduced performance and training interruptions can lead to higher risk of injury, reduced winning average, fewer yearly starts, lower yearly

earnings, shortened career length, fewer lifetime starts, reduced lifetime earnings, and reduced quality of life (2,3,8,9,11). Each of these situations will lead to decreased return on investment, decreased cash flow, and decreased overall earnings for owners, trainers, and breeders with horses at Charles Town Races and in nearby areas.

While racing is usually a thoroughbred's first career, it is rarely their last. Some racing horses go on to be breeding stock, while others will have successful careers as sport horses. Jefferson County is an important source of new stock for sport horse trainers from Northern Virginia, and Maryland, and this is a resource for local horseman of both income and placement for horses not appropriate for breeding. However, if retired racehorses are unsound from injury or respiratory disease, they can be difficult to manage as breeding stock or unfit for a career as a sport horse. This affects the horse's quality of life and also places a burden on the industry locally and regionally.

The perception of decreased air quality from the increase in regional haze and visible smokestacks as one drives into the county will deter out of state owners and breeders from investing in West Virginia bred Race horses, decreasing or eliminating a critical \$50 million a year source of local business volume.

Another concern related to the proposed rezoning in Ranson is the risk of groundwater contamination as a result of the karst hydrogeology at the site and the industrial activity. Horsemen will either have to take on the expense of periodically testing water sources or they may not know local ground water is contaminated until their animals are sick. Veterinary care and testing adds expense and uncertainty to an industry that already deals with large inherent risks. The actual occurrence of ground water contamination would be devastating for Jefferson County's equine industry. For both geographic and financial reasons, it is simply impossible to think that the industry could solely use public or private utility-provided water if industrial activity fouled the local groundwater.

Finally, studies on US agricultural workers have demonstrated that increased air pollution decreases productivity of outdoors workers. This would place an additional burden on workers, small business owners and the industry.

The equine industry in Jefferson County is hundreds of years old. It is not worth risking this historic and economically valuable industry by rezoning for industrial companies like Rockwool. An economic impact study of the Charles Town Thoroughbred Horse Racing Industry on Jefferson County's economy found that the spending by owners, breeders, and trainers of the equine industry directly contributes \$79.4 million to the county each year. Out-of-state owners, breeders, and trainers spend more than \$50 million in Jefferson County every year. The value of total business volume in Jefferson County is \$191 million each year (10). These numbers do not include the effect of the handle or the casino.

The equine industry provides jobs for a broad cross-section of the public. This industry offers individuals of any educational background a variety of paths to achieve a good middle-income

living. Many jobs allow individuals to pursue apprenticeships or on-the-job training rather than requiring a costly college education. This flexibility allows for greater lifetime earnings and improved educational debt-to-earnings ratio for these workers. The equine industry also provides opportunities for non-traditional workers by offering job opportunities to those who may not be employable by larger corporations. This industry provides a variety of full-time, part-time, flexible, and pick-up work. Encouraging this type of flexible job ecosystem helps create a healthy economy with broad participation in employment and consumption.

The equine industry is a large conglomerate of small businesses, which have a multitude of economic benefits over having a few large businesses. It has been extensively reported that small locally owned businesses and start ups create more jobs, cultivate innovation, generate higher incomes, and provide more opportunities for individuals that would otherwise not exist than big non-local firms, which can actually depress local economies. The equine industry provides opportunities for small businesses and startups responsible for this growth of better jobs that are so good for the economy.

The equine industry offers so many other benefits that the industry in the rezoned area would not. For example, the equine industry supports local agriculture by providing a market for agricultural goods such as straw. The robust straw market supported by owners, trainers, and breeders allows for a third cash crop to be produced from one field in a year. Through pastureland and support of local agricultural goods, the equine industry protects and preserves the open spaces that give our county its bucolic quality and help attract tourists. Through the breeders' incentive programs, the equine industry offers unique opportunities to draft state funds back to Jefferson County, to name a few.

Rezoning this area of Ranson for Special District Industrial will allow in entities whose activities are harmful to the equine industry. The losses incurred by the equine industry would far outweigh any benefits derived from industries occupying the rezoned area. Sacrificing the long-term viability of one of our oldest and most productive industries for a net loss in business volume and economic value just does not make good sense for the local economy. Please vote NO on Ordinance #2017-302.

Sincerely,

Casey Alexander

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on #2017-302. The air emissions, possibility of ground and surface water contamination, and their effect on our interwoven economies threaten the health, safety and welfare of not just Jefferson County but the greater region, including Loudoun and the greater Northern Virginia area.

This zoning would provide for industry that produces large amounts of air emissions. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. Northern Virginia is directly downwind from these emissions. Much of the gaseous, fine particulate, and hazardous emissions can reach Northern Virginia. Further affecting the outdoor air quality of the adjacent portion of Virginia and the ability of these areas to achieve and maintain National Ambient Air Quality Standards (NAAQS) attainment. This will affect agriculture and outdoor leisure and recreation.

For example, Loudoun County has been in nonattainment for the NAAQS 8-hour Ozone standard for the past two years. VOC and NO_x react after they have been emitted to produce ground level ozone. The industry that this rezoning would provide for would produce large amounts of these emissions. This would make it even harder as Loudoun County tries to achieve attainment. As time goes on and the scientific research advances our knowledge and understanding of the extent to which gaseous, particulate and hazardous emissions affect human health the NAAQS standards are likely to be reduced. The effects on air emission from this rezoning will make it only harder for Loudoun and Northern Virginia to meet these standards.

In addition to the concerns about the air, the possible ground and surface water contamination is very concerning to Loudoun and Virginia residents. The site is known to have ground water that is vulnerable to contamination due to the karst hydrogeology. A USGS study demonstrated that the ground water adjacent to the site to be rezoned communicates readily with surface

water tributaries of the Potomac River. In addition to direct infiltration where water moves directly from the surface to groundwater via porous limestone bedrock, karst is known to have severe ground instability problems. This makes karst geology prone to sinkhole development. Sinkholes provide direct connection between the surface water and any contaminants it may contain and the groundwater. This makes the aquifer vulnerability in karst areas very high, and contamination with industrial activity such as that provided for by this rezoning too likely.

Loudoun sources its drinking water from the Potomac River, downstream of many West Virginia tributaries that carry water from the epikarst and groundwater aquifer at the site to be rezoned. Loudoun has recently completed the new Trap Rock Water Treatment facility, which draws water from the Potomac River. Loudoun currently provides 40 million gallons and projects to provide 90 million gallons of drinking water a day to customers by 2040 (Loudounwater.org). Therefore, the viability of the Potomac River is a high priority for Virginia residents.

Loudoun and Northern Virginia is one of the fastest growing communities in the country and provides a lot to Jefferson County in their symbiotic relationship. Virginia residents support and enjoy Jefferson County through tourism, as our residents enjoy the natural and historical resources of your county. Virginia residents and businesses support the equine industry in a multitude of ways from providing wagering fans at the races to the Virginia Breeders Association Virginia Certified incentive programs and a strong market for retired racehorses. According to an economic impact study from WVU, at least 40% of Jefferson County residents travel outside of West Virginia for work, a good percentage of those travel to northern Virginia. This rezoning would allow for industry that would negatively affect the economy of both places and this relationship and the benefits for our residents gleaned from it.

This zoning change will provide for industry that will negatively effect the health safety and welfare of the Loudon and Northern Virginia community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Nicole Flory

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on Ordinance #2017-302. Ranson's proposed zoning change presents a significant risk to the equine industry in Jefferson County and well beyond. The type of industry that would be allowed by the proposed zoning change in this location would jeopardize horse health, the groundwater supply, and workforce productivity. This will cause immediate shrinkage and threaten the long-term viability of the equine industry in the county.

The site of the proposed rezoning is less than six miles from Charles Town Races, with several breeding, training, and rehabilitation facilities between the two. The industry allowed by this rezoning would produce particulate, gaseous, and hazardous air emissions that would reach these sites. According to the WVDEP air permit, the Rockwool plant in Ranson is permitted to emit 250.87 tons of particulate matter per year into the air (1).

According to a recent study published in the journal of Veterinary Internal Medicine (2), horses are 15 times more sensitive to inhaled particulate matter than humans. Inhaled particulate matter can cause inflammation in horses' lungs that negatively affects performance. Inhaled particulate matter also contributes to the development of inflammatory airway disease (IAD) (3). IAD is a chronic airway disease that can affect horses long after their racing career is over. While there is little research on how other air pollutants affect horses, the effects of pollution on humans can be used to infer potential impact on horses. However unlike human models, these horses are elite athletes continuously exposed, and will thus likely experience detrimental effects at much lower levels of air pollution than humans.

The primary concern with air pollution is that increased levels of pollutants will increase inflammation in horses' lungs. Even small, subclinical amounts of inflammation in the lungs of horses negatively affect performance (2,3,4,5,6,11). This inflammation can also cause increased recovery times following racing (7,11). Reduced performance and training interruptions can lead to higher risk of injury, reduced winning average, fewer yearly starts, lower yearly

earnings, shortened career length, fewer lifetime starts, reduced lifetime earnings, and reduced quality of life (2,3,8,9,11). Each of these situations will lead to decreased return on investment, decreased cash flow, and decreased overall earnings for owners, trainers, and breeders with horses at Charles Town Races and in nearby areas.

While racing is usually a thoroughbred's first career, it is rarely their last. Some racing horses go on to be breeding stock, while others will have successful careers as sport horses. Jefferson County is an important source of new stock for sport horse trainers from Northern Virginia, and Maryland, and this is a resource for local horseman of both income and placement for horses not appropriate for breeding. However, if retired racehorses are unsound from injury or respiratory disease, they can be difficult to manage as breeding stock or unfit for a career as a sport horse. This affects the horse's quality of life and also places a burden on the industry locally and regionally.

The perception of decreased air quality from the increase in regional haze and visible smokestacks as one drives into the county will deter out of state owners and breeders from investing in West Virginia bred Race horses, decreasing or eliminating a critical \$50 million a year source of local business volume.

Another concern related to the proposed rezoning in Ranson is the risk of groundwater contamination as a result of the karst hydrogeology at the site and the industrial activity. Horsemen will either have to take on the expense of periodically testing water sources or they may not know local ground water is contaminated until their animals are sick. Veterinary care and testing adds expense and uncertainty to an industry that already deals with large inherent risks. The actual occurrence of ground water contamination would be devastating for Jefferson County's equine industry. For both geographic and financial reasons, it is simply impossible to think that the industry could solely use public or private utility-provided water if industrial activity fouled the local groundwater.

Finally, studies on US agricultural workers have demonstrated that increased air pollution decreases productivity of outdoors workers. This would place an additional burden on workers, small business owners and the industry.

The equine industry in Jefferson County is hundreds of years old. It is not worth risking this historic and economically valuable industry by rezoning for industrial companies like Rockwool. An economic impact study of the Charles Town Thoroughbred Horse Racing Industry on Jefferson County's economy found that the spending by owners, breeders, and trainers of the equine industry directly contributes \$79.4 million to the county each year. Out-of-state owners, breeders, and trainers spend more than \$50 million in Jefferson County every year. The value of total business volume in Jefferson County is \$191 million each year (10). These numbers do not include the effect of the handle or the casino.

The equine industry provides jobs for a broad cross-section of the public. This industry offers individuals of any educational background a variety of paths to achieve a good middle-income

living. Many jobs allow individuals to pursue apprenticeships or on-the-job training rather than requiring a costly college education. This flexibility allows for greater lifetime earnings and improved educational debt-to-earnings ratio for these workers. The equine industry also provides opportunities for non-traditional workers by offering job opportunities to those who may not be employable by larger corporations. This industry provides a variety of full-time, part-time, flexible, and pick-up work. Encouraging this type of flexible job ecosystem helps create a healthy economy with broad participation in employment and consumption.

The equine industry is a large conglomerate of small businesses, which have a multitude of economic benefits over having a few large businesses. It has been extensively reported that small locally owned businesses and start ups create more jobs, cultivate innovation, generate higher incomes, and provide more opportunities for individuals that would otherwise not exist than big non-local firms, which can actually depress local economies. The equine industry provides opportunities for small businesses and startups responsible for this growth of better jobs that are so good for the economy.

The equine industry offers so many other benefits that the industry in the rezoned area would not. For example, the equine industry supports local agriculture by providing a market for agricultural goods such as straw. The robust straw market supported by owners, trainers, and breeders allows for a third cash crop to be produced from one field in a year. Through pastureland and support of local agricultural goods, the equine industry protects and preserves the open spaces that give our county its bucolic quality and help attract tourists. Through the breeders' incentive programs, the equine industry offers unique opportunities to draft state funds back to Jefferson County, to name a few.

Rezoning this area of Ranson for Special District Industrial will allow in entities whose activities are harmful to the equine industry. The losses incurred by the equine industry would far outweigh any benefits derived from industries occupying the rezoned area. Sacrificing the long-term viability of one of our oldest and most productive industries for a net loss in business volume and economic value just does not make good sense for the local economy. Please vote NO on Ordinance #2017-302.

I respectfully request that you vote no on #2017-302. The air emissions, possibility of ground and surface water contamination, and their effect on our interwoven economies threaten the health, safety and welfare of not just Jefferson County but the greater region, including Loudoun and the greater Northern Virginia area.

This zoning would provide for industry that produces large amounts of air emissions. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. Northern Virginia is directly downwind from these emissions. Much of the gaseous, fine particulate, and hazardous emissions can reach Northern Virginia. Further affecting the outdoor air quality of the adjacent portion of Virginia and the ability of these areas to achieve and maintain National Ambient Air Quality Standards (NAAQS) attainment. This will affect agriculture and outdoor leisure and recreation.

For example, Loudoun County has been in nonattainment for the NAAQS 8-hour Ozone standard for the past two years. VOC and NO_x react after they have been emitted to produce ground level ozone. The industry that this rezoning would provide for would produce large amounts of these emissions. This would make it even harder as Loudoun County tries to achieve attainment. As time goes on and the scientific research advances our knowledge and understanding of the extent to which gaseous, particulate and hazardous emissions affect human health the NAAQS standards are likely to be reduced. The effects on air emission from this rezoning will make it only harder for Loudoun and Northern Virginia to meet these standards.

In addition to the concerns about the air, the possible ground and surface water contamination is very concerning to Loudoun and Virginia residents. The site is known to have ground water that is vulnerable to contamination due to the karst hydrogeology. A USGS study demonstrated that the ground water adjacent to the site to be rezoned communicates readily with surface

water tributaries of the Potomac River. In addition to direct infiltration where water moves directly from the surface to groundwater via porous limestone bedrock, karst is known to have severe ground instability problems. This makes karst geology prone to sinkhole development. Sinkholes provide direct connection between the surface water and any contaminants it may contain and the groundwater. This makes the aquifer vulnerability in karst areas very high, and contamination with industrial activity such as that provided for by this rezoning too likely.

Loudoun sources its drinking water from the Potomac River, downstream of many West Virginia tributaries that carry water from the epikarst and groundwater aquifer at the site to be rezoned. Loudoun has recently completed the new Trap Rock Water Treatment facility, which draws water from the Potomac River. Loudoun currently provides 40 million gallons and projects to provide 90 million gallons of drinking water a day to customers by 2040 (Loudounwater.org). Therefore, the viability of the Potomac River is a high priority for Virginia residents.

Loudoun and Northern Virginia is one of the fastest growing communities in the country and provides a lot to Jefferson County in their symbiotic relationship. Virginia residents support and enjoy Jefferson County through tourism, as our residents enjoy the natural and historical resources of your county. Virginia residents and businesses support the equine industry in a multitude of ways from providing wagering fans at the races to the Virginia Breeders Association Virginia Certified incentive programs and a strong market for retired racehorses. According to an economic impact study from WVU, at least 40% of Jefferson County residents travel outside of West Virginia for work, a good percentage of those travel to northern Virginia. This rezoning would allow for industry that would negatively affect the economy of both places and this relationship and the benefits for our residents gleaned from it.

This zoning change will provide for industry that will negatively effect the health safety and welfare of the Loudon and Northern Virginia community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Nancy Feeney

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask that you vote no on Ordinance #2017-302. While not in Ranson, the land and homes around the property that is the subject of the zoning change are closer to the property than anyone who currently lives within the city limits of Ranson. This area will be affected sooner and more harshly by the environmental issues that will develop secondary to the inappropriate siting of industry this zoning would allow.

The subject land has been well studied by Drs. Kozar, Doctor and Doctor and described in the scientific literature and USGS reports as having karst hydrology with very high aquifer vulnerability. The karst landscape is a consequence of the presence of soluble bedrock, which consists of limestone in the case of the subject land. In such landscapes water percolates through the ground and dissolves the underlying rock creating a porous network of caverns and throughways. Karst aquifers are known to be "extremely vulnerable to pollution" due to direct connection between the surface water and groundwater through both point (sinkholes) and diffuse (everywhere) infiltration. It is known from the Voluntary Remediation Plan of Jefferson Orchard that the groundwater at the subject site is only 60 feet below the ground. The subject property and much of the property around it are on an upland plain with few surface streams, but great seasonal variability in the water table resulting in numerous estevelles and large amounts of water in the epikarst. This water is easily contaminated and this contamination spreads quickly throughout the aquifer. Dye tests performed near the subject site by the USGS have demonstrated this quick moving thorough dispersement in the aquifer in this area. While this contamination goes on to affect springs at the margins of the upland area continuing on in streams that service municipal water sources and the Potomac River, our concerns are far more immediate in both time and distance. Well water is the only water source available in the area of the proposed zoning change and, with the exception of Fox Glen, a majority of this water is supplied by private wells. Therefore, the groundwater aquifer fulfills a critical necessity, fulfilling all needs including human consumption, household uses, and agriculture and

maintenance of livestock and horses in the immediate area around the site. The concern is that if the aquifer becomes contaminated, then the local drinking water will be fouled.

For decades now, policy makers have been using “Aquifer Vulnerability,” to set land use and water resource protection policy. Karst has very high Aquifer Vulnerability. Therefore, this industrial use is not appropriate for this land and it should not be zoned for it. The guiding documents of the WVDEP recognize this. The introduction to the WVDEP document *Stormwater Management Design in Karst Areas* states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.”

The Chesapeake Bay Stormwater Network karst stormwater guidance document the *CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed*, which the WVDEP cites in its own guiding document *Stormwater Management Design in Karst Areas*, clearly agrees stating

“First, the effect of land development on karst terrain is complex and hard to predict, and requires professional analysis to reduce the risk of geological hazards, damage to infrastructure and groundwater contamination.”

“The working group acknowledges that past approaches to stormwater and land development in karst terrain have been inadequate to safeguard the public and the environment.”

“...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.”

We clearly need stronger comprehensive land use plans and zoning that direct new growth away from karst areas to more appropriate locations. Ordinance #2017-302 is literally the opposite of this.

Further, we cannot rely on the WVDEP to do the job that good local land use guidelines and zoning should do. For example, the *CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed* states that detention and retention ponds are not recommended on karst and categorize them as discouraged. Also, quoting WVDEP’s own karst guidance: “attenuating surface runoff will increase the rate of sinkhole formation and potential groundwater contamination.” Yet the entity currently planning to utilize this zoning change is planning employment of multiple massive retention ponds and attenuating surface runoff completely. This has already been approved by the DEP in two Construction Stormwater General Permit registrations for that company. One of detention ponds is not even regulated by the DEP as it contains process water and has no outlet. Clearly the DEP recognizes the risks but is not appropriately limiting them. Relying on the DEP to protect the public health, safety, welfare, and the environment from any entity in these karst locations is simply as the CNS bulletin said it “inadequate to safeguard the public and the environment.” We must have appropriate zoning that takes into consideration appropriate use of land with karst

hydrogeology. Ordinance #2017-302 does not do this, but instead increases the risk to the public and the environment.

A second serious concern is the air emissions from the industry that this zoning will provide for. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. These types of air emissions have been shown to increase the risk of, contribute to, and exacerbate a multitude of developmental, physical, physiological, physiological, cognitive and economic. The exposure of one individual can cause repercussions in multiple generations. Embryos, fetuses, and children are most vulnerable with effects born out over a lifetime, and that of their offspring. Many of these effects only require short-term exposure and some have even been shown to occur at levels below current limits recommended by the World Health Organization. One example of this is that a recent study found that “Even within the limits set by the World Health Organization, the pollutants PM10, SO₂, NO₂, and O₃ are associated with increased risk of treatment for respiratory diseases in children 0 to 6 years of age.” Unfortunately, the US limits are higher than WHO, 300 % higher in the case of PM10!

In fact, in 2019, in the Advice from the Independent Particulate Matter Review Panel (formerly U.S. EPA Clean Air Scientific Advisory Committee Particulate Matter Review Panel) on EPA’s Policy Assessment for the Review of the National Ambient Air Quality Standards for Particulate Matter, it stated that the committee unanimously and unequivocally found that the current primary annual and 24-hour PM_{2.5} National Ambient Air Quality Standards (NAAQS) are not adequate to protect public health. The advice from this 20-member committee, whose scientific disciplines include epidemiology, medicine, toxicology, air quality measurement, air quality modeling, exposure assessment measurement and modeling, risk assessment, statistics, and others, was ignored due presumably to political pressure. Not only are the NAAQS too high in some cases, but due to the measure and mechanism by which they work, they can not replace the safety provided by good land use and zoning regulations, that are meant to do things like keep factories with air emissions and hundreds of heavy trucks away from elementary schools. In fact, there is a state law that prohibits siting a school near a factory. Unfortunately, the reciprocal law does not exist. Clearly, just like with the water resources, we cannot rely on the DEP or the EPA to do the job of what appropriate zoning should do. The whole point of zoning is to keep people safe and provide for their health and welfare. Ordinance #2017-302 puts families and school children directly in harms way.

The air emissions, threat to the groundwater, and the very presence of the industry that this zoning change will allow for will have a serious negative economic effect on those who live and or work closest to the site in question. Productivity and workforce participation will be negatively affected by the health effects of the air emissions. The local agricultural operations will be negatively affected by the air emissions with lower quantity and quality of crop yield and would be devastated if the ground water aquifer were fouled. The equine operations in the area, of which there are several, will be negatively affected by the air emissions as they affect the horses’ health and performance. The mere presence of the industry that will be provided

for by this zoning change will cause property values to fall. There will be serious economic consequences for the immediate area around the site in question.

Several of the communities in the immediate area of the site for proposed zoning change are traditionally underserved and have lower economic status. The choice of this location for such a zoning change represents an egregious example of environmental injustice that should not be promulgated or tolerated.

This zoning change will provide for industry that will negatively affect the health safety and welfare of our community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Jennifer King

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask you to vote NO on Ordinance #2017-302. The industry this zoning change will allow for endangers the health, safety and, welfare of the community, and violates the premise of the smart code zoning that we have spent so much time, effort and federal money employing.

Any change in zoning needs to align with the comprehensive plan. In Ranson's current comprehensive plan (2012), the City only refers to "heavy industry" in the history section. Here it is characterized as part of a bygone era that has been replaced by an emphasis on agriculture for local food production, open spaces, and quality-of-life. In the remainder of the document, the word industry is used loosely to describe businesses including flower shops and shoe stores. Nothing that resembles the industry that this zoning change will provide for is described in the current comprehensive plan of Ranson.

In the land use section of the comprehensive plan, number ten states:

"Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The comprehensive plan clearly states that the city will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community. This change in zoning clearly negatively affects the health, safety, and welfare of the community.

As the zoning is proposed, the industry that this zoning change will allow for will be directly across the street from houses, parks and other small businesses. A densely populated subdivision and an elementary school already exit directly across the street. While these latter

community sections are not in the city limits, the effect of this zoning on them should still be considered just the same as it would be if they were in the city limits.

The industry that this zoning change will provide for will produce particulate, gaseous, and hazardous air emissions. These emissions have been shown to be detrimental to human health at every stage of life from embryo to old age. In utero and childhood exposure are the most damaging with lasting effects being realized through out life, and with maternal exposure the effects can be felt for generations. Multiple organ systems are affected including respiratory, cardiovascular, neurologic, immune, and endocrine causing defects in multiple processes including in utero development, neurodevelopment, immune and tolerance development, and cognitive defects. There are also psychological, social, and economic effects from both perceived and actual air pollution in both children and adults. Many of these effects can be seen even with short-term exposure or exposure that is lower than the levels recommended by the US Environmental Protection Agency and World Health Organization. These consequences are devastating to the individual and depressing to the local community and economy. State law does not allow a school to be built next to industry that this zoning will allow but yet we are contemplating changing the zoning so this industry can build next to a school. This does not make sense. As Ranson residents, we want Ranson to follow the lead of the state and keep polluting industry away from kids. In these ways, this change in zoning will negatively affect the health and welfare of the community.

In addition to the health effects of the air emissions is the threat to groundwater from the industry that this zoning change would allow. The land in question has karst hydrogeology and therefore very high aquifer vulnerability and is not appropriate for this industry. With the type of industry this zoning will provide for, combined with high aquifer vulnerability, the likelihood of groundwater contamination is too high for the community and region to bear. A USGS study demonstrated that contamination in the groundwater adjacent to the site moves relatively quickly and can be found in wells and surface water structures in a variety of locations in the County. In this way, contamination at the site would affect the drinking water of the great majority of Jefferson County residents. Through the surface water connections, the water at the site also affects the water resources of the region.

Aquifer vulnerability has been used by policy makers for decades to set land use regulations. The guiding document, from the WVDEP, *Stormwater Management Design in Karst Areas* states, "it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." In Ranson, we need to follow this advice and not change the zoning of this land for use by industry that has among the highest aquifer vulnerability in the County. This zoning change will endanger the safety of the community and region by endangering the safe water resources. As Ranson residents, we want to safeguard the water resources of the county and region by following the WVDEP guidance here.

Further, by reallocating this transect district and replacing it with a monolithic block of Special District Industrial designation, hundreds of housing units, parks and space for small businesses are lost. Ranson loses the potential for property tax on these properties and their improvements, Business and Occupational tax on the businesses and sales tax in retail stores. The community loses out on the opportunity to develop affordable housing and create locations where people can live, work, play, and shop all in the same place reducing the need for travel.

Worse yet apparently a deal has been made where the entity that owns the subject land has required that a litany of things not be built on the adjacent land essentially stripping the purpose of the smart code transect zone that exists there. Transect zones in the smart code are meant to transition, from out to in, and provide communities where people can safely work and live in close proximity in an effort to reduce travel. Excluding many of the components of the transect zone effectively eliminates the features that make it a transect zone, thus, losing the benefits a transect zone offers the community and city. By losing these benefits, reducing the overall and affordable housing prospects, and reducing so drastically the opportunities for city income, this zoning change will negatively affect the welfare of the community.

As Ranson residents, we find it odd that we are changing zoning to provide for industry that we would not put in the middle of our town close to our residents, but we are placing it close to the homes of county residents. Further, it is striking that the area where this change in zoning is directly adjacent to historically underserved lower income communities and a Title I school. This amounts to environmental injustice and cannot be tolerated.

The purpose of zoning is for a city to protect the health, welfare, morals and safety of the community. In this case, the air emissions and heavy truck traffic will endanger the communities' health. The threat of water contamination will endanger the safety of the community. The effect of lost productivity and decreased workforce participation due to increased illness and the negative effect the air emissions and presence of such a factory will have on the local economy will negatively affect the welfare of the community. The environmental injustice of changing the zoning to accommodate such polluting industry in a location where your municipality has no residents, but yet hundreds of low income and underserved county residents live is egregiously amoral. This must not happen. We respectfully implore you to do the right thing and vote no on ordinance #2017-302.

Sincerely,

Jennifer King

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

This land and this location are not appropriate for the industry this zoning change will allow. The hydrogeology of the land combined with such industrial activity risks the safety of our water supply. The air emissions from this industry will negatively impact our physical and mental health, our children's ability to achieve, our ability to make a living, our happiness, and it will do this for generations even after we leave or the pollution stops. It is not lost on us that this zoning change is being made next to our neighborhood and not next to the residents of Ranson, yet Ranson is in control. This is not right. We respectfully ask you to vote NO on ordinance #2017-302.

The land at the site in question is not just ill-suited, but completely inappropriate for the industry this zoning change will allow. This land has karst hydrogeology. As such, the ground itself is very unstable and readily develops sinkholes. This land has been described by a 2012 study to be exceptionally susceptible to sinkhole formation, more so than most of the rest of the county. Sinkholes provide point infiltration of surface water into the water in the epikarst. The porous bedrock allows diffuse infiltration of surface water into the epikarst water. At this site, there is also large amounts of water in the epikarst and it is only 60 feet from the surface. This allows the water at the surface to easily communicate with the water in the epikarst and the groundwater aquifer carrying any surface water contaminants with it.

The industrial activity this zoning change will allow for will cause ample surface water contamination from ground level industrial activities, raw material and waste storage and particulate matter falling to the ground from the air emissions. The industry that is currently planning to utilize this zoning change should be designated a stormwater hotspot just for this reason. The WVDEP should require them to treat all water before it is allowed to infiltrate the ground, but so far, this has not been done. The WVDEP actually recommends that areas like this not be developed due to the risk to groundwater. Their guiding document, *Stormwater Management Design in Karst Areas* states, "it is important to note that the potential for

geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that the best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” This guidance should be followed; clearly we cannot expect the DEP to protect us from inappropriate zoning changes.

The wellhead protection area for the Fox Glen’s well and that of the elementary school where our children go to school intersects with the land where the zoning change is being proposed. However, a USGS study has shown that the groundwater aquifer here moves relatively fast and so contamination throughout this property is a concern for our water quality. This zoning change will clearly endanger the safety of our water supply. If the well at Fox Glen is contaminated and the utility is forced to divert water from further away, this may be used as evidence at the Public Service Commission to raise the water tariff on Fox Glen residents. This is an increase many will not be able to afford, raising the risk of water insecurity.

The air emissions that will be produced by the industry that this zoning will allow include gaseous (SO_2 , NO_2 , O_3 (VOC and NO_x)), particulate matter (PM_{10} , $\text{PM}_{2.5}$, $\text{PM}_{0.1}$), and hazardous emissions (neurotoxins and carcinogens). We will be exposed through our lungs from the air we breathe, through our skin from the air and things we contact, and through contaminated things we may ingest. Our kids will be more exposed because they spend more time playing outside and on the ground and kids like to put things in their mouth. In fact, according to the National Academy of Science, our kids are more at risk because they breathe more air per pound than adults, their detoxification pathways are less mature, they are growing and developing and these processes are more sensitive, and they have more years to live yet and thus more years to develop slow onset diseases. Exposure to air pollution in early human development, especially exposure to fine particulate pollution, can be extremely deleterious to children's health and development.

The negative effects start in utero. Embryonic and fetal cells are exquisitely sensitive and are affected directly by inhaled pollutants that cross the placenta like fine particulate matter as well as other secondary pathways causing impaired organ development, disturbed development of the immune system, premature birth, lower birth weight, and increased infant mortality. These early changes lead to long-term effects including increased disease development in multiple organ systems throughout life, cognitive defects, achievement deficits, and negative psychological social and economic effects.

Fetal and early life exposure to air pollution causes inappropriate brain growth and maturation in early life, neurodevelopmental disorders, early cognitive deficits, and has been associated with autism by several case-control studies. Several studies have demonstrated a scholastic deficit in exposed children for almost all subject matter and at a variety of grade levels. The cause of these findings are multifactorial and researchers suggested they include exacerbation of asthma symptoms, other decreased health parameters, increased fatigue, increased absence, or a direct neurodegenerative effect, all caused by or contributed to by the exposure to air pollution.

Development of the respiratory system starts in utero, is 80% complete by age 6, and continues to early 20s. A review by Korten et. al. in 2017 explained that exposure to air pollution during the first 6 years of life can damage the lung tissue, impair lung growth, and alter the development of immune function and repair mechanisms within the lungs. These effects increase both short- and long-term risk for asthma, chronic obstructive pulmonary disease (COPD), lung cancer, and respiratory infections. Exposure to outdoor air pollution not only increased the risk of these diseases, but exacerbates existing disease increasing severity of symptoms, hospital visits, and death due to these diseases. A 2019 study found “even within the limits set by the World Health Organization, the pollutants PM10, SO2, NO2, and O3 are associated with increased risk of treatment for respiratory diseases in children 0 to 6 years of age.” It is important to note that the US limits are set higher than the WHO, 300% higher in the case of PM10!

There are a multitude of other physiologic effects of air pollution that cause increased rates of morbidity and mortality in both adults and children. Air pollutants are associated with increased risk of autoimmune diseases like asthma, allergies, and eczema. Air pollution has deleterious effects the cardiovascular system, endocrine system and blood, contributing to the occurrence of high blood pressure, high cholesterol, obesity, anemia, and stroke.

There are psychological effects as well. A review, of 178 published articles by Lu published in 2020, systematically examined the psychological (affective, cognitive, behavioral), economic, and social effects of air pollution and found: “Affectively, air pollution decreases happiness and life satisfaction, and increases annoyance, anxiety, mental disorders, self-harm, and suicide. Cognitively, it impairs cognitive functioning and decision making. Behaviorally, air pollution triggers avoidance behavior, defensive expenditure, and migration as coping strategies. Economically, it hurts work productivity and stock markets. Socially, it exacerbates criminal activities and worsens perception of the government. Importantly, both actual and perceived air pollution levels matter.”

Through negative physical and mental health effects air pollution has been shown to decrease an individual’s productivity and ability to participate in the workforce, negatively impacting workforce availability and overall productivity. This negatively impacts individual workers, companies, and the local economy. It also decreases individual’s ability to relocate themselves or their family into an area less affected by pollution. In this way a vicious cycle is set up where successive generations are exposed to the same pollutants and experience the negative effects of the ongoing exposure to pollution. This is not a fate the children of Fox Glen deserve to have thrust upon them by this zoning change and the industry that it will allow into our bucolic county. An editorial in the New England Journal of Medicine, commenting on several recent studies, stated: “The best control strategy from the standpoint of human health, supported by the scientific evidence to date, is to reduce the levels of all types of air pollutants. Our children’s health depends on it.”

The area surrounding the location, of the proposed zoning change that will accommodate heavier types of industry, is historically lower income and underserved. Deciding to locate a tract of such zoning in this location when it is on the whole unwanted and totally inappropriate for the land and surroundings is an example of environmental injustice. The Lancet Commission on Pollution and Health, citing the United Nation's Universal Declaration of 1948 on Human Rights, found that "pollution threatens fundamental human rights - the right to life, the right to health, the right to well-being, and the rights of the child." This rezoning represents not only a bygone era of economic development but a bygone era of environmental injustice and human rights violation.

The Lancet Commission on Pollution and Health further found that prevention of non-communicable diseases will require pollution prevention and that this will require fundamental changes in societal patterns of production, consumption, and transportation. This will require a paradigm shift to a more sustainable economic model based on recognition of human rights. They also found this is a major unexploited opportunity in society that many communities are grappling with undertaking. The movement away from the smart code zoning, with it integrated walkable communities, to large tracts of land dedicated to polluting industry close to a title one school is the exact opposite of this. This rezoning would represent a major step in the wrong direction for disease prevention, human rights, Ranson, and Jefferson County!

This change in zoning is not appropriate for this land and this area. This land itself is not well suited for the industry this zoning change would allow. This industry would severely adversely affect the health, safety and welfare of our community. Please vote NO on the Ordinance #2017-302.

Sincerely,

Jennifer King

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would put at risk the health and well being of children of Jefferson County.

The type of industry that ordinance #2017-302 would allow in Ranson would generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. Exposure to these pollutants has devastating effects on children's health. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. Developing fetuses whose mothers are exposed to air pollution are more likely to have impaired organ development which can lead to early cognitive deficits, neurodevelopmental defects and other physical, cognitive, and psychological deficits later in life. An association between autism and prenatal exposure to particulate matter in air pollution has been demonstrated in several studies. Many studies have shown that lower test scores in math, English, and language arts are associated with exposure to outdoor air pollution. Industrial activity allowed by ordinance #2017-302 would also increase the risk of groundwater contamination in Ranson and nearby municipalities. Children whose families rely on well water, as is the case in much of Jefferson County, may be affected by polluted water. Voting no on ordinance #2017-302 will prevent air and water pollution from negatively affecting the long-term health of children in Jefferson County and surrounding areas.

The economic and environmental harm caused by the type of industry that ordinance #2017-302 would allow would put additional stress on the parents, caretakers, and teachers of children in affected areas. The weakening and destabilizing of this support network would have negative effects on local children. Many households in Jefferson County depend on the local agriculture, tourism, and equine industries for income. If industrial activity in Ranson depresses these industries, the resulting financial strain on these households will introduce additional

stress and uncertainty into children's lives. Households living in areas affected by particulate matter and regional haze will also suffer from the psychological effects of air pollution. Individuals living in areas with increase perception of pollution show increased levels of stress, anxiety, and unhappiness. School districts affected by increased air and water pollution may have trouble recruiting and retaining teachers. Teachers have a large influence on a child's daily life and, if educator quality and tenure decreases, the quality of this influence will diminish.

The site of the proposed rezoning in Ranson is across the road from an elementary school and proximal to lower-income neighborhoods. Observations like these demonstrate how ordinance #2017-302 would disproportionately affect vulnerable and historically-disadvantaged populations. The damaging health effects of air pollution have been shown to persist for at least three generations, so allowing certain types of industry in low-income areas would only compound existing disadvantages. Voting no on ordinance #2017-302 would be a step towards acknowledging that all individuals have the right to clean air and water.

Children face increased exposure to air pollution, groundwater contamination, financial instability, and environmental discrimination if ordinance #2017-302 is passed. Please vote no on ordinance #2017-302.

Sincerely,

Jennifer King
Kearneysville, 25430

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask you to vote NO on Ordinance #2017-302. The industry this zoning change will allow for endangers the health, safety and, welfare of the community, and violates the premise of the smart code zoning that we have spent so much time, effort and federal money employing.

This zoning change will provide for industry that will negatively affect the agriculture industry in Jefferson County and beyond. The combination of the air emissions and threat to the ground water resources could have devastating consequences for the agricultural community of Jefferson County.

Eversweet Apiaries, is located in Kearneysville less than a mile from Rockwool's proposed plant. We have many hives at our shop and our 50+ hives are all located within a 3 mile radius of Rockwool. These beehives have been maintained in Jefferson County since my late Father started the business more than 15 years ago.

Bees pollinate one out of every three bites of food we eat and contribute nearly \$20 billion to the value of U.S. crop production. Unfortunately, honeybee and other pollinator populations have decreased over several decades due to many environmental problems, including loss of habitat and foraging sources.

Rockwool's air pollution will negatively affect my honeybees & hive products in the following ways:

- 1) Honeybees rely on their acute sense of smell to locate flower sources. Honeybees teach their hive mates where floral sources are by communicating through touch and smells (pheromones). Studies have shown that air pollution masks or destroys floral scents, making it difficult for honeybees' to find food to collect and to relay information back to their colony. Not

only does air pollution adversely affect bees ability to find food but it increases their foraging activity; which in turn, significantly decreases their life span. My bees will starve, be overworked, and die prematurely from Rockwool's air pollutants. In addition, my bees will not be able to pollinate crops efficiently resulting in diminished harvests for farmers.

2) Honeybees are a representation of our environment. They intake water and nectar, they land on soil, and they collect pollen from trees and flowers. Studies have shown that air pollutants contaminate honey, pollen, and beeswax. Honey, pollen, and beeswax are important commodities to my business and testing for contaminants will be an extreme financial burden upon my company.

3) Studies have shown air pollution weakens plants and makes them more susceptible to insect infestation. As stated above, loss of foraging sources is a major contributor to honeybee decline. Studies have also shown that air pollutants, particular carbon dioxide, have risen in plant pollen which decreases pollen's protein levels. Pollen provides protein for young and adult honeybees. The adverse impact of rising carbon dioxide concentrations in pollen may be playing a role in the global decline of bee populations by damaging bee nutrition, their developmental growth, and their reproductive success.

Long term studies of air pollutants' adverse effects on our environment have been conducted and published for decades. All of the above studies mentioned can easily be found on the internet by searching "honeybees air pollutants" and "plant air pollutants".

The agriculture industry in Jefferson County is hundreds of years old and continues to serve our community well today. According to the economic impact study "A Shared Agenda for Growing West Virginia's Agricultural Economy, Prepared by Fourth Economy for West Virginia Department Of Agriculture West Virginia University Extension Service 2012," Jefferson County is the second highest producing county for crops sales, third highest for fruits and vegetables sales, and in the top 9 counties for sales of animals and animal products.

Agriculture, tourism and the equine industries work synergistically to have an outsized positive impact on the economy in Ranson and Jefferson County as a whole. Agriculture drives tourism by creating agro-tourism opportunities, preserving beautiful open spaces that contribute to the bucolic nature of our county, and providing the locally produced agriculture goods many tourists are look for in our markets and restaurants. Agriculture also supports the equine industry by providing local products like hay and straw, helping maintain pasture land, co-supporting local dual-purpose retail stores, and helping recycle by products. Agriculture helps maintain the way of life that many those who choose to live in Jefferson County enjoy. Industrial manufacturing and industry this zoning will provide for could never achieve these things.

Local agriculture also provides a source of locally produced agricultural goods. It has become apparent with the current pandemic and health emergency. This became a supply chain crisis because as our supply chains have moved to be ever more lean and efficient they lack resiliency

and agility. By having a local source of agricultural goods and food we add resiliency and agility into our own economy and community. The agricultural industry in Jefferson County provides this.

A plethora of scientific studies have shown that a variety of air pollutants produced by the type of industry this zoning change would provide for causes decreased yields of both quantity and quality for several of the crops important to Jefferson County including winter wheat and soybeans. Soybeans and wheat are two of the crops significantly affected and two of the most prevalent crops in Jefferson County. Lower crop yields harm the farms and all the members of the down stream supply chain as well as the consumer.

Recent studies have shown that even small increases in air pollution affect the productivity of agricultural workers. Similar to the reduction in crop yield this will negatively affect the individual workers, businesses, consumers and industry as a whole.

Even more devastating is the possibility of groundwater contamination. The land at the subject location has karst hydrogeology and as such has porous bedrock and severe ground instability problems. The porous bedrock allows rapid diffuse infiltration of surface water into ground water and the severe ground instability problems leads to sinkhole development. Sinkholes provide direct connection of the surface water with the ground water aquifer through point infiltration. In fact, according to a 2012 study by Doctor and Doctor, the subject location and that of Terrapins Neck have the highest sinkhole vulnerability of any sites in Jefferson County. The propensity and easy of diffuse and point infiltration in areas of karst hydrogeology give them very high aquifer vulnerability meaning the aquifer is very vulnerable to contamination. For this reason, this measure has been used for decades by policymakers to set land use regulations.

The WVDEP recognizes development in car karst areas puts water resources high-risk for contamination but also recognizes that this is best protected against true local land use and zoning ordinances. WVDEP's guiding document Stormwater Management Design in Karst Areas states, "it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." This document also references the Chesapeake Bay Stormwater Network karst stormwater guidance document the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed. In which it states "...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." Land use policy in Ranson and zoning need to take aquifer vulnerability into consideration as these agencies and documents suggest.

The Jefferson Orchards Voluntary Remediation Plan application reports that the ground water is only 60 feet from the surface at the site. It is described in the scientific literature that this

land is an upland plane with large amounts of water in the epikarst, and contamination of this water effects the whole aquifer including the communications with surface water streams. A USGS study demonstrated that the groundwater adjacent to the site communicates readily with several surface water structures and wells miles away from the site. The effects of contamination at this site would go well beyond Ranson fouling large portions of the ground water and surface water in Jefferson County.

Groundwater contamination at the site would have devastating effects on the Agricultural industry in Jefferson county. For geographic and economic reasons it is simply infeasible for the agricultural industry to rely on utility provided water. Based on the scientific literature the site being considered for rezoning is one of the areas of highest aquifer vulnerability in Jefferson County and is inappropriate for the industry that this zoning change will provide for.

The industry that this zoning will provide for will threaten the health, safety, and welfare of the community by threatening the agriculture industry's ability to produce. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Jennifer King

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would negatively affect tourism, economic agility, groundwater quality, and individual health in neighboring municipalities like Shepherdstown.

Tourism is critically important to Shepherdstown's economy and to the county as a whole. In 2018, tourist spending in the Jefferson County contributed over \$170 million to state and local government revenue and \$213 million in individual earnings. Importantly, most of this money comes from tourists visiting from neighboring states like Virginia, Maryland, and Washington D.C. Out-of-state tourists are largely drawn to Jefferson County because of its reputation for environmental-friendly, sustainable industry. Key elements that support this reputation include the county's pastoral scenery and pristine natural resources. Ordinance #2017-302 will allow industry into Jefferson County that risks harming these elements and dramatically reducing the area's appeal to visitors. The resulting harm to our tourist industry would drive away visitors and decrease state, county, and local revenue. The long-term success of Jefferson County's tourism industry is dependent on local governments making coordinated zoning decisions. Allowing certain types in industry in Ranson will negatively affect tourism in every municipality throughout the county, including Shepherdstown. Voting no on ordinance #2017-302 will protect the foundations of the county's tourism industry and protect the 7,040 jobs in Jefferson County that are directly supported by tourism.

The type of large, consolidated industry that ordinance #2017-302 would allow in Ranson would generally reduce the flexibility of local economies in Jefferson County. Historically, the driving industries in Jefferson County have been tourism, agriculture, and the equine industries. These three industries are large conglomerates of small businesses. Small business is very important to Sheherdstown. Small businesses have been shown to create more jobs, cultivate more innovation, and provide more opportunities than big, non-local firms. Additionally, small businesses have been shown to more reactive to sudden changes relative to manufacturing

businesses. Bringing large, manufacturing-based industry into Jefferson county will depress the local economy and stifle innovation. During this time of economic upheaval and uncertainty, Jefferson County needs to support industries that will allow local economies to adapt and recover as fast as possible.

Voting no on ordinance #2017-302 will help protect water resources throughout Jefferson County. The type of industry that ordinance #2017-302 would allow puts the ground resources of Jefferson county at significant risk due to the karst hydrogeology. The site in Ranson is in the Rocky Marsh Run watershed, which is in the source water protection zone for Shepherdstown and drains to the Potomac River. Therefore, activity at this site will affect both groundwater and surface water streams. In municipalities like Shepherdstown, many residents and nearby farms depend on wells for water. Contamination of groundwater aquifers would create both health and remediation concerns for local residents. Dye tests performed by the USGS near the area of proposed rezoning in Ranson have shown just how far-reaching groundwater contamination at the Ranson site could be. Results from the USGS study revealed measurable dye concentrations in Elk's Run, Rattlesnake Run, and even the Shepherdstown Town Run. This last run cuts through the center of Shepherdstown and is a favorite area for children to play and learn to fish.

Groundwater pollution is not the only concern for communities like Shepherdstown. The type of industry that ordinance #2017-302 would allow in Ranson would also generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. These pollutants are particularly harmful to children. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. The site in Ranson is across the road from an elementary school and also within the Jefferson High Middle district. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of children in Shepherdstown and all of Jefferson County.

I again request that you vote no on ordinance #2017-302. The long-term economic, environmental, and community health of municipalities like Shepherdstown depend on Ranson's participation in a coordinated zoning plan for all of Jefferson County.

Sincerely,

Rosemary Nickerson

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,
A very concerned citizen and mother of 3 children.

Nicole Heim

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask you to vote NO on Ordinance #2017-302. The industry this zoning change will allow for endangers the health, safety and, welfare of the community, and violates the premise of the smart code zoning that we have spent so much time, effort and federal money employing.

Any change in zoning needs to align with the comprehensive plan. In Ranson's current comprehensive plan (2012), the city only refers to "heavy industry" in the history section. Here it is characterized as part of a bygone era that has been replaced by an emphasis on agriculture for local food production, open spaces, and quality-of-life. In the remainder of the document, the word industry is used loosely to describe businesses including flower shops and shoe stores. Nothing that resembles the industry that this zoning change will provide for is described in the current comprehensive plan of Ranson.

In the land use section of the comprehensive plan, number ten states:

"Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The comprehensive plan clearly states that the city will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community. This change in zoning clearly negatively affects the health, safety, and welfare of the community.

As the zoning is proposed, the industry that this zoning change will allow for will be directly across the street from houses, parks and other small businesses. A densely populated subdivision and an elementary school already exit directly across the street. While these latter

community sections are not in the city limits, the effect of this zoning on them should still be considered just the same as it would be if they were in the city limits.

The industry that this zoning change will provide for will produce particulate, gaseous, and hazardous air emissions. These emissions have been shown to be detrimental to human health at every stage of life from embryo to old age. In utero and childhood exposure are the most damaging with lasting effects being realized through out life, and with maternal exposure the effects can be felt for generations. Multiple organ systems are affected including respiratory, cardiovascular, neurologic, immune, and endocrine causing defects in multiple processes including in utero development, neurodevelopment, immune and tolerance development, and cognitive defects. There are also psychological, social, and economic effects from both perceived and actual air pollution in both children and adults. Many of these effects can be seen even with short-term exposure or exposure that is lower than the levels recommended by the US Environmental Protection Agency and World Health Organization. These consequences are devastating to the individual and depressing to the local community and economy. State law does not allow a school to be built next to industry that this zoning will allow but yet we are contemplating changing the zoning so this industry can build next to a school. This does not make sense. As Ranson residents, we want Ranson to follow the lead of the state and keep polluting industry away from kids. In these ways, this change in zoning will negatively affect the health and welfare of the community.

In addition to the health effects of the air emissions is the threat to groundwater from the industry that this zoning change would allow. The land in question has karst hydrogeology and therefore very high aquifer vulnerability and is not appropriate for this industry. With the type of industry this zoning will provide for, combined with high aquifer vulnerability, the likelihood of groundwater contamination is too high for the community and region to bear. A USGS study demonstrated that contamination in the groundwater adjacent to the site moves relatively quickly and can be found in wells and surface water structures in a variety of locations in the County. In this way, contamination at the site would affect the drinking water of the great majority of Jefferson County residents. Through the surface water connections, the water at the site also affects the water resources of the region.

Aquifer vulnerability has been used by policy makers for decades to set land use regulations. The guiding document, from the WVDEP, Stormwater Management Design in Karst Areas states, "it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." In Ranson, we need to follow this advice and not change the zoning of this land for use by industry that has among the highest aquifer vulnerability in the County. This zoning change will endanger the safety of the community and region by endangering the safe water resources. As Ranson residents, we want to safeguard the water resources of the county and region by following the WVDEP guidance here.

Further, by reallocating this transect district and replacing it with a monolithic block of Special District Industrial designation, hundreds of housing units, parks and space for small businesses are lost. Ranson loses the potential for property tax on these properties and their improvements, Business and Occupational tax on the businesses and sales tax in retail stores. The community loses out on the opportunity to develop affordable housing and create locations where people can live, work, play, and shop all in the same place reducing the need for travel.

Worse yet apparently a deal has been made where the entity that owns the subject land has required that a litany of things not be built on the adjacent land essentially stripping the purpose of the smart code transect zone that exists there. Transect zones in the smart code are meant to transition, from out to in, and provide communities where people can safely work and live in close proximity in an effort to reduce travel. Excluding many of the components of the transect zone effectively eliminates the features that make it a transect zone, thus, losing the benefits a transect zone offers the community and city. By losing these benefits, reducing the overall and affordable housing prospects, and reducing so drastically the opportunities for city income, this zoning change will negatively affect the welfare of the community.

As Ranson residents, we find it odd that we are changing zoning to provide for industry that we would not put in the middle of our town close to our residents, but we are placing it close to the homes of county residents. Further, it is striking that the area where this change in zoning is directly adjacent to historically underserved lower income communities and a Title I school. This amounts to environmental injustice and cannot be tolerated.

The purpose of zoning is for a city to protect the health, welfare, morals and safety of the community. In this case, the air emissions and heavy truck traffic will endanger the communities' health. The threat of water contamination will endanger the safety of the community. The effect of lost productivity and decreased workforce participation due to increased illness and the negative effect the air emissions and presence of such a factory will have on the local economy will negatively affect the welfare of the community. The environmental injustice of changing the zoning to accommodate such polluting industry in a location where your municipality has no residents, but yet hundreds of low income and underserved county residents live is egregiously amoral. This must not happen. We respectfully implore you to do the right thing and vote no on ordinance #2017-302.

Sincerely,

Dawn Wilkes
Ranson, 25438

My son and I live in the town of Ranson. Please don't let our future lives here be ruined by the factory! We cannot afford to move, and shouldn't have to. Help us keep this town and all surrounded areas clean and safe! Please!

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote NO on Ordinance #2017-302. This rezoning will put an undue hardship on protection of surface water in Charles Town, risking the health, safety and welfare of the community.

The nature of the industry that this zoning will allow will be harmful to our local economy. Charles Town has spent a lot of time and money improving our downtown area for restaurants and retail. We are working to take advantage of the tourism industry in our county and bring more people into Charles Town. The eye sore, noise pollution, air pollution, and obvious move away from sustainability will drive people away from Jefferson County and Charles Town, rendering our efforts ineffective and unrewarding. This will make it harder for our small businesses to be successful.

According to the 2018 WVU economic study of the eastern panhandle, over 40% of the workforce in Jefferson County choose to work outside of the state. These commuters bring that money home and spend it here supporting our local small businesses, economy and government. Charles Town has a large number of residents who commute. These typically higher earners may choose to leave the area because of the presence of the industry that this zoning change would provide for. This will cause a hardship on our economy and municipality.

The industry that this zoning will allow will cause stress for multiple reasons on the Charles Town wastewater treatment systems and the surface waterways in Jefferson County and beyond. The industry currently planning to utilize the zoning change will have discharge to the wastewater system that is high in chloride, primarily from its water softening system. The NPDES permit modification allows up to 5,000 mg/L. Chloride is not settled or removed at the wastewater treatment plant. It cannot be removed by conventional means and would be prohibitively expensive to do by new technology. This is of concern to Charles Town because chloride can harm stream water and also impair functioning of the wastewater treatment plant.

Furthermore, the corrosive nature of chloride can cause damage to pipes both in the wastewater system and those used by downstream drinking water systems, like the \$207 million Trap Rock Water Treatment plant in Loudoun.

The human health criteria for chloride under WV standards is 250 mg/L. Under low stream flow conditions, chloride additions to the treatment plant effluent, as proposed by the industry currently planning to utilize the zoning change, could cause chloride levels in Evitts Run to exceed this standard. If the amount of chloride increased due to expansion or higher throughput, then this human health standard would be violated frequently. Chlorides are also known to harm aquatic life and effect metal toxicity in rivers. The USEPA and several states have surface water guidelines of 230mg/L for chronic exposure. This would also pose a risk of damaging the water treatment facilities downstream on the Potomac River.

A research study by Lefebvre and Moletta in 2006 showed that chloride and salinity impair the ability of wastewater treatment to remove phosphorus and nitrogen, and because of this, other states have introduced legislation to treat saline wastewater. Uygur and Kargi in 2004 looked at the effects of salt on synthetic wastewater treatment. They found that removal of both nitrogen and phosphorus was reduced when salinity increased from 0 to 6%. In fact, the removal efficiency of ammonia dropped from 96% to 39% with this increasing salinity. Hong et al. In 2016 found phosphorous removal decreased 20-28% when chloride concentrations went from 150 mg/L to 1,500 mg/L. Phosphorous removal was completely inhibited at concentrations greater than 2,500 mg/L. This increased salinity has the potential to make the Charles Town wastewater treatment system work far less efficiently.

In addition to the contents of the wastewater this type of industry will produce, the volume of sewage is itself a concern. Given that the City of Charles Town has been in violation of its permit on numerous occasions for spills and overflow of untreated sewage, adding large volumes of wastewater will further challenge the near capacity system. This will mean that costly capacity upgrades will need to be done likely sooner than they would have needed to be done, imposing further financial strain on the system.

This zoning change will provide for industry the likes of which are not present in this county and have not been present in this county for many decades. We find it appalling that the introduction of zoning for such industry is being done in an area of the county that is historically underserved and lower income. It is even more egregious because the worst effects including air pollution and groundwater contamination will be felt first and most severely in the immediate vicinity, and Ranson does not even have residents in the immediate vicinity of the proposed zoning change. This decision is being contemplated without representation of those who will be most affected. This would be a deplorable example of environmental injustice.

This zoning will provide for industry that will harm our economy, drive away residents, challenge and or damage our infrastructure, and may damage our waterways and wild life. This is being done with out representation of those it will affect the most. Please vote NO on Ordinance #2017-302.

Sincerely,

Rochelle LaRue

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would negatively affect tourism, economic agility, groundwater quality, and individual health in neighboring municipalities like Shepherdstown.

Tourism is critically important to Shepherdstown's economy and to the county as a whole. In 2018, tourist spending in the Jefferson County contributed over \$170 million to state and local government revenue and \$213 million in individual earnings. Importantly, most of this money comes from tourists visiting from neighboring states like Virginia, Maryland, and Washington D.C. Out-of-state tourists are largely drawn to Jefferson County because of its reputation for environmental-friendly, sustainable industry. Key elements that support this reputation include the county's pastoral scenery and pristine natural resources. Ordinance #2017-302 will allow industry into Jefferson County that risks harming these elements and dramatically reducing the area's appeal to visitors. The resulting harm to our tourist industry would drive away visitors and decrease state, county, and local revenue. The long-term success of Jefferson County's tourism industry is dependent on local governments making coordinated zoning decisions. Allowing certain types in industry in Ranson will negatively affect tourism in every municipality throughout the county, including Shepherdstown. Voting no on ordinance #2017-302 will protect the foundations of the county's tourism industry and protect the 7,040 jobs in Jefferson County that are directly supported by tourism.

The type of large, consolidated industry that ordinance #2017-302 would allow in Ranson would generally reduce the flexibility of local economies in Jefferson County. Historically, the driving industries in Jefferson County have been tourism, agriculture, and the equine industries. These three industries are large conglomerates of small businesses. Small business is very important to Sheherdstown. Small businesses have been shown to create more jobs, cultivate more innovation, and provide more opportunities than big, non-local firms. Additionally, small businesses have been shown to more reactive to sudden changes relative to manufacturing

businesses. Bringing large, manufacturing-based industry into Jefferson county will depress the local economy and stifle innovation. During this time of economic upheaval and uncertainty, Jefferson County needs to support industries that will allow local economies to adapt and recover as fast as possible.

Voting no on ordinance #2017-302 will help protect water resources throughout Jefferson County. The type of industry that ordinance #2017-302 would allow puts the ground resources of Jefferson county at significant risk due to the karst hydrogeology. The site in Ranson is in the Rocky Marsh Run watershed, which is in the source water protection zone for Shepherdstown and drains to the Potomac River. Therefore, activity at this site will affect both groundwater and surface water streams. In municipalities like Shepherdstown, many residents and nearby farms depend on wells for water. Contamination of groundwater aquifers would create both health and remediation concerns for local residents. Dye tests performed by the USGS near the area of proposed rezoning in Ranson have shown just how far-reaching groundwater contamination at the Ranson site could be. Results from the USGS study revealed measurable dye concentrations in Elk's Run, Rattlesnake Run, and even the Shepherdstown Town Run. This last run cuts through the center of Shepherdstown and is a favorite area for children to play and learn to fish.

Groundwater pollution is not the only concern for communities like Shepherdstown. The type of industry that ordinance #2017-302 would allow in Ranson would also generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. These pollutants are particularly harmful to children. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. The site in Ranson is across the road from an elementary school and also within the Jefferson High Middle district. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of children in Shepherdstown and all of Jefferson County.

I again request that you vote no on ordinance #2017-302. The long-term economic, environmental, and community health of municipalities like Shepherdstown depend on Ranson's participation in a coordinated zoning plan for all of Jefferson County.

Sincerely,

Susan McGraw

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on #2017-302. The air emissions, possibility of ground and surface water contamination, and their effect on our interwoven economies threaten the health, safety and welfare of not just Jefferson County but the greater region, including Loudoun and the greater Northern Virginia area.

This zoning would provide for industry that produces large amounts of air emissions. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. Northern Virginia is directly downwind from these emissions. Much of the gaseous, fine particulate, and hazardous emissions can reach Northern Virginia. Further affecting the outdoor air quality of the adjacent portion of Virginia and the ability of these areas to achieve and maintain National Ambient Air Quality Standards (NAAQS) attainment. This will affect agriculture and outdoor leisure and recreation.

For example, Loudoun County has been in nonattainment for the NAAQS 8-hour Ozone standard for the past two years. VOC and NO_x react after they have been emitted to produce ground level ozone. The industry that this rezoning would provide for would produce large amounts of these emissions. This would make it even harder as Loudoun County tries to achieve attainment. As time goes on and the scientific research advances our knowledge and understanding of the extent to which gaseous, particulate and hazardous emissions affect human health the NAAQS standards are likely to be reduced. The effects on air emission from this rezoning will make it only harder for Loudoun and Northern Virginia to meet these standards.

In addition to the concerns about the air, the possible ground and surface water contamination is very concerning to Loudoun and Virginia residents. The site is known to have ground water that is vulnerable to contamination due to the karst hydrogeology. A USGS study demonstrated that the ground water adjacent to the site to be rezoned communicates readily with surface

water tributaries of the Potomac River. In addition to direct infiltration where water moves directly from the surface to groundwater via porous limestone bedrock, karst is known to have severe ground instability problems. This makes karst geology prone to sinkhole development. Sinkholes provide direct connection between the surface water and any contaminants it may contain and the groundwater. This makes the aquifer vulnerability in karst areas very high, and contamination with industrial activity such as that provided for by this rezoning too likely.

Loudoun sources its drinking water from the Potomac River, downstream of many West Virginia tributaries that carry water from the epikarst and groundwater aquifer at the site to be rezoned. Loudoun has recently completed the new Trap Rock Water Treatment facility, which draws water from the Potomac River. Loudoun currently provides 40 million gallons and projects to provide 90 million gallons of drinking water a day to customers by 2040 (Loudounwater.org). Therefore, the viability of the Potomac River is a high priority for Virginia residents.

Loudoun and Northern Virginia is one of the fastest growing communities in the country and provides a lot to Jefferson County in their symbiotic relationship. Virginia residents support and enjoy Jefferson County through tourism, as our residents enjoy the natural and historical resources of your county. Virginia residents and businesses support the equine industry in a multitude of ways from providing wagering fans at the races to the Virginia Breeders Association Virginia Certified incentive programs and a strong market for retired racehorses. According to an economic impact study from WVU, at least 40% of Jefferson County residents travel outside of West Virginia for work, a good percentage of those travel to northern Virginia. This rezoning would allow for industry that would negatively affect the economy of both places and this relationship and the benefits for our residents gleaned from it.

This zoning change will provide for industry that will negatively effect the health safety and welfare of the Loudon and Northern Virginia community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Mary Thornton

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on Ordinance #2017-302. Ranson's proposed zoning change presents a significant risk to the equine industry in Jefferson County and well beyond. The type of industry that would be allowed by the proposed zoning change in this location would jeopardize horse health, the groundwater supply, and workforce productivity. This will cause immediate shrinkage and threaten the long-term viability of the equine industry in the county.

The site of the proposed rezoning is less than six miles from Charles Town Races, with several breeding, training, and rehabilitation facilities between the two. The industry allowed by this rezoning would produce particulate, gaseous, and hazardous air emissions that would reach these sites. According to the WVDEP air permit, the Rockwool plant in Ranson is permitted to emit 250.87 tons of particulate matter per year into the air (1).

According to a recent study published in the journal of Veterinary Internal Medicine (2), horses are 15 times more sensitive to inhaled particulate matter than humans. Inhaled particulate matter can cause inflammation in horses' lungs that negatively affects performance. Inhaled particulate matter also contributes to the development of inflammatory airway disease (IAD) (3). IAD is a chronic airway disease that can affect horses long after their racing career is over. While there is little research on how other air pollutants affect horses, the effects of pollution on humans can be used to infer potential impact on horses. However unlike human models, these horses are elite athletes continuously exposed, and will thus likely experience detrimental effects at much lower levels of air pollution than humans.

The primary concern with air pollution is that increased levels of pollutants will increase inflammation in horses' lungs. Even small, subclinical amounts of inflammation in the lungs of horses negatively affect performance (2,3,4,5,6,11). This inflammation can also cause increased recovery times following racing (7,11). Reduced performance and training interruptions can lead to higher risk of injury, reduced winning average, fewer yearly starts, lower yearly

earnings, shortened career length, fewer lifetime starts, reduced lifetime earnings, and reduced quality of life (2,3,8,9,11). Each of these situations will lead to decreased return on investment, decreased cash flow, and decreased overall earnings for owners, trainers, and breeders with horses at Charles Town Races and in nearby areas.

While racing is usually a thoroughbred's first career, it is rarely their last. Some racing horses go on to be breeding stock, while others will have successful careers as sport horses. Jefferson County is an important source of new stock for sport horse trainers from Northern Virginia, and Maryland, and this is a resource for local horseman of both income and placement for horses not appropriate for breeding. However, if retired racehorses are unsound from injury or respiratory disease, they can be difficult to manage as breeding stock or unfit for a career as a sport horse. This affects the horse's quality of life and also places a burden on the industry locally and regionally.

The perception of decreased air quality from the increase in regional haze and visible smokestacks as one drives into the county will deter out of state owners and breeders from investing in West Virginia bred Race horses, decreasing or eliminating a critical \$50 million a year source of local business volume.

Another concern related to the proposed rezoning in Ranson is the risk of groundwater contamination as a result of the karst hydrogeology at the site and the industrial activity. Horsemen will either have to take on the expense of periodically testing water sources or they may not know local ground water is contaminated until their animals are sick. Veterinary care and testing adds expense and uncertainty to an industry that already deals with large inherent risks. The actual occurrence of ground water contamination would be devastating for Jefferson County's equine industry. For both geographic and financial reasons, it is simply impossible to think that the industry could solely use public or private utility-provided water if industrial activity fouled the local groundwater.

Finally, studies on US agricultural workers have demonstrated that increased air pollution decreases productivity of outdoors workers. This would place an additional burden on workers, small business owners and the industry.

The equine industry in Jefferson County is hundreds of years old. It is not worth risking this historic and economically valuable industry by rezoning for industrial companies like Rockwool. An economic impact study of the Charles Town Thoroughbred Horse Racing Industry on Jefferson County's economy found that the spending by owners, breeders, and trainers of the equine industry directly contributes \$79.4 million to the county each year. Out-of-state owners, breeders, and trainers spend more than \$50 million in Jefferson County every year. The value of total business volume in Jefferson County is \$191 million each year (10). These numbers do not include the effect of the handle or the casino.

The equine industry provides jobs for a broad cross-section of the public. This industry offers individuals of any educational background a variety of paths to achieve a good middle-income

living. Many jobs allow individuals to pursue apprenticeships or on-the-job training rather than requiring a costly college education. This flexibility allows for greater lifetime earnings and improved educational debt-to-earnings ratio for these workers. The equine industry also provides opportunities for non-traditional workers by offering job opportunities to those who may not be employable by larger corporations. This industry provides a variety of full-time, part-time, flexible, and pick-up work. Encouraging this type of flexible job ecosystem helps create a healthy economy with broad participation in employment and consumption.

The equine industry is a large conglomerate of small businesses, which have a multitude of economic benefits over having a few large businesses. It has been extensively reported that small locally owned businesses and start ups create more jobs, cultivate innovation, generate higher incomes, and provide more opportunities for individuals that would otherwise not exist than big non-local firms, which can actually depress local economies. The equine industry provides opportunities for small businesses and startups responsible for this growth of better jobs that are so good for the economy.

The equine industry offers so many other benefits that the industry in the rezoned area would not. For example, the equine industry supports local agriculture by providing a market for agricultural goods such as straw. The robust straw market supported by owners, trainers, and breeders allows for a third cash crop to be produced from one field in a year. Through pastureland and support of local agricultural goods, the equine industry protects and preserves the open spaces that give our county its bucolic quality and help attract tourists. Through the breeders' incentive programs, the equine industry offers unique opportunities to draft state funds back to Jefferson County, to name a few.

Rezoning this area of Ranson for Special District Industrial will allow in entities whose activities are harmful to the equine industry. The losses incurred by the equine industry would far outweigh any benefits derived from industries occupying the rezoned area. Sacrificing the long-term viability of one of our oldest and most productive industries for a net loss in business volume and economic value just does not make good sense for the local economy. Please vote NO on Ordinance #2017-302.

Sincerely,

Ellen Murphy

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The city has failed to address the latter part of this objective. By Changing the SDI in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and child hood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health, and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and overall earnings for owners, breeders, and

trainers. This group provides over 70 million dollars in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. This industry would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitorship and again decreasing return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up this industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the Karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive plan is clear the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Susan Winters

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The city has failed to address the latter part of this objective. By Changing the SDI in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and child hood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health, and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and overall earnings for owners, breeders, and

trainers. This group provides over 70 million dollars in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. This industry would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitorship and again decreasing return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up this industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the Karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive plan is clear the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote NO on Ordinance #2017-302. This rezoning will put an undue hardship on protection of surface water in Charles Town, risking the health, safety and welfare of the community.

The nature of the industry that this zoning will allow will be harmful to our local economy. Charles Town has spent a lot of time and money improving our downtown area for restaurants and retail. We are working to take advantage of the tourism industry in our county and bring more people into Charles Town. The eye sore, noise pollution, air pollution, and obvious move away from sustainability will drive people away from Jefferson County and Charles Town, rendering our efforts ineffective and unrewarding. This will make it harder for our small businesses to be successful.

According to the 2018 WVU economic study of the eastern panhandle, over 40% of the workforce in Jefferson County choose to work outside of the state. These commuters bring that money home and spend it here supporting our local small businesses, economy and government. Charles Town has a large number of residents who commute. These typically higher earners may choose to leave the area because of the presence of the industry that this zoning change would provide for. This will cause a hardship on our economy and municipality.

The industry that this zoning will allow will cause stress for multiple reasons on the Charles Town wastewater treatment systems and the surface waterways in Jefferson County and beyond. The industry currently planning to utilize the zoning change will have discharge to the wastewater system that is high in chloride, primarily from its water softening system. The NPDES permit modification allows up to 5,000 mg/L. Chloride is not settled or removed at the wastewater treatment plant. It cannot be removed by conventional means and would be prohibitively expensive to do by new technology. This is of concern to Charles Town because chloride can harm stream water and also impair functioning of the wastewater treatment plant.

Furthermore, the corrosive nature of chloride can cause damage to pipes both in the wastewater system and those used by downstream drinking water systems, like the \$207 million Trap Rock Water Treatment plant in Loudoun.

The human health criteria for chloride under WV standards is 250 mg/L. Under low stream flow conditions, chloride additions to the treatment plant effluent, as proposed by the industry currently planning to utilize the zoning change, could cause chloride levels in Evitts Run to exceed this standard. If the amount of chloride increased due to expansion or higher throughput, then this human health standard would be violated frequently. Chlorides are also known to harm aquatic life and effect metal toxicity in rivers. The USEPA and several states have surface water guidelines of 230mg/L for chronic exposure. This would also pose a risk of damaging the water treatment facilities downstream on the Potomac River.

A research study by Lefebvre and Moletta in 2006 showed that chloride and salinity impair the ability of wastewater treatment to remove phosphorus and nitrogen, and because of this, other states have introduced legislation to treat saline wastewater. Uygur and Kargi in 2004 looked at the effects of salt on synthetic wastewater treatment. They found that removal of both nitrogen and phosphorus was reduced when salinity increased from 0 to 6%. In fact, the removal efficiency of ammonia dropped from 96% to 39% with this increasing salinity. Hong et al. In 2016 found phosphorous removal decreased 20-28% when chloride concentrations went from 150 mg/L to 1,500 mg/L. Phosphorous removal was completely inhibited at concentrations greater than 2,500 mg/L. This increased salinity has the potential to make the Charles Town wastewater treatment system work far less efficiently.

In addition to the contents of the wastewater this type of industry will produce, the volume of sewage is itself a concern. Given that the City of Charles Town has been in violation of its permit on numerous occasions for spills and overflow of untreated sewage, adding large volumes of wastewater will further challenge the near capacity system. This will mean that costly capacity upgrades will need to be done likely sooner than they would have needed to be done, imposing further financial strain on the system.

This zoning change will provide for industry the likes of which are not present in this county and have not been present in this county for many decades. We find it appalling that the introduction of zoning for such industry is being done in an area of the county that is historically underserved and lower income. It is even more egregious because the worst effects including air pollution and groundwater contamination will be felt first and most severely in the immediate vicinity, and Ranson does not even have residents in the immediate vicinity of the proposed zoning change. This decision is being contemplated without representation of those who will be most affected. This would be a deplorable example of environmental injustice.

This zoning will provide for industry that will harm our economy, drive away residents, challenge and or damage our infrastructure, and may damage our waterways and wild life. This is being done with out representation of those it will affect the most. Please vote NO on Ordinance #2017-302.

Sincerely,

Michael Bucci

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on Ordinance #2017-302. Ranson's proposed zoning change presents a significant risk to the equine industry in Jefferson County and well beyond. The type of industry that would be allowed by the proposed zoning change in this location would jeopardize horse health, the groundwater supply, and workforce productivity. This will cause immediate shrinkage and threaten the long-term viability of the equine industry in the county.

The site of the proposed rezoning is less than six miles from Charles Town Races, with several breeding, training, and rehabilitation facilities between the two. The industry allowed by this rezoning would produce particulate, gaseous, and hazardous air emissions that would reach these sites. According to the WVDEP air permit, the Rockwool plant in Ranson is permitted to emit 250.87 tons of particulate matter per year into the air (1).

According to a recent study published in the journal of Veterinary Internal Medicine (2), horses are 15 times more sensitive to inhaled particulate matter than humans. Inhaled particulate matter can cause inflammation in horses' lungs that negatively affects performance. Inhaled particulate matter also contributes to the development of inflammatory airway disease (IAD) (3). IAD is a chronic airway disease that can affect horses long after their racing career is over. While there is little research on how other air pollutants affect horses, the effects of pollution on humans can be used to infer potential impact on horses. However unlike human models, these horses are elite athletes continuously exposed, and will thus likely experience detrimental effects at much lower levels of air pollution than humans.

The primary concern with air pollution is that increased levels of pollutants will increase inflammation in horses' lungs. Even small, subclinical amounts of inflammation in the lungs of horses negatively affect performance (2,3,4,5,6,11). This inflammation can also cause increased recovery times following racing (7,11). Reduced performance and training interruptions can lead to higher risk of injury, reduced winning average, fewer yearly starts, lower yearly

earnings, shortened career length, fewer lifetime starts, reduced lifetime earnings, and reduced quality of life (2,3,8,9,11). Each of these situations will lead to decreased return on investment, decreased cash flow, and decreased overall earnings for owners, trainers, and breeders with horses at Charles Town Races and in nearby areas.

While racing is usually a thoroughbred's first career, it is rarely their last. Some racing horses go on to be breeding stock, while others will have successful careers as sport horses. Jefferson County is an important source of new stock for sport horse trainers from Northern Virginia, and Maryland, and this is a resource for local horseman of both income and placement for horses not appropriate for breeding. However, if retired racehorses are unsound from injury or respiratory disease, they can be difficult to manage as breeding stock or unfit for a career as a sport horse. This affects the horse's quality of life and also places a burden on the industry locally and regionally.

The perception of decreased air quality from the increase in regional haze and visible smokestacks as one drives into the county will deter out of state owners and breeders from investing in West Virginia bred Race horses, decreasing or eliminating a critical \$50 million a year source of local business volume.

Another concern related to the proposed rezoning in Ranson is the risk of groundwater contamination as a result of the karst hydrogeology at the site and the industrial activity. Horsemen will either have to take on the expense of periodically testing water sources or they may not know local ground water is contaminated until their animals are sick. Veterinary care and testing adds expense and uncertainty to an industry that already deals with large inherent risks. The actual occurrence of ground water contamination would be devastating for Jefferson County's equine industry. For both geographic and financial reasons, it is simply impossible to think that the industry could solely use public or private utility-provided water if industrial activity fouled the local groundwater.

Finally, studies on US agricultural workers have demonstrated that increased air pollution decreases productivity of outdoors workers. This would place an additional burden on workers, small business owners and the industry.

The equine industry in Jefferson County is hundreds of years old. It is not worth risking this historic and economically valuable industry by rezoning for industrial companies like Rockwool. An economic impact study of the Charles Town Thoroughbred Horse Racing Industry on Jefferson County's economy found that the spending by owners, breeders, and trainers of the equine industry directly contributes \$79.4 million to the county each year. Out-of-state owners, breeders, and trainers spend more than \$50 million in Jefferson County every year. The value of total business volume in Jefferson County is \$191 million each year (10). These numbers do not include the effect of the handle or the casino.

The equine industry provides jobs for a broad cross-section of the public. This industry offers individuals of any educational background a variety of paths to achieve a good middle-income

living. Many jobs allow individuals to pursue apprenticeships or on-the-job training rather than requiring a costly college education. This flexibility allows for greater lifetime earnings and improved educational debt-to-earnings ratio for these workers. The equine industry also provides opportunities for non-traditional workers by offering job opportunities to those who may not be employable by larger corporations. This industry provides a variety of full-time, part-time, flexible, and pick-up work. Encouraging this type of flexible job ecosystem helps create a healthy economy with broad participation in employment and consumption.

The equine industry is a large conglomerate of small businesses, which have a multitude of economic benefits over having a few large businesses. It has been extensively reported that small locally owned businesses and start ups create more jobs, cultivate innovation, generate higher incomes, and provide more opportunities for individuals that would otherwise not exist than big non-local firms, which can actually depress local economies. The equine industry provides opportunities for small businesses and startups responsible for this growth of better jobs that are so good for the economy.

The equine industry offers so many other benefits that the industry in the rezoned area would not. For example, the equine industry supports local agriculture by providing a market for agricultural goods such as straw. The robust straw market supported by owners, trainers, and breeders allows for a third cash crop to be produced from one field in a year. Through pastureland and support of local agricultural goods, the equine industry protects and preserves the open spaces that give our county its bucolic quality and help attract tourists. Through the breeders' incentive programs, the equine industry offers unique opportunities to draft state funds back to Jefferson County, to name a few.

Rezoning this area of Ranson for Special District Industrial will allow in entities whose activities are harmful to the equine industry. The losses incurred by the equine industry would far outweigh any benefits derived from industries occupying the rezoned area. Sacrificing the long-term viability of one of our oldest and most productive industries for a net loss in business volume and economic value just does not make good sense for the local economy. Please vote NO on Ordinance #2017-302.

Sincerely,

Christie polen

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that will significantly harm the municipalities within Jefferson County and beyond effecting the health, welfare, and safety of our community. Harpers Ferry is a national treasure with the natural and historic resources tours flock to see each year and one of the communities that will be negatively impacted by this zoning change.

Please keep us who we are! We do not need heavy industry in the panhandle.

According to a 2019 study by the West Virginia Tourism Office, Jefferson County generated an average of \$178 million per year in tourism-derived revenue for state and local governments over the last 10 years, more than any other county in West Virginia by at least double. Tourism benefits the businesses and economy of Ranson and Jefferson County producing \$213.7 million in individual earning, 7040 jobs, and \$842.6 million in direct spending here in 2018. We would need 40 Project Shuttles to replace the individual earnings and 59 Rockwools to replace the jobs provided by the tourism industry in Jefferson County. It is important to note that most of the money generated by tourism in Jefferson County comes from neighboring states. In this way, it is like an export: not simply recycling money, but bringing money into the state increasing its wealth. Much of the economy in Harpers Ferry is based on this tourism industry. A threat to this industry poses a threat to the economy and welfare of our community.

One of the important drivers for tourism in Harpers Ferry is the Appalachian Trail. According to the Appalachian Trail Conservancy (ATC), Harpers Ferry is the psychologic midpoint of the Trail, and hikers often plan extended stays in Jefferson County with an obvious positive impact. The ATC reports that the smokestacks and associated lights will be visible in the viewshed of 15 vistas on the Appalachian Trail (AT). Studies have shown that quality of vistas and human impact on the environment are not only noticed by visitors, but effect their experience. Another study published in the Journal of Applied Recreation Research, found that points of interests and views drew visitors' attention and had a significant impact on their perception of

the trail. It was also found that particularly beautiful vistas helped visitors overlook elements that usually have a negative effect on trail experience like increased trail traffic. A 2009 study in Leisure Sciences revealed that scenic value was a perceptual theme of Appalachian Trail visitors, and that things as simple as dead trees visible in a vista can have a negative impact on visitors' overall perception. Imagine the effect the smokestacks will have from the 15 vistas from which they will be visible. The introduction of industrial activity made possible by the proposed rezoning in Ranson would have a negative effect on the scenic views of beautiful landscapes from the Appalachian Trail in Jefferson County.

The smokestacks are not all visitors will be able to see — the air pollution will create haze. The effect of regional haze on tourists was explored in a review article published in the Atmospheric Environment titled "Impaired visibility: the air pollution people see." A key takeaway on the negative affect of haze on vacationing tourists was summarized as follows:

"Vacations offer an escape from the routine and stress of our daily lives. Vacation destinations are often chosen based on their scenery; vacations are spent gazing at monuments, mountains, clouds, and oceans. Good visibility allows clear observation of distant features and appreciation of the inherent beauty of these scenes...Air pollution, which is often present in both our cities and parks, interferes with these attributes and can ruin the views vacationers travel to enjoy."

People seek bucolic, unspoiled areas to escape the stresses of urban areas. A 2004 study in Environment and Behavior found perceived pollution causes stress while viewing natural scenes has both psychological and physiological benefits, and a 2007 study confirmed these benefits. Two other studies found that people are emotionally affected by poor visibility, and tourists are disappointed when views are obscured by haze.

The combination of smokestacks and haze will mar the viewshed and will not only reduce the positive effects of a scenic landscape but also leave tourists disappointed and dissatisfied with their choice of destination. With these effects the welfare of the Harpers Ferry community would undoubtedly be endangered by the industry that this zoning change will provide for.

Multiple studies by doctors Kozar, Doctor, and Doctor have demonstrated that the land at this site to be rezoned is Karst with the highest likelihood of sinkhole development in the county, and that the groundwater aquifer there is incredibly sensitive to contamination from surface water. Further, this site is on an upland plain with relatively few surface streams, seasonal variability in the water table that results in numerous estavelles, and large amounts of water in the epikarst. In this area contamination in surface water communicates easily to the water in the epikarst via diffuse and point infiltration, and the springs at the margins of the upland area are directly affected by the water quality throughout the aquifer. According to Jefferson Orchards Voluntary Remediation Plan with the WVDEP, the groundwater at the site is approximately 60 feet below the ground, and the tests performed by the USGS have shown that groundwater from just adjacent to this site emerged in the headwaters of both the Elk's Run and Rattlesnake Run. This is critically important for Harpers Ferry because the Elk's Run headwaters is a spring about three miles southeast of the site and goes on to become the

drinking water source for Harpers Ferry and Bolivar before emptying into the Potomac River. The headwaters of Rattlesnake Run is a spring about 3.5 miles from the site and is also a tributary of the Potomac River. The Potomac River is the back up water source for Harpers Ferry. This means that the activity at the site will have a critical influence on the drinking water of Harpers Ferry. In this was the industry permitted by this change in zoning would undoubtedly endanger the health and safety of the community in Harpers Ferry.

The untoward health effects and individual economic consequences from the pollution emissions of the industry this rezoning will allow that will be born out over the length of people's lives and that of their decedents for at least three generations is an egregious example of environmental injustice that should not be tolerated. This zoning change may be in one of the poorest sections of the county, but the effects will be felt in every part of Ranson and the county.

The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." The industry that this rezoning will allow will jeopardize the health, safety and welfare of Ranson, Harpers Ferry and the whole county. Please vote no on the ordinance #2017-302.

Sincerely,

Theodora Cullum

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that will significantly harm the municipalities within Jefferson County and beyond effecting the health, welfare, and safety of our community. Harpers Ferry is a national treasure with the natural and historic resources tours flock to see each year and one of the communities that will be negatively impacted by this zoning change.

According to a 2019 study by the West Virginia Tourism Office, Jefferson County generated and average of \$178 million per year in tourism-derived revenue for state and local governments over the last 10 years, more than any other county in West Virginia by at least double. Tourism benefits the businesses and economy of Ranson and Jefferson County producing \$213.7 million in individual earning, 7040 jobs, and \$842.6 million in direct spending here in 2018. We would need 40 Project Shuttles to replace the individual earnings and 59 Rockwools to replace the jobs provided by the tourism industry in Jefferson County. It is important to note that most of the money generated by tourism in Jefferson County comes from neighboring states. In this way it is like an export. Not simply recycling money but bringing money into the state increasing its wealth. Much of the economy in Harpers Ferry is based on this tourism industry. A threat to this industry poses a threat to the economy and welfare of our community.

One of the important drivers for tourism in Harpers Ferry is the Appalachian Trail. According to the Appalachian Trail Conservancy (ATC), Harpers Ferry is the psychologic midpoint of the Trail, and Hikers often plan extended stays in Jefferson County with an obvious positive impact. The ATC reports that the smokestacks and associated lights will be visible in the view shed of 15 vistas on the Appalachian Trail (AT). Studies have shown that quality of vistas and human impact on the environment are not only noticed by visitors but effect their experience. Another study published in the Journal of Applied Recreation Research, found that points of interests and views drew visitors' attention and had a significant impact on their perception of the trail. It was also found that particularly beautiful vistas helped visitors overlook elements that usually

have a negative effect on trail experience like increased trail traffic. A 2009 study in Leisure Sciences revealed that scenic value was a perceptual theme of Appalachian Trail visitors, and that things as simple as dead trees visible in a vista can have a negative impact on visitors overall perception. Imagine the effect the smokestacks will have from the 15 vistas from which they will be visible. The introduction of industrial activity made possible by the proposed rezoning in Ranson would have a negative effect on the scenic views of beautiful landscapes from the Appalachian Trail in Jefferson County.

The smokestacks are not all visitors will be able to see, the air pollution will create haze. The effect of regional haze on tourists was explored in a review article published in the *Atmospheric Environment* titled "Impaired visibility: the air pollution people see." A key takeaway on the negative affect of haze on vacationing tourists was summarized as follows: "Vacations offer an escape from the routine and stress of our daily lives. Vacation destinations are often chosen based on their scenery; vacations are spent gazing at monuments, mountains, clouds, and oceans. Good visibility allows clear observation of distant features and appreciation of the inherent beauty of these scenes...Air pollution, which is often present in both our cities and parks, interferes with these attributes and can ruin the views vacationers travel to enjoy." People seek bucolic, unspoiled areas to escape the stresses of urban areas. A 2004 study in *Environment and Behavior* found Perceived pollution causes stress while viewing natural scenes has both psychological and physiological benefits, and a 2007 study confirmed these benefits. Two other studies found that people are emotionally affected by poor visibility, and tourists are disappointed when views are obscured by haze. The combination of smokestacks and haze will mar the viewshed and will not only reduce the positive effects of a scenic landscape but also leave tourists disappointed and dissatisfied with their choice of destination. With these effects the welfare of the Harpers Ferry community would undoubtedly be endangered by the industry that this zoning change will provide for.

Multiple studies by doctors Kozar, Doctor, and Doctor have demonstrated that the land at this site to be rezoned is Karst with the highest likelihood of sinkhole development in the county, and that the ground water aquifer there is incredibly sensitive to contamination from surface water. Further, this site is on an upland plain with relatively few surface streams, seasonal variability in the water table that results in numerous estavelles, and large amounts of water in the epikarst. In this area contamination in surface water communicates easily to the water in the epikarst via diffuse and point infiltration, and the springs at the margins of the upland area are directly affected by the water quality throughout the aquifer. According to Jefferson Orchards Voluntary Remediation Plan with the WVDEP, the ground water at the site is approximately 60 feet below the ground, and the tests performed by the USGS have shown that ground water from just adjacent to this site emerged in the headwaters of both the Elk's Run and Rattlesnake Run. This is critically important for Harpers Ferry because the Elk's Run headwaters is a spring about three miles south east of the site and goes on to become the drinking water source for Harpers Ferry and Bolivar before emptying into the Potomac River. The headwaters of Rattlesnake Run is a spring about 3.5 miles from the site and is also a tributary of the Potomac River. The Potomac River is the back up water source for Harpers Ferry. This means that the activity at the site will have a critical influence on the drinking water

of Harpers Ferry. In this was the industry permitted by this change in zoning would undoubtedly endanger the health and safety of the community in Harpers Ferry.

The untoward health effects and individual economic consequences from the pollution emissions of the industry this rezoning will allow that will be born out over the length of peoples lives and that of their decedents for at least 3 generations is an egregious example of environmental injustice that should not be tolerated. This zoning change may be in one of the poorest sections of the county but the effects will be felt in every part of Ranson and the county.

The Comprehensive plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” The industry that this rezoning will allow will jeopardize the health, safety and welfare of Ranson, Harpers Ferry and the whole county. Please vote no on the ordinance #2017-302.

Sincerely,

Teresa Breeden

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would negatively affect tourism, economic agility, groundwater quality, and individual health in neighboring municipalities like Shepherdstown.

Tourism is critically important to Shepherdstown's economy and to the county as a whole. In 2018, tourist spending in the Jefferson County contributed over \$170 million to state and local government revenue and \$213 million in individual earnings. Importantly, most of this money comes from tourists visiting from neighboring states like Virginia, Maryland, and Washington D.C. Out-of-state tourists are largely drawn to Jefferson County because of its reputation for environmental-friendly, sustainable industry. Key elements that support this reputation include the county's pastoral scenery and pristine natural resources. Ordinance #2017-302 will allow industry into Jefferson County that risks harming these elements and dramatically reducing the area's appeal to visitors. The resulting harm to our tourist industry would drive away visitors and decrease state, county, and local revenue. The long-term success of Jefferson County's tourism industry is dependent on local governments making coordinated zoning decisions. Allowing certain types in industry in Ranson will negatively affect tourism in every municipality throughout the county, including Shepherdstown. Voting no on ordinance #2017-302 will protect the foundations of the county's tourism industry and protect the 7,040 jobs in Jefferson County that are directly supported by tourism.

The type of large, consolidated industry that ordinance #2017-302 would allow in Ranson would generally reduce the flexibility of local economies in Jefferson County. Historically, the driving industries in Jefferson County have been tourism, agriculture, and the equine industries. These three industries are large conglomerates of small businesses. Small business is very important to Sheherdstown. Small businesses have been shown to create more jobs, cultivate more innovation, and provide more opportunities than big, non-local firms. Additionally, small businesses have been shown to more reactive to sudden changes relative to manufacturing

businesses. Bringing large, manufacturing-based industry into Jefferson county will depress the local economy and stifle innovation. During this time of economic upheaval and uncertainty, Jefferson County needs to support industries that will allow local economies to adapt and recover as fast as possible.

Voting no on ordinance #2017-302 will help protect water resources throughout Jefferson County. The type of industry that ordinance #2017-302 would allow puts the ground resources of Jefferson county at significant risk due to the karst hydrogeology. The site in Ranson is in the Rocky Marsh Run watershed, which is in the source water protection zone for Shepherdstown and drains to the Potomac River. Therefore, activity at this site will affect both groundwater and surface water streams. In municipalities like Shepherdstown, many residents and nearby farms depend on wells for water. Contamination of groundwater aquifers would create both health and remediation concerns for local residents. Dye tests performed by the USGS near the area of proposed rezoning in Ranson have shown just how far-reaching groundwater contamination at the Ranson site could be. Results from the USGS study revealed measurable dye concentrations in Elk's Run, Rattlesnake Run, and even the Shepherdstown Town Run. This last run cuts through the center of Shepherdstown and is a favorite area for children to play and learn to fish.

Groundwater pollution is not the only concern for communities like Shepherdstown. The type of industry that ordinance #2017-302 would allow in Ranson would also generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. These pollutants are particularly harmful to children. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. The site in Ranson is across the road from an elementary school and also within the Jefferson High Middle district. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of children in Shepherdstown and all of Jefferson County.

I again request that you vote no on ordinance #2017-302. The long-term economic, environmental, and community health of municipalities like Shepherdstown depend on Ranson's participation in a coordinated zoning plan for all of Jefferson County.

Sincerely,

Ellen Jacobs

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

As a longtime resident who cares about the quality of life for the entire county I ask that you please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately

decreasing return on investment, cash flow, and over all earnings for owners, breeders, and trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Phil Alegret

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that will significantly harm the municipalities within Jefferson County and beyond effecting the health, welfare, and safety of our community. Harpers Ferry is a national treasure with the natural and historic resources tours flock to see each year and one of the communities that will be negatively impacted by this zoning change.

According to a 2019 study by the West Virginia Tourism Office, Jefferson County generated and average of \$178 million per year in tourism-derived revenue for state and local governments over the last 10 years, more than any other county in West Virginia by at least double. Tourism benefits the businesses and economy of Ranson and Jefferson County producing \$213.7 million in individual earning, 7040 jobs, and \$842.6 million in direct spending here in 2018. We would need 40 Project Shuttles to replace the individual earnings and 59 Rockwools to replace the jobs provided by the tourism industry in Jefferson County. It is important to note that most of the money generated by tourism in Jefferson County comes from neighboring states. In this way it is like an export. Not simply recycling money but bringing money into the state increasing its wealth. Much of the economy in Harpers Ferry is based on this tourism industry. A threat to this industry poses a threat to the economy and welfare of our community.

One of the important drivers for tourism in Harpers Ferry is the Appalachian Trail. According to the Appalachian Trail Conservancy (ATC), Harpers Ferry is the psychologic midpoint of the Trail, and Hikers often plan extended stays in Jefferson County with an obvious positive impact. The ATC reports that the smokestacks and associated lights will be visible in the view shed of 15 vistas on the Appalachian Trail (AT). Studies have shown that quality of vistas and human impact on the environment are not only noticed by visitors but effect their experience. Another study published in the Journal of Applied Recreation Research, found that points of interests and views drew visitors' attention and had a significant impact on their perception of the trail. It was also found that particularly beautiful vistas helped visitors overlook elements that usually

have a negative effect on trail experience like increased trail traffic. A 2009 study in Leisure Sciences revealed that scenic value was a perceptual theme of Appalachian Trail visitors, and that things as simple as dead trees visible in a vista can have a negative impact on visitors overall perception. Imagine the effect the smokestacks will have from the 15 vistas from which they will be visible. The introduction of industrial activity made possible by the proposed rezoning in Ranson would have a negative effect on the scenic views of beautiful landscapes from the Appalachian Trail in Jefferson County.

The smokestacks are not all visitors will be able to see, the air pollution will create haze. The effect of regional haze on tourists was explored in a review article published in the *Atmospheric Environment* titled "Impaired visibility: the air pollution people see." A key takeaway on the negative affect of haze on vacationing tourists was summarized as follows: "Vacations offer an escape from the routine and stress of our daily lives. Vacation destinations are often chosen based on their scenery; vacations are spent gazing at monuments, mountains, clouds, and oceans. Good visibility allows clear observation of distant features and appreciation of the inherent beauty of these scenes...Air pollution, which is often present in both our cities and parks, interferes with these attributes and can ruin the views vacationers travel to enjoy." People seek bucolic, unspoiled areas to escape the stresses of urban areas. A 2004 study in *Environment and Behavior* found Perceived pollution causes stress while viewing natural scenes has both psychological and physiological benefits, and a 2007 study confirmed these benefits. Two other studies found that people are emotionally affected by poor visibility, and tourists are disappointed when views are obscured by haze. The combination of smokestacks and haze will mar the viewshed and will not only reduce the positive effects of a scenic landscape but also leave tourists disappointed and dissatisfied with their choice of destination. With these effects the welfare of the Harpers Ferry community would undoubtedly be endangered by the industry that this zoning change will provide for.

Multiple studies by doctors Kozar, Doctor, and Doctor have demonstrated that the land at this site to be rezoned is Karst with the highest likelihood of sinkhole development in the county, and that the ground water aquifer there is incredibly sensitive to contamination from surface water. Further, this site is on an upland plain with relatively few surface streams, seasonal variability in the water table that results in numerous estavelles, and large amounts of water in the epikarst. In this area contamination in surface water communicates easily to the water in the epikarst via diffuse and point infiltration, and the springs at the margins of the upland area are directly affected by the water quality throughout the aquifer. According to Jefferson Orchards Voluntary Remediation Plan with the WVDEP, the ground water at the site is approximately 60 feet below the ground, and die tests performed by the USGS have shown that ground water from just adjacent to this site emerged in the headwaters of both the Elk's Run and Rattlesnake Run. This is critically important for Harpers Ferry because the Elk's Run headwaters is a spring about three miles south east of the site and goes on to become the drinking water source for Harpers Ferry and Bolivar before emptying into the Potomac River. The headwaters of Rattlesnake Run is a spring about 3.5 miles from the site and is also a tributary of the Potomac River. The Potomac River is the back up water source for Harpers Ferry. This means that the activity at the site will have a critical influence on the drinking water

of Harpers Ferry. In this was the industry permitted by this change in zoning would undoubtedly endanger the health and safety of the community in Harpers Ferry.

The untoward health effects and individual economic consequences from the pollution emissions of the industry this rezoning will allow that will be born out over the length of peoples lives and that of their decedents for at least 3 generations is an egregious example of environmental injustice that should not be tolerated. This zoning change may be in one of the poorest sections of the county but the effects will be felt in every part of Ranson and the county.

The Comprehensive plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” The industry that this rezoning will allow will jeopardize the health, safety and welfare of Ranson, Harpers Ferry and the whole county. Please vote no on the ordinance #2017-302.

Sincerely,

Mark Drew, Jr.
Harpers Ferry, 25425

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on #2017-302. The air emissions, possibility of ground and surface water contamination, and their effect on our interwoven economies threaten the health, safety and welfare of not just Jefferson County but the greater region, including Loudoun and the greater Northern Virginia area.

This zoning would provide for industry that produces large amounts of air emissions. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. Northern Virginia is directly downwind from these emissions. Much of the gaseous, fine particulate, and hazardous emissions can reach Northern Virginia. Further affecting the outdoor air quality of the adjacent portion of Virginia and the ability of these areas to achieve and maintain National Ambient Air Quality Standards (NAAQS) attainment. This will affect agriculture and outdoor leisure and recreation.

For example, Loudoun County has been in nonattainment for the NAAQS 8-hour Ozone standard for the past two years. VOC and NO_x react after they have been emitted to produce ground level ozone. The industry that this rezoning would provide for would produce large amounts of these emissions. This would make it even harder as Loudoun County tries to achieve attainment. As time goes on and the scientific research advances our knowledge and understanding of the extent to which gaseous, particulate and hazardous emissions affect human health the NAAQS standards are likely to be reduced. The effects on air emission from this rezoning will make it only harder for Loudoun and Northern Virginia to meet these standards.

In addition to the concerns about the air, the possible ground and surface water contamination is very concerning to Loudoun and Virginia residents. The site is known to have ground water that is vulnerable to contamination due to the karst hydrogeology. A USGS study demonstrated that the ground water adjacent to the site to be rezoned communicates readily with surface

water tributaries of the Potomac River. In addition to direct infiltration where water moves directly from the surface to groundwater via porous limestone bedrock, karst is known to have severe ground instability problems. This makes karst geology prone to sinkhole development. Sinkholes provide direct connection between the surface water and any contaminants it may contain and the groundwater. This makes the aquifer vulnerability in karst areas very high, and contamination with industrial activity such as that provided for by this rezoning too likely.

Loudoun sources its drinking water from the Potomac River, downstream of many West Virginia tributaries that carry water from the epikarst and groundwater aquifer at the site to be rezoned. Loudoun has recently completed the new Trap Rock Water Treatment facility, which draws water from the Potomac River. Loudoun currently provides 40 million gallons and projects to provide 90 million gallons of drinking water a day to customers by 2040 (Loudounwater.org). Therefore, the viability of the Potomac River is a high priority for Virginia residents.

Loudoun and Northern Virginia is one of the fastest growing communities in the country and provides a lot to Jefferson County in their symbiotic relationship. Virginia residents support and enjoy Jefferson County through tourism, as our residents enjoy the natural and historical resources of your county. Virginia residents and businesses support the equine industry in a multitude of ways from providing wagering fans at the races to the Virginia Breeders Association Virginia Certified incentive programs and a strong market for retired racehorses. According to an economic impact study from WVU, at least 40% of Jefferson County residents travel outside of West Virginia for work, a good percentage of those travel to northern Virginia. This rezoning would allow for industry that would negatively affect the economy of both places and this relationship and the benefits for our residents gleaned from it.

This zoning change will provide for industry that will negatively effect the health safety and welfare of the Loudon and Northern Virginia community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Dean Erickson

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would put at risk the health and well being of children of Jefferson County.

The type of industry that ordinance #2017-302 would allow in Ranson would generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. Exposure to these pollutants has devastating effects on children's health. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. Developing fetuses whose mothers are exposed to air pollution are more likely to have impaired organ development which can lead to early cognitive deficits, neurodevelopmental defects and other physical, cognitive, and psychological deficits later in life. An association between autism and prenatal exposure to particulate matter in air pollution has been demonstrated in several studies. Many studies have shown that lower test scores in math, English, and language arts are associated with exposure to outdoor air pollution. Industrial activity allowed by ordinance #2017-302 would also increase the risk of groundwater contamination in Ranson and nearby municipalities. Children whose families rely on well water, as is the case in much of Jefferson County, may be affected by polluted water. Voting no on ordinance #2017-302 will prevent air and water pollution from negatively affecting the long-term health of children in Jefferson County and surrounding areas.

The economic and environmental harm caused by the type of industry that ordinance #2017-302 would allow would put additional stress on the parents, caretakers, and teachers of children in affected areas. The weakening and destabilizing of this support network would have negative effects on local children. Many households in Jefferson County depend on the local agriculture, tourism, and equine industries for income. If industrial activity in Ranson depresses these industries, the resulting financial strain on these households will introduce additional

stress and uncertainty into children's lives. Households living in areas affected by particulate matter and regional haze will also suffer from the psychological effects of air pollution. Individuals living in areas with increase perception of pollution show increased levels of stress, anxiety, and unhappiness. School districts affected by increased air and water pollution may have trouble recruiting and retaining teachers. Teachers have a large influence on a child's daily life and, if educator quality and tenure decreases, the quality of this influence will diminish.

The site of the proposed rezoning in Ranson is across the road from an elementary school and proximal to lower-income neighborhoods. Observations like these demonstrate how ordinance #2017-302 would disproportionately affect vulnerable and historically-disadvantaged populations. The damaging health effects of air pollution have been shown to persist for at least three generations, so allowing certain types of industry in low-income areas would only compound existing disadvantages. Voting no on ordinance #2017-302 would be a step towards acknowledging that all individuals have the right to clean air and water.

Children face increased exposure to air pollution, groundwater contamination, financial instability, and environmental discrimination if ordinance #2017-302 is passed. Please vote no on ordinance #2017-302.

Sincerely,

Andrea Stewart

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would negatively affect tourism, economic agility, groundwater quality, and individual health in neighboring municipalities like Shepherdstown.

Tourism is critically important to Shepherdstown's economy and to the county as a whole. In 2018, tourist spending in the Jefferson County contributed over \$170 million to state and local government revenue and \$213 million in individual earnings. Importantly, most of this money comes from tourists visiting from neighboring states like Virginia, Maryland, and Washington D.C. Out-of-state tourists are largely drawn to Jefferson County because of its reputation for environmental-friendly, sustainable industry. Key elements that support this reputation include the county's pastoral scenery and pristine natural resources. Ordinance #2017-302 will allow industry into Jefferson County that risks harming these elements and dramatically reducing the area's appeal to visitors. The resulting harm to our tourist industry would drive away visitors and decrease state, county, and local revenue. The long-term success of Jefferson County's tourism industry is dependent on local governments making coordinated zoning decisions. Allowing certain types in industry in Ranson will negatively affect tourism in every municipality throughout the county, including Shepherdstown. Voting no on ordinance #2017-302 will protect the foundations of the county's tourism industry and protect the 7,040 jobs in Jefferson County that are directly supported by tourism.

The type of large, consolidated industry that ordinance #2017-302 would allow in Ranson would generally reduce the flexibility of local economies in Jefferson County. Historically, the driving industries in Jefferson County have been tourism, agriculture, and the equine industries. These three industries are large conglomerates of small businesses. Small business is very important to Sheherdstown. Small businesses have been shown to create more jobs, cultivate more innovation, and provide more opportunities than big, non-local firms. Additionally, small businesses have been shown to more reactive to sudden changes relative to manufacturing

businesses. Bringing large, manufacturing-based industry into Jefferson county will depress the local economy and stifle innovation. During this time of economic upheaval and uncertainty, Jefferson County needs to support industries that will allow local economies to adapt and recover as fast as possible.

Voting no on ordinance #2017-302 will help protect water resources throughout Jefferson County. The type of industry that ordinance #2017-302 would allow puts the ground resources of Jefferson county at significant risk due to the karst hydrogeology. The site in Ranson is in the Rocky Marsh Run watershed, which is in the source water protection zone for Shepherdstown and drains to the Potomac River. Therefore, activity at this site will affect both groundwater and surface water streams. In municipalities like Shepherdstown, many residents and nearby farms depend on wells for water. Contamination of groundwater aquifers would create both health and remediation concerns for local residents. Dye tests performed by the USGS near the area of proposed rezoning in Ranson have shown just how far-reaching groundwater contamination at the Ranson site could be. Results from the USGS study revealed measurable dye concentrations in Elk's Run, Rattlesnake Run, and even the Shepherdstown Town Run. This last run cuts through the center of Shepherdstown and is a favorite area for children to play and learn to fish.

Groundwater pollution is not the only concern for communities like Shepherdstown. The type of industry that ordinance #2017-302 would allow in Ranson would also generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. These pollutants are particularly harmful to children. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. The site in Ranson is across the road from an elementary school and also within the Jefferson High Middle district. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of children in Shepherdstown and all of Jefferson County.

I again request that you vote no on ordinance #2017-302. The long-term economic, environmental, and community health of municipalities like Shepherdstown depend on Ranson's participation in a coordinated zoning plan for all of Jefferson County.

Sincerely,

William Leonard

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that will significantly harm the municipalities within Jefferson County and beyond effecting the health, welfare, and safety of our community. Harpers Ferry is a national treasure with the natural and historic resources tours flock to see each year and one of the communities that will be negatively impacted by this zoning change.

According to a 2019 study by the West Virginia Tourism Office, Jefferson County generated and average of \$178 million per year in tourism-derived revenue for state and local governments over the last 10 years, more than any other county in West Virginia by at least double. Tourism benefits the businesses and economy of Ranson and Jefferson County producing \$213.7 million in individual earning, 7040 jobs, and \$842.6 million in direct spending here in 2018. We would need 40 Project Shuttles to replace the individual earnings and 59 Rockwools to replace the jobs provided by the tourism industry in Jefferson County. It is important to note that most of the money generated by tourism in Jefferson County comes from neighboring states. In this way it is like an export. Not simply recycling money but bringing money into the state increasing its wealth. Much of the economy in Harpers Ferry is based on this tourism industry. A threat to this industry poses a threat to the economy and welfare of our community.

One of the important drivers for tourism in Harpers Ferry is the Appalachian Trail. According to the Appalachian Trail Conservancy (ATC), Harpers Ferry is the psychologic midpoint of the Trail, and Hikers often plan extended stays in Jefferson County with an obvious positive impact. The ATC reports that the smokestacks and associated lights will be visible in the view shed of 15 vistas on the Appalachian Trail (AT). Studies have shown that quality of vistas and human impact on the environment are not only noticed by visitors but effect their experience. Another study published in the Journal of Applied Recreation Research, found that points of interests and views drew visitors' attention and had a significant impact on their perception of the trail. It was also found that particularly beautiful vistas helped visitors overlook elements that usually

have a negative effect on trail experience like increased trail traffic. A 2009 study in Leisure Sciences revealed that scenic value was a perceptual theme of Appalachian Trail visitors, and that things as simple as dead trees visible in a vista can have a negative impact on visitors overall perception. Imagine the effect the smokestacks will have from the 15 vistas from which they will be visible. The introduction of industrial activity made possible by the proposed rezoning in Ranson would have a negative effect on the scenic views of beautiful landscapes from the Appalachian Trail in Jefferson County.

The smokestacks are not all visitors will be able to see, the air pollution will create haze. The effect of regional haze on tourists was explored in a review article published in the *Atmospheric Environment* titled "Impaired visibility: the air pollution people see." A key takeaway on the negative affect of haze on vacationing tourists was summarized as follows: "Vacations offer an escape from the routine and stress of our daily lives. Vacation destinations are often chosen based on their scenery; vacations are spent gazing at monuments, mountains, clouds, and oceans. Good visibility allows clear observation of distant features and appreciation of the inherent beauty of these scenes...Air pollution, which is often present in both our cities and parks, interferes with these attributes and can ruin the views vacationers travel to enjoy." People seek bucolic, unspoiled areas to escape the stresses of urban areas. A 2004 study in *Environment and Behavior* found Perceived pollution causes stress while viewing natural scenes has both psychological and physiological benefits, and a 2007 study confirmed these benefits. Two other studies found that people are emotionally affected by poor visibility, and tourists are disappointed when views are obscured by haze. The combination of smokestacks and haze will mar the viewshed and will not only reduce the positive effects of a scenic landscape but also leave tourists disappointed and dissatisfied with their choice of destination. With these effects the welfare of the Harpers Ferry community would undoubtedly be endangered by the industry that this zoning change will provide for.

Multiple studies by doctors Kozar, Doctor, and Doctor have demonstrated that the land at this site to be rezoned is Karst with the highest likelihood of sinkhole development in the county, and that the ground water aquifer there is incredibly sensitive to contamination from surface water. Further, this site is on an upland plain with relatively few surface streams, seasonal variability in the water table that results in numerous estavelles, and large amounts of water in the epikarst. In this area contamination in surface water communicates easily to the water in the epikarst via diffuse and point infiltration, and the springs at the margins of the upland area are directly affected by the water quality throughout the aquifer. According to Jefferson Orchards Voluntary Remediation Plan with the WVDEP, the ground water at the site is approximately 60 feet below the ground, and the tests performed by the USGS have shown that ground water from just adjacent to this site emerged in the headwaters of both the Elk's Run and Rattlesnake Run. This is critically important for Harpers Ferry because the Elk's Run headwaters is a spring about three miles south east of the site and goes on to become the drinking water source for Harpers Ferry and Bolivar before emptying into the Potomac River. The headwaters of Rattlesnake Run is a spring about 3.5 miles from the site and is also a tributary of the Potomac River. The Potomac River is the back up water source for Harpers Ferry. This means that the activity at the site will have a critical influence on the drinking water

of Harpers Ferry. In this was the industry permitted by this change in zoning would undoubtedly endanger the health and safety of the community in Harpers Ferry.

The untoward health effects and individual economic consequences from the pollution emissions of the industry this rezoning will allow that will be born out over the length of peoples lives and that of their decedents for at least 3 generations is an egregious example of environmental injustice that should not be tolerated. This zoning change may be in one of the poorest sections of the county but the effects will be felt in every part of Ranson and the county.

The Comprehensive plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” The industry that this rezoning will allow will jeopardize the health, safety and welfare of Ranson, Harpers Ferry and the whole county. Please vote no on the ordinance #2017-302.

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote NO on Ordinance #2017-302. This rezoning will put an undue hardship on protection of surface water in Charles Town, risking the health, safety and welfare of the community.

The nature of the industry that this zoning will allow will be harmful to our local economy. Charles Town has spent a lot of time and money improving our downtown area for restaurants and retail. We are working to take advantage of the tourism industry in our county and bring more people into Charles Town. The eye sore, noise pollution, air pollution, and obvious move away from sustainability will drive people away from Jefferson County and Charles Town, rendering our efforts ineffective and unrewarding. This will make it harder for our small businesses to be successful.

According to the 2018 WVU economic study of the eastern panhandle, over 40% of the workforce in Jefferson County choose to work outside of the state. These commuters bring that money home and spend it here supporting our local small businesses, economy and government. Charles Town has a large number of residents who commute. These typically higher earners may choose to leave the area because of the presence of the industry that this zoning change would provide for. This will cause a hardship on our economy and municipality.

The industry that this zoning will allow will cause stress for multiple reasons on the Charles Town wastewater treatment systems and the surface waterways in Jefferson County and beyond. The industry currently planning to utilize the zoning change will have discharge to the wastewater system that is high in chloride, primarily from its water softening system. The NPDES permit modification allows up to 5,000 mg/L. Chloride is not settled or removed at the wastewater treatment plant. It cannot be removed by conventional means and would be prohibitively expensive to do by new technology. This is of concern to Charles Town because chloride can harm stream water and also impair functioning of the wastewater treatment plant.

Furthermore, the corrosive nature of chloride can cause damage to pipes both in the wastewater system and those used by downstream drinking water systems, like the \$207 million Trap Rock Water Treatment plant in Loudoun.

The human health criteria for chloride under WV standards is 250 mg/L. Under low stream flow conditions, chloride additions to the treatment plant effluent, as proposed by the industry currently planning to utilize the zoning change, could cause chloride levels in Evitts Run to exceed this standard. If the amount of chloride increased due to expansion or higher throughput, then this human health standard would be violated frequently. Chlorides are also known to harm aquatic life and effect metal toxicity in rivers. The USEPA and several states have surface water guidelines of 230mg/L for chronic exposure. This would also pose a risk of damaging the water treatment facilities downstream on the Potomac River.

A research study by Lefebvre and Moletta in 2006 showed that chloride and salinity impair the ability of wastewater treatment to remove phosphorus and nitrogen, and because of this, other states have introduced legislation to treat saline wastewater. Uygur and Kargi in 2004 looked at the effects of salt on synthetic wastewater treatment. They found that removal of both nitrogen and phosphorus was reduced when salinity increased from 0 to 6%. In fact, the removal efficiency of ammonia dropped from 96% to 39% with this increasing salinity. Hong et al. In 2016 found phosphorous removal decreased 20-28% when chloride concentrations went from 150 mg/L to 1,500 mg/L. Phosphorous removal was completely inhibited at concentrations greater than 2,500 mg/L. This increased salinity has the potential to make the Charles Town wastewater treatment system work far less efficiently.

In addition to the contents of the wastewater this type of industry will produce, the volume of sewage is itself a concern. Given that the City of Charles Town has been in violation of its permit on numerous occasions for spills and overflow of untreated sewage, adding large volumes of wastewater will further challenge the near capacity system. This will mean that costly capacity upgrades will need to be done likely sooner than they would have needed to be done, imposing further financial strain on the system.

This zoning change will provide for industry the likes of which are not present in this county and have not been present in this county for many decades. We find it appalling that the introduction of zoning for such industry is being done in an area of the county that is historically underserved and lower income. It is even more egregious because the worst effects including air pollution and groundwater contamination will be felt first and most severely in the immediate vicinity, and Ranson does not even have residents in the immediate vicinity of the proposed zoning change. This decision is being contemplated without representation of those who will be most affected. This would be a deplorable example of environmental injustice.

This zoning will provide for industry that will harm our economy, drive away residents, challenge and or damage our infrastructure, and may damage our waterways and wild life. This is being done with out representation of those it will affect the most. Please vote NO on Ordinance #2017-302.

Sincerely,

Susan Brousseau

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that will significantly harm the municipalities within Jefferson County and beyond effecting the health, welfare, and safety of our community. Harpers Ferry is a national treasure with the natural and historic resources tours flock to see each year and one of the communities that will be negatively impacted by this zoning change.

According to a 2019 study by the West Virginia Tourism Office, Jefferson County generated and average of \$178 million per year in tourism-derived revenue for state and local governments over the last 10 years, more than any other county in West Virginia by at least double. Tourism benefits the businesses and economy of Ranson and Jefferson County producing \$213.7 million in individual earning, 7040 jobs, and \$842.6 million in direct spending here in 2018. We would need 40 Project Shuttles to replace the individual earnings and 59 Rockwools to replace the jobs provided by the tourism industry in Jefferson County. It is important to note that most of the money generated by tourism in Jefferson County comes from neighboring states. In this way it is like an export. Not simply recycling money but bringing money into the state increasing its wealth. Much of the economy in Harpers Ferry is based on this tourism industry. A threat to this industry poses a threat to the economy and welfare of our community.

One of the important drivers for tourism in Harpers Ferry is the Appalachian Trail. According to the Appalachian Trail Conservancy (ATC), Harpers Ferry is the psychologic midpoint of the Trail, and Hikers often plan extended stays in Jefferson County with an obvious positive impact. The ATC reports that the smokestacks and associated lights will be visible in the view shed of 15 vistas on the Appalachian Trail (AT). Studies have shown that quality of vistas and human impact on the environment are not only noticed by visitors but effect their experience. Another study published in the Journal of Applied Recreation Research, found that points of interests and views drew visitors' attention and had a significant impact on their perception of the trail. It was also found that particularly beautiful vistas helped visitors overlook elements that usually

have a negative effect on trail experience like increased trail traffic. A 2009 study in Leisure Sciences revealed that scenic value was a perceptual theme of Appalachian Trail visitors, and that things as simple as dead trees visible in a vista can have a negative impact on visitors overall perception. Imagine the effect the smokestacks will have from the 15 vistas from which they will be visible. The introduction of industrial activity made possible by the proposed rezoning in Ranson would have a negative effect on the scenic views of beautiful landscapes from the Appalachian Trail in Jefferson County.

The smokestacks are not all visitors will be able to see, the air pollution will create haze. The effect of regional haze on tourists was explored in a review article published in the *Atmospheric Environment* titled "Impaired visibility: the air pollution people see." A key takeaway on the negative affect of haze on vacationing tourists was summarized as follows: "Vacations offer an escape from the routine and stress of our daily lives. Vacation destinations are often chosen based on their scenery; vacations are spent gazing at monuments, mountains, clouds, and oceans. Good visibility allows clear observation of distant features and appreciation of the inherent beauty of these scenes...Air pollution, which is often present in both our cities and parks, interferes with these attributes and can ruin the views vacationers travel to enjoy." People seek bucolic, unspoiled areas to escape the stresses of urban areas. A 2004 study in *Environment and Behavior* found Perceived pollution causes stress while viewing natural scenes has both psychological and physiological benefits, and a 2007 study confirmed these benefits. Two other studies found that people are emotionally affected by poor visibility, and tourists are disappointed when views are obscured by haze. The combination of smokestacks and haze will mar the viewshed and will not only reduce the positive effects of a scenic landscape but also leave tourists disappointed and dissatisfied with their choice of destination. With these effects the welfare of the Harpers Ferry community would undoubtedly be endangered by the industry that this zoning change will provide for.

Multiple studies by doctors Kozar, Doctor, and Doctor have demonstrated that the land at this site to be rezoned is Karst with the highest likelihood of sinkhole development in the county, and that the ground water aquifer there is incredibly sensitive to contamination from surface water. Further, this site is on an upland plain with relatively few surface streams, seasonal variability in the water table that results in numerous estavelles, and large amounts of water in the epikarst. In this area contamination in surface water communicates easily to the water in the epikarst via diffuse and point infiltration, and the springs at the margins of the upland area are directly affected by the water quality throughout the aquifer. According to Jefferson Orchards Voluntary Remediation Plan with the WVDEP, the ground water at the site is approximately 60 feet below the ground, and the tests performed by the USGS have shown that ground water from just adjacent to this site emerged in the headwaters of both the Elk's Run and Rattlesnake Run. This is critically important for Harpers Ferry because the Elk's Run headwaters is a spring about three miles south east of the site and goes on to become the drinking water source for Harpers Ferry and Bolivar before emptying into the Potomac River. The headwaters of Rattlesnake Run is a spring about 3.5 miles from the site and is also a tributary of the Potomac River. The Potomac River is the back up water source for Harpers Ferry. This means that the activity at the site will have a critical influence on the drinking water

of Harpers Ferry. In this was the industry permitted by this change in zoning would undoubtedly endanger the health and safety of the community in Harpers Ferry.

The untoward health effects and individual economic consequences from the pollution emissions of the industry this rezoning will allow that will be born out over the length of peoples lives and that of their decedents for at least 3 generations is an egregious example of environmental injustice that should not be tolerated. This zoning change may be in one of the poorest sections of the county but the effects will be felt in every part of Ranson and the county.

The Comprehensive plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” The industry that this rezoning will allow will jeopardize the health, safety and welfare of Ranson, Harpers Ferry and the whole county. Please vote no on the ordinance #2017-302.

Sincerely,

Elizabeth McGowen

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

if you cared about the personal property being damaged by people during protests, but are in favor of industrial pollution destroying our environment YOU are a hypocrite!!!

AND don't care.

All you care about is lining your pockets, your payoff will run out, the air and other pollutants will only compound.

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

“10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community.”

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Susan Hewitt

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on #2017-302. The air emissions, possibility of ground and surface water contamination, and their effect on our interwoven economies threaten the health, safety and welfare of not just Jefferson County but the greater region, including Loudoun and the greater Northern Virginia area.

This zoning would provide for industry that produces large amounts of air emissions. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. Northern Virginia is directly downwind from these emissions. Much of the gaseous, fine particulate, and hazardous emissions can reach Northern Virginia. Further affecting the outdoor air quality of the adjacent portion of Virginia and the ability of these areas to achieve and maintain National Ambient Air Quality Standards (NAAQS) attainment. This will affect agriculture and outdoor leisure and recreation.

For example, Loudoun County has been in nonattainment for the NAAQS 8-hour Ozone standard for the past two years. VOC and NO_x react after they have been emitted to produce ground level ozone. The industry that this rezoning would provide for would produce large amounts of these emissions. This would make it even harder as Loudoun County tries to achieve attainment. As time goes on and the scientific research advances our knowledge and understanding of the extent to which gaseous, particulate and hazardous emissions affect human health the NAAQS standards are likely to be reduced. The effects on air emission from this rezoning will make it only harder for Loudoun and Northern Virginia to meet these standards.

In addition to the concerns about the air, the possible ground and surface water contamination is very concerning to Loudoun and Virginia residents. The site is known to have ground water that is vulnerable to contamination due to the karst hydrogeology. A USGS study demonstrated that the ground water adjacent to the site to be rezoned communicates readily with surface

water tributaries of the Potomac River. In addition to direct infiltration where water moves directly from the surface to groundwater via porous limestone bedrock, karst is known to have severe ground instability problems. This makes karst geology prone to sinkhole development. Sinkholes provide direct connection between the surface water and any contaminants it may contain and the groundwater. This makes the aquifer vulnerability in karst areas very high, and contamination with industrial activity such as that provided for by this rezoning too likely.

Loudoun sources its drinking water from the Potomac River, downstream of many West Virginia tributaries that carry water from the epikarst and groundwater aquifer at the site to be rezoned. Loudoun has recently completed the new Trap Rock Water Treatment facility, which draws water from the Potomac River. Loudoun currently provides 40 million gallons and projects to provide 90 million gallons of drinking water a day to customers by 2040 (Loudounwater.org). Therefore, the viability of the Potomac River is a high priority for Virginia residents.

Loudoun and Northern Virginia is one of the fastest growing communities in the country and provides a lot to Jefferson County in their symbiotic relationship. Virginia residents support and enjoy Jefferson County through tourism, as our residents enjoy the natural and historical resources of your county. Virginia residents and businesses support the equine industry in a multitude of ways from providing wagering fans at the races to the Virginia Breeders Association Virginia Certified incentive programs and a strong market for retired racehorses. According to an economic impact study from WVU, at least 40% of Jefferson County residents travel outside of West Virginia for work, a good percentage of those travel to northern Virginia. This rezoning would allow for industry that would negatively affect the economy of both places and this relationship and the benefits for our residents gleaned from it.

This zoning change will provide for industry that will negatively effect the health safety and welfare of the Loudon and Northern Virginia community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Maura Johnson

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would negatively affect tourism, economic agility, groundwater quality, and individual health in neighboring municipalities like Shepherdstown.

Tourism is critically important to Shepherdstown's economy and to the county as a whole. In 2018, tourist spending in the Jefferson County contributed over \$170 million to state and local government revenue and \$213 million in individual earnings. Importantly, most of this money comes from tourists visiting from neighboring states like Virginia, Maryland, and Washington D.C. Out-of-state tourists are largely drawn to Jefferson County because of its reputation for environmental-friendly, sustainable industry. Key elements that support this reputation include the county's pastoral scenery and pristine natural resources. Ordinance #2017-302 will allow industry into Jefferson County that risks harming these elements and dramatically reducing the area's appeal to visitors. The resulting harm to our tourist industry would drive away visitors and decrease state, county, and local revenue. The long-term success of Jefferson County's tourism industry is dependent on local governments making coordinated zoning decisions. Allowing certain types in industry in Ranson will negatively affect tourism in every municipality throughout the county, including Shepherdstown. Voting no on ordinance #2017-302 will protect the foundations of the county's tourism industry and protect the 7,040 jobs in Jefferson County that are directly supported by tourism.

The type of large, consolidated industry that ordinance #2017-302 would allow in Ranson would generally reduce the flexibility of local economies in Jefferson County. Historically, the driving industries in Jefferson County have been tourism, agriculture, and the equine industries. These three industries are large conglomerates of small businesses. Small business is very important to Sheherdstown. Small businesses have been shown to create more jobs, cultivate more innovation, and provide more opportunities than big, non-local firms. Additionally, small businesses have been shown to more reactive to sudden changes relative to manufacturing

businesses. Bringing large, manufacturing-based industry into Jefferson county will depress the local economy and stifle innovation. During this time of economic upheaval and uncertainty, Jefferson County needs to support industries that will allow local economies to adapt and recover as fast as possible.

Voting no on ordinance #2017-302 will help protect water resources throughout Jefferson County. The type of industry that ordinance #2017-302 would allow puts the ground resources of Jefferson county at significant risk due to the karst hydrogeology. The site in Ranson is in the Rocky Marsh Run watershed, which is in the source water protection zone for Shepherdstown and drains to the Potomac River. Therefore, activity at this site will affect both groundwater and surface water streams. In municipalities like Shepherdstown, many residents and nearby farms depend on wells for water. Contamination of groundwater aquifers would create both health and remediation concerns for local residents. Dye tests performed by the USGS near the area of proposed rezoning in Ranson have shown just how far-reaching groundwater contamination at the Ranson site could be. Results from the USGS study revealed measurable dye concentrations in Elk's Run, Rattlesnake Run, and even the Shepherdstown Town Run. This last run cuts through the center of Shepherdstown and is a favorite area for children to play and learn to fish.

Groundwater pollution is not the only concern for communities like Shepherdstown. The type of industry that ordinance #2017-302 would allow in Ranson would also generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. These pollutants are particularly harmful to children. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. The site in Ranson is across the road from an elementary school and also within the Jefferson High Middle district. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of children in Shepherdstown and all of Jefferson County.

I again request that you vote no on ordinance #2017-302. The long-term economic, environmental, and community health of municipalities like Shepherdstown depend on Ranson's participation in a coordinated zoning plan for all of Jefferson County.

Sincerely,

Rachael Meads
Shepherdstown, 25443

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on #2017-302. The air emissions, possibility of ground and surface water contamination, and their effect on our interwoven economies threaten the health, safety and welfare of not just Jefferson County but the greater region, including Loudoun and the greater Northern Virginia area.

This zoning would provide for industry that produces large amounts of air emissions. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. Northern Virginia is directly downwind from these emissions. Much of the gaseous, fine particulate, and hazardous emissions can reach Northern Virginia. Further affecting the outdoor air quality of the adjacent portion of Virginia and the ability of these areas to achieve and maintain National Ambient Air Quality Standards (NAAQS) attainment. This will affect agriculture and outdoor leisure and recreation.

For example, Loudoun County has been in nonattainment for the NAAQS 8-hour Ozone standard for the past two years. VOC and NO_x react after they have been emitted to produce ground level ozone. The industry that this rezoning would provide for would produce large amounts of these emissions. This would make it even harder as Loudoun County tries to achieve attainment. As time goes on and the scientific research advances our knowledge and understanding of the extent to which gaseous, particulate and hazardous emissions affect human health the NAAQS standards are likely to be reduced. The effects on air emission from this rezoning will make it only harder for Loudoun and Northern Virginia to meet these standards.

In addition to the concerns about the air, the possible ground and surface water contamination is very concerning to Loudoun and Virginia residents. The site is known to have ground water that is vulnerable to contamination due to the karst hydrogeology. A USGS study demonstrated that the ground water adjacent to the site to be rezoned communicates readily with surface

water tributaries of the Potomac River. In addition to direct infiltration where water moves directly from the surface to groundwater via porous limestone bedrock, karst is known to have severe ground instability problems. This makes karst geology prone to sinkhole development. Sinkholes provide direct connection between the surface water and any contaminants it may contain and the groundwater. This makes the aquifer vulnerability in karst areas very high, and contamination with industrial activity such as that provided for by this rezoning too likely.

Loudoun sources its drinking water from the Potomac River, downstream of many West Virginia tributaries that carry water from the epikarst and groundwater aquifer at the site to be rezoned. Loudoun has recently completed the new Trap Rock Water Treatment facility, which draws water from the Potomac River. Loudoun currently provides 40 million gallons and projects to provide 90 million gallons of drinking water a day to customers by 2040 (Loudounwater.org). Therefore, the viability of the Potomac River is a high priority for Virginia residents.

Loudoun and Northern Virginia is one of the fastest growing communities in the country and provides a lot to Jefferson County in their symbiotic relationship. Virginia residents support and enjoy Jefferson County through tourism, as our residents enjoy the natural and historical resources of your county. Virginia residents and businesses support the equine industry in a multitude of ways from providing wagering fans at the races to the Virginia Breeders Association Virginia Certified incentive programs and a strong market for retired racehorses. According to an economic impact study from WVU, at least 40% of Jefferson County residents travel outside of West Virginia for work, a good percentage of those travel to northern Virginia. This rezoning would allow for industry that would negatively affect the economy of both places and this relationship and the benefits for our residents gleaned from it.

This zoning change will provide for industry that will negatively effect the health safety and welfare of the Loudon and Northern Virginia community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that will significantly harm the municipalities within Jefferson County and beyond effecting the health, welfare, and safety of our community. Harpers Ferry is a national treasure with the natural and historic resources tours flock to see each year and one of the communities that will be negatively impacted by this zoning change.

According to a 2019 study by the West Virginia Tourism Office, Jefferson County generated and average of \$178 million per year in tourism-derived revenue for state and local governments over the last 10 years, more than any other county in West Virginia by at least double. Tourism benefits the businesses and economy of Ranson and Jefferson County producing \$213.7 million in individual earning, 7040 jobs, and \$842.6 million in direct spending here in 2018. We would need 40 Project Shuttles to replace the individual earnings and 59 Rockwools to replace the jobs provided by the tourism industry in Jefferson County. It is important to note that most of the money generated by tourism in Jefferson County comes from neighboring states. In this way it is like an export. Not simply recycling money but bringing money into the state increasing its wealth. Much of the economy in Harpers Ferry is based on this tourism industry. A threat to this industry poses a threat to the economy and welfare of our community.

One of the important drivers for tourism in Harpers Ferry is the Appalachian Trail. According to the Appalachian Trail Conservancy (ATC), Harpers Ferry is the psychologic midpoint of the Trail, and Hikers often plan extended stays in Jefferson County with an obvious positive impact. The ATC reports that the smokestacks and associated lights will be visible in the view shed of 15 vistas on the Appalachian Trail (AT). Studies have shown that quality of vistas and human impact on the environment are not only noticed by visitors but effect their experience. Another study published in the Journal of Applied Recreation Research, found that points of interests and views drew visitors' attention and had a significant impact on their perception of the trail. It was also found that particularly beautiful vistas helped visitors overlook elements that usually

have a negative effect on trail experience like increased trail traffic. A 2009 study in Leisure Sciences revealed that scenic value was a perceptual theme of Appalachian Trail visitors, and that things as simple as dead trees visible in a vista can have a negative impact on visitors overall perception. Imagine the effect the smokestacks will have from the 15 vistas from which they will be visible. The introduction of industrial activity made possible by the proposed rezoning in Ranson would have a negative effect on the scenic views of beautiful landscapes from the Appalachian Trail in Jefferson County.

The smokestacks are not all visitors will be able to see, the air pollution will create haze. The effect of regional haze on tourists was explored in a review article published in the *Atmospheric Environment* titled "Impaired visibility: the air pollution people see." A key takeaway on the negative affect of haze on vacationing tourists was summarized as follows: "Vacations offer an escape from the routine and stress of our daily lives. Vacation destinations are often chosen based on their scenery; vacations are spent gazing at monuments, mountains, clouds, and oceans. Good visibility allows clear observation of distant features and appreciation of the inherent beauty of these scenes...Air pollution, which is often present in both our cities and parks, interferes with these attributes and can ruin the views vacationers travel to enjoy." People seek bucolic, unspoiled areas to escape the stresses of urban areas. A 2004 study in *Environment and Behavior* found Perceived pollution causes stress while viewing natural scenes has both psychological and physiological benefits, and a 2007 study confirmed these benefits. Two other studies found that people are emotionally affected by poor visibility, and tourists are disappointed when views are obscured by haze. The combination of smokestacks and haze will mar the viewshed and will not only reduce the positive effects of a scenic landscape but also leave tourists disappointed and dissatisfied with their choice of destination. With these effects the welfare of the Harpers Ferry community would undoubtedly be endangered by the industry that this zoning change will provide for.

Multiple studies by doctors Kozar, Doctor, and Doctor have demonstrated that the land at this site to be rezoned is Karst with the highest likelihood of sinkhole development in the county, and that the ground water aquifer there is incredibly sensitive to contamination from surface water. Further, this site is on an upland plain with relatively few surface streams, seasonal variability in the water table that results in numerous estavelles, and large amounts of water in the epikarst. In this area contamination in surface water communicates easily to the water in the epikarst via diffuse and point infiltration, and the springs at the margins of the upland area are directly affected by the water quality throughout the aquifer. According to Jefferson Orchards Voluntary Remediation Plan with the WVDEP, the ground water at the site is approximately 60 feet below the ground, and the tests performed by the USGS have shown that ground water from just adjacent to this site emerged in the headwaters of both the Elk's Run and Rattlesnake Run. This is critically important for Harpers Ferry because the Elk's Run headwaters is a spring about three miles south east of the site and goes on to become the drinking water source for Harpers Ferry and Bolivar before emptying into the Potomac River. The headwaters of Rattlesnake Run is a spring about 3.5 miles from the site and is also a tributary of the Potomac River. The Potomac River is the back up water source for Harpers Ferry. This means that the activity at the site will have a critical influence on the drinking water

of Harpers Ferry. In this was the industry permitted by this change in zoning would undoubtedly endanger the health and safety of the community in Harpers Ferry.

The untoward health effects and individual economic consequences from the pollution emissions of the industry this rezoning will allow that will be born out over the length of peoples lives and that of their decedents for at least 3 generations is an egregious example of environmental injustice that should not be tolerated. This zoning change may be in one of the poorest sections of the county but the effects will be felt in every part of Ranson and the county.

The Comprehensive plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” The industry that this rezoning will allow will jeopardize the health, safety and welfare of Ranson, Harpers Ferry and the whole county. Please vote no on the ordinance #2017-302.

Sincerely,

Stephanie Cotterill

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would negatively affect tourism, economic agility, groundwater quality, and individual health in neighboring municipalities like Shepherdstown.

Tourism is critically important to Shepherdstown's economy and to the county as a whole. In 2018, tourist spending in the Jefferson County contributed over \$170 million to state and local government revenue and \$213 million in individual earnings. Importantly, most of this money comes from tourists visiting from neighboring states like Virginia, Maryland, and Washington D.C. Out-of-state tourists are largely drawn to Jefferson County because of its reputation for environmental-friendly, sustainable industry. Key elements that support this reputation include the county's pastoral scenery and pristine natural resources. Ordinance #2017-302 will allow industry into Jefferson County that risks harming these elements and dramatically reducing the area's appeal to visitors. The resulting harm to our tourist industry would drive away visitors and decrease state, county, and local revenue. The long-term success of Jefferson County's tourism industry is dependent on local governments making coordinated zoning decisions. Allowing certain types in industry in Ranson will negatively affect tourism in every municipality throughout the county, including Shepherdstown. Voting no on ordinance #2017-302 will protect the foundations of the county's tourism industry and protect the 7,040 jobs in Jefferson County that are directly supported by tourism.

The type of large, consolidated industry that ordinance #2017-302 would allow in Ranson would generally reduce the flexibility of local economies in Jefferson County. Historically, the driving industries in Jefferson County have been tourism, agriculture, and the equine industries. These three industries are large conglomerates of small businesses. Small business is very important to Sheherdstown. Small businesses have been shown to create more jobs, cultivate more innovation, and provide more opportunities than big, non-local firms. Additionally, small businesses have been shown to more reactive to sudden changes relative to manufacturing

businesses. Bringing large, manufacturing-based industry into Jefferson county will depress the local economy and stifle innovation. During this time of economic upheaval and uncertainty, Jefferson County needs to support industries that will allow local economies to adapt and recover as fast as possible.

Voting no on ordinance #2017-302 will help protect water resources throughout Jefferson County. The type of industry that ordinance #2017-302 would allow puts the ground resources of Jefferson county at significant risk due to the karst hydrogeology. The site in Ranson is in the Rocky Marsh Run watershed, which is in the source water protection zone for Shepherdstown and drains to the Potomac River. Therefore, activity at this site will affect both groundwater and surface water streams. In municipalities like Shepherdstown, many residents and nearby farms depend on wells for water. Contamination of groundwater aquifers would create both health and remediation concerns for local residents. Dye tests performed by the USGS near the area of proposed rezoning in Ranson have shown just how far-reaching groundwater contamination at the Ranson site could be. Results from the USGS study revealed measurable dye concentrations in Elk's Run, Rattlesnake Run, and even the Shepherdstown Town Run. This last run cuts through the center of Shepherdstown and is a favorite area for children to play and learn to fish.

Groundwater pollution is not the only concern for communities like Shepherdstown. The type of industry that ordinance #2017-302 would allow in Ranson would also generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. These pollutants are particularly harmful to children. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. The site in Ranson is across the road from an elementary school and also within the Jefferson High Middle district. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of children in Shepherdstown and all of Jefferson County.

I again request that you vote no on ordinance #2017-302. The long-term economic, environmental, and community health of municipalities like Shepherdstown depend on Ranson's participation in a coordinated zoning plan for all of Jefferson County.

Sincerely,

Phillip Simpson
Shepherdstown, 25443

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on #2017-302. The air emissions, possibility of ground and surface water contamination, and their effect on our interwoven economies threaten the health, safety and welfare of not just Jefferson County but the greater region, including Loudoun and the greater Northern Virginia area.

This zoning would provide for industry that produces large amounts of air emissions. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. Northern Virginia is directly downwind from these emissions. Much of the gaseous, fine particulate, and hazardous emissions can reach Northern Virginia. Further affecting the outdoor air quality of the adjacent portion of Virginia and the ability of these areas to achieve and maintain National Ambient Air Quality Standards (NAAQS) attainment. This will affect agriculture and outdoor leisure and recreation.

For example, Loudoun County has been in nonattainment for the NAAQS 8-hour Ozone standard for the past two years. VOC and NO_x react after they have been emitted to produce ground level ozone. The industry that this rezoning would provide for would produce large amounts of these emissions. This would make it even harder as Loudoun County tries to achieve attainment. As time goes on and the scientific research advances our knowledge and understanding of the extent to which gaseous, particulate and hazardous emissions affect human health the NAAQS standards are likely to be reduced. The effects on air emission from this rezoning will make it only harder for Loudoun and Northern Virginia to meet these standards.

In addition to the concerns about the air, the possible ground and surface water contamination is very concerning to Loudoun and Virginia residents. The site is known to have ground water that is vulnerable to contamination due to the karst hydrogeology. A USGS study demonstrated that the ground water adjacent to the site to be rezoned communicates readily with surface

water tributaries of the Potomac River. In addition to direct infiltration where water moves directly from the surface to groundwater via porous limestone bedrock, karst is known to have severe ground instability problems. This makes karst geology prone to sinkhole development. Sinkholes provide direct connection between the surface water and any contaminants it may contain and the groundwater. This makes the aquifer vulnerability in karst areas very high, and contamination with industrial activity such as that provided for by this rezoning too likely.

Loudoun sources its drinking water from the Potomac River, downstream of many West Virginia tributaries that carry water from the epikarst and groundwater aquifer at the site to be rezoned. Loudoun has recently completed the new Trap Rock Water Treatment facility, which draws water from the Potomac River. Loudoun currently provides 40 million gallons and projects to provide 90 million gallons of drinking water a day to customers by 2040 (Loudounwater.org). Therefore, the viability of the Potomac River is a high priority for Virginia residents.

Loudoun and Northern Virginia is one of the fastest growing communities in the country and provides a lot to Jefferson County in their symbiotic relationship. Virginia residents support and enjoy Jefferson County through tourism, as our residents enjoy the natural and historical resources of your county. Virginia residents and businesses support the equine industry in a multitude of ways from providing wagering fans at the races to the Virginia Breeders Association Virginia Certified incentive programs and a strong market for retired racehorses. According to an economic impact study from WVU, at least 40% of Jefferson County residents travel outside of West Virginia for work, a good percentage of those travel to northern Virginia. This rezoning would allow for industry that would negatively affect the economy of both places and this relationship and the benefits for our residents gleaned from it.

This zoning change will provide for industry that will negatively effect the health safety and welfare of the Loudon and Northern Virginia community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Joelle Burgess

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on #2017-302. The air emissions, possibility of ground and surface water contamination, and their effect on our interwoven economies threaten the health, safety and welfare of not just Jefferson County but the greater region, including Loudoun and the greater Northern Virginia area.

This zoning would provide for industry that produces large amounts of air emissions. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. Northern Virginia is directly downwind from these emissions. Much of the gaseous, fine particulate, and hazardous emissions can reach Northern Virginia. Further affecting the outdoor air quality of the adjacent portion of Virginia and the ability of these areas to achieve and maintain National Ambient Air Quality Standards (NAAQS) attainment. This will affect agriculture and outdoor leisure and recreation.

For example, Loudoun County has been in nonattainment for the NAAQS 8-hour Ozone standard for the past two years. VOC and NO_x react after they have been emitted to produce ground level ozone. The industry that this rezoning would provide for would produce large amounts of these emissions. This would make it even harder as Loudoun County tries to achieve attainment. As time goes on and the scientific research advances our knowledge and understanding of the extent to which gaseous, particulate and hazardous emissions affect human health the NAAQS standards are likely to be reduced. The effects on air emission from this rezoning will make it only harder for Loudoun and Northern Virginia to meet these standards.

In addition to the concerns about the air, the possible ground and surface water contamination is very concerning to Loudoun and Virginia residents. The site is known to have ground water that is vulnerable to contamination due to the karst hydrogeology. A USGS study demonstrated that the ground water adjacent to the site to be rezoned communicates readily with surface

water tributaries of the Potomac River. In addition to direct infiltration where water moves directly from the surface to groundwater via porous limestone bedrock, karst is known to have severe ground instability problems. This makes karst geology prone to sinkhole development. Sinkholes provide direct connection between the surface water and any contaminants it may contain and the groundwater. This makes the aquifer vulnerability in karst areas very high, and contamination with industrial activity such as that provided for by this rezoning too likely.

Loudoun sources its drinking water from the Potomac River, downstream of many West Virginia tributaries that carry water from the epikarst and groundwater aquifer at the site to be rezoned. Loudoun has recently completed the new Trap Rock Water Treatment facility, which draws water from the Potomac River. Loudoun currently provides 40 million gallons and projects to provide 90 million gallons of drinking water a day to customers by 2040 (Loudounwater.org). Therefore, the viability of the Potomac River is a high priority for Virginia residents.

Loudoun and Northern Virginia is one of the fastest growing communities in the country and provides a lot to Jefferson County in their symbiotic relationship. Virginia residents support and enjoy Jefferson County through tourism, as our residents enjoy the natural and historical resources of your county. Virginia residents and businesses support the equine industry in a multitude of ways from providing wagering fans at the races to the Virginia Breeders Association Virginia Certified incentive programs and a strong market for retired racehorses. According to an economic impact study from WVU, at least 40% of Jefferson County residents travel outside of West Virginia for work, a good percentage of those travel to northern Virginia. This rezoning would allow for industry that would negatively affect the economy of both places and this relationship and the benefits for our residents gleaned from it.

This zoning change will provide for industry that will negatively effect the health safety and welfare of the Loudon and Northern Virginia community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Lauren Farrow

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would negatively affect tourism, economic agility, groundwater quality, and individual health in neighboring municipalities like Shepherdstown.

Tourism is critically important to Shepherdstown's economy and to the county as a whole. In 2018, tourist spending in the Jefferson County contributed over \$170 million to state and local government revenue and \$213 million in individual earnings. Importantly, most of this money comes from tourists visiting from neighboring states like Virginia, Maryland, and Washington D.C. Out-of-state tourists are largely drawn to Jefferson County because of its reputation for environmental-friendly, sustainable industry. Key elements that support this reputation include the county's pastoral scenery and pristine natural resources. Ordinance #2017-302 will allow industry into Jefferson County that risks harming these elements and dramatically reducing the area's appeal to visitors. The resulting harm to our tourist industry would drive away visitors and decrease state, county, and local revenue. The long-term success of Jefferson County's tourism industry is dependent on local governments making coordinated zoning decisions. Allowing certain types in industry in Ranson will negatively affect tourism in every municipality throughout the county, including Shepherdstown. Voting no on ordinance #2017-302 will protect the foundations of the county's tourism industry and protect the 7,040 jobs in Jefferson County that are directly supported by tourism.

The type of large, consolidated industry that ordinance #2017-302 would allow in Ranson would generally reduce the flexibility of local economies in Jefferson County. Historically, the driving industries in Jefferson County have been tourism, agriculture, and the equine industries. These three industries are large conglomerates of small businesses. Small business is very important to Sheherdstown. Small businesses have been shown to create more jobs, cultivate more innovation, and provide more opportunities than big, non-local firms. Additionally, small businesses have been shown to more reactive to sudden changes relative to manufacturing

businesses. Bringing large, manufacturing-based industry into Jefferson county will depress the local economy and stifle innovation. During this time of economic upheaval and uncertainty, Jefferson County needs to support industries that will allow local economies to adapt and recover as fast as possible.

Voting no on ordinance #2017-302 will help protect water resources throughout Jefferson County. The type of industry that ordinance #2017-302 would allow puts the ground resources of Jefferson county at significant risk due to the karst hydrogeology. The site in Ranson is in the Rocky Marsh Run watershed, which is in the source water protection zone for Shepherdstown and drains to the Potomac River. Therefore, activity at this site will affect both groundwater and surface water streams. In municipalities like Shepherdstown, many residents and nearby farms depend on wells for water. Contamination of groundwater aquifers would create both health and remediation concerns for local residents. Dye tests performed by the USGS near the area of proposed rezoning in Ranson have shown just how far-reaching groundwater contamination at the Ranson site could be. Results from the USGS study revealed measurable dye concentrations in Elk's Run, Rattlesnake Run, and even the Shepherdstown Town Run. This last run cuts through the center of Shepherdstown and is a favorite area for children to play and learn to fish.

Groundwater pollution is not the only concern for communities like Shepherdstown. The type of industry that ordinance #2017-302 would allow in Ranson would also generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. These pollutants are particularly harmful to children. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. The site in Ranson is across the road from an elementary school and also within the Jefferson High Middle district. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of children in Shepherdstown and all of Jefferson County.

I again request that you vote no on ordinance #2017-302. The long-term economic, environmental, and community health of municipalities like Shepherdstown depend on Ranson's participation in a coordinated zoning plan for all of Jefferson County.

Sincerely,

Katherine Simpson

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on #2017-302. The air emissions, possibility of ground and surface water contamination, and their effect on our interwoven economies threaten the health, safety and welfare of not just Jefferson County but the greater region, including Loudoun and the greater Northern Virginia area.

This zoning would provide for industry that produces large amounts of air emissions. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. Northern Virginia is directly downwind from these emissions. Much of the gaseous, fine particulate, and hazardous emissions can reach Northern Virginia. Further affecting the outdoor air quality of the adjacent portion of Virginia and the ability of these areas to achieve and maintain National Ambient Air Quality Standards (NAAQS) attainment. This will affect agriculture and outdoor leisure and recreation.

For example, Loudoun County has been in nonattainment for the NAAQS 8-hour Ozone standard for the past two years. VOC and NO_x react after they have been emitted to produce ground level ozone. The industry that this rezoning would provide for would produce large amounts of these emissions. This would make it even harder as Loudoun County tries to achieve attainment. As time goes on and the scientific research advances our knowledge and understanding of the extent to which gaseous, particulate and hazardous emissions affect human health the NAAQS standards are likely to be reduced. The effects on air emission from this rezoning will make it only harder for Loudoun and Northern Virginia to meet these standards.

In addition to the concerns about the air, the possible ground and surface water contamination is very concerning to Loudoun and Virginia residents. The site is known to have ground water that is vulnerable to contamination due to the karst hydrogeology. A USGS study demonstrated that the ground water adjacent to the site to be rezoned communicates readily with surface

water tributaries of the Potomac River. In addition to direct infiltration where water moves directly from the surface to groundwater via porous limestone bedrock, karst is known to have severe ground instability problems. This makes karst geology prone to sinkhole development. Sinkholes provide direct connection between the surface water and any contaminants it may contain and the groundwater. This makes the aquifer vulnerability in karst areas very high, and contamination with industrial activity such as that provided for by this rezoning too likely.

Loudoun sources its drinking water from the Potomac River, downstream of many West Virginia tributaries that carry water from the epikarst and groundwater aquifer at the site to be rezoned. Loudoun has recently completed the new Trap Rock Water Treatment facility, which draws water from the Potomac River. Loudoun currently provides 40 million gallons and projects to provide 90 million gallons of drinking water a day to customers by 2040 (Loudounwater.org). Therefore, the viability of the Potomac River is a high priority for Virginia residents.

Loudoun and Northern Virginia is one of the fastest growing communities in the country and provides a lot to Jefferson County in their symbiotic relationship. Virginia residents support and enjoy Jefferson County through tourism, as our residents enjoy the natural and historical resources of your county. Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that will significantly harm the municipalities within Jefferson County and beyond effecting the health, welfare, and safety of our community. Harpers Ferry is a national treasure with the natural and historic resources tours flock to see each year and one of the communities that will be negatively impacted by this zoning change.

According to a 2019 study by the West Virginia Tourism Office, Jefferson County generated and average of \$178 million per year in tourism-derived revenue for state and local governments over the last 10 years, more than any other county in West Virginia by at least double. Tourism benefits the businesses and economy of Ranson and Jefferson County producing \$213.7 million in individual earning, 7040 jobs, and \$842.6 million in direct spending here in 2018. We would need 40 Project Shuttles to replace the individual earnings and 59 Rockwools to replace the jobs provided by the tourism industry in Jefferson County. It is important to note that most of the money generated by tourism in Jefferson County comes from neighboring states. In this way it is like an export. Not simply recycling money but bringing money into the state increasing its wealth. Much of the economy in Harpers Ferry is based on this tourism industry. A threat to this industry poses a threat to the economy and welfare of our community.

One of the important drivers for tourism in Harpers Ferry is the Appalachian Trail. According to the Appalachian Trail Conservancy (ATC), Harpers Ferry is the psychologic midpoint of the Trail, and Hikers often plan extended stays in Jefferson County with an obvious positive impact. The ATC reports that the smokestacks and associated lights will be visible in the view shed of 15 vistas on the Appalachian Trail (AT). Studies have shown that quality of vistas and human impact on the environment are not only noticed by visitors but effect their experience. Another study published in the Journal of Applied Recreation Research, found that points of interests and views drew visitors' attention and had a significant impact on their perception of the trail. It was also found that particularly beautiful vistas helped visitors overlook elements that usually

have a negative effect on trail experience like increased trail traffic. A 2009 study in Leisure Sciences revealed that scenic value was a perceptual theme of Appalachian Trail visitors, and that things as simple as dead trees visible in a vista can have a negative impact on visitors overall perception. Imagine the effect the smokestacks will have from the 15 vistas from which they will be visible. The introduction of industrial activity made possible by the proposed rezoning in Ranson would have a negative effect on the scenic views of beautiful landscapes from the Appalachian Trail in Jefferson County.

The smokestacks are not all visitors will be able to see, the air pollution will create haze. The effect of regional haze on tourists was explored in a review article published in the *Atmospheric Environment* titled "Impaired visibility: the air pollution people see." A key takeaway on the negative affect of haze on vacationing tourists was summarized as follows: "Vacations offer an escape from the routine and stress of our daily lives. Vacation destinations are often chosen based on their scenery; vacations are spent gazing at monuments, mountains, clouds, and oceans. Good visibility allows clear observation of distant features and appreciation of the inherent beauty of these scenes...Air pollution, which is often present in both our cities and parks, interferes with these attributes and can ruin the views vacationers travel to enjoy." People seek bucolic, unspoiled areas to escape the stresses of urban areas. A 2004 study in *Environment and Behavior* found Perceived pollution causes stress while viewing natural scenes has both psychological and physiological benefits, and a 2007 study confirmed these benefits. Two other studies found that people are emotionally affected by poor visibility, and tourists are disappointed when views are obscured by haze. The combination of smokestacks and haze will mar the viewshed and will not only reduce the positive effects of a scenic landscape but also leave tourists disappointed and dissatisfied with their choice of destination. With these effects the welfare of the Harpers Ferry community would undoubtedly be endangered by the industry that this zoning change will provide for.

Multiple studies by doctors Kozar, Doctor, and Doctor have demonstrated that the land at this site to be rezoned is Karst with the highest likelihood of sinkhole development in the county, and that the ground water aquifer there is incredibly sensitive to contamination from surface water. Further, this site is on an upland plain with relatively few surface streams, seasonal variability in the water table that results in numerous estavelles, and large amounts of water in the epikarst. In this area contamination in surface water communicates easily to the water in the epikarst via diffuse and point infiltration, and the springs at the margins of the upland area are directly affected by the water quality throughout the aquifer. According to Jefferson Orchards Voluntary Remediation Plan with the WVDEP, the ground water at the site is approximately 60 feet below the ground, and die tests performed by the USGS have shown that ground water from just adjacent to this site emerged in the headwaters of both the Elk's Run and Rattlesnake Run. This is critically important for Harpers Ferry because the Elk's Run headwaters is a spring about three miles south east of the site and goes on to become the drinking water source for Harpers Ferry and Bolivar before emptying into the Potomac River. The headwaters of Rattlesnake Run is a spring about 3.5 miles from the site and is also a tributary of the Potomac River. The Potomac River is the back up water source for Harpers Ferry. This means that the activity at the site will have a critical influence on the drinking water

of Harpers Ferry. In this was the industry permitted by this change in zoning would undoubtedly endanger the health and safety of the community in Harpers Ferry.

The untoward health effects and individual economic consequences from the pollution emissions of the industry this rezoning will allow that will be born out over the length of peoples lives and that of their decedents for at least 3 generations is an egregious example of environmental injustice that should not be tolerated. This zoning change may be in one of the poorest sections of the county but the effects will be felt in every part of Ranson and the county.

The Comprehensive plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” The industry that this rezoning will allow will jeopardize the health, safety and welfare of Ranson, Harpers Ferry and the whole county. Please vote no on the ordinance #2017-302.

Sincerely,

Amy Barger

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. Heavy industry does not belong in Jefferson County. Our community health, livelihoods, water, and way of life would be put at risk if industrial zoning were to be allowed. As a resident of Jefferson County for over 24 years, I have grave concerns over how heavy industry pollution could impact our land, air, and water.

The type of industry that this ordinance would allow in Ranson would negatively affect tourism, economic agility, groundwater quality, and individual health in neighboring municipalities like Shepherdstown. Tourism is critically important to Shepherdstown's economy and to the county as a whole. In 2018, tourist spending in the Jefferson County contributed over \$170 million to state and local government revenue and \$213 million in individual earnings. Importantly, most of this money comes from tourists visiting from neighboring states like Virginia, Maryland, and Washington D.C.

Out-of-state tourists are largely drawn to Jefferson County because of its reputation for environmental-friendly, sustainable industry. Key elements that support this reputation include the county's pastoral scenery and pristine natural resources. Ordinance #2017-302 will allow industry into Jefferson County that risks harming these elements and dramatically reducing the area's appeal to visitors. The resulting harm to our tourist industry would drive away visitors and decrease state, county, and local revenue. The long-term success of Jefferson County's tourism industry is dependent on local governments making coordinated zoning decisions. Allowing certain types in industry in Ranson will negatively affect tourism in every municipality throughout the county, including Shepherdstown. Voting no on ordinance #2017-302 will protect the foundations of the county's tourism industry and protect the 7,040 jobs in Jefferson County that are directly supported by tourism.

Contamination of groundwater aquifers would create both health and remediation concerns for local residents. Dye tests performed by the USGS near the area of proposed rezoning in Ranson have shown just how far-reaching groundwater contamination at the Ranson site could be. Results from the USGS study revealed measurable dye concentrations in Elk's Run, Rattlesnake Run, and even the Shepherdstown Town Run. This last run cuts through the center of Shepherdstown and is a favorite area for children to play and learn to fish.

Groundwater pollution is not the only concern for communities like Shepherdstown. The type of industry that ordinance #2017-302 would allow in Ranson would also generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. These pollutants are particularly harmful to children. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. The site in Ranson is across the road from an elementary school and also within the Jefferson High Middle district. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of children in Shepherdstown and all of Jefferson County.

I again request that you vote no on ordinance #2017-302. The long-term economic, environmental, and community health of municipalities like Shepherdstown depend on Ranson's participation in a coordinated zoning plan for all of Jefferson County.

Sincerely,

Shannon Holliday
Shepherdstown, 25443

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would negatively affect tourism, economic agility, groundwater quality, and individual health in neighboring municipalities like Shepherdstown.

Tourism is critically important to Shepherdstown's economy and to the county as a whole. In 2018, tourist spending in the Jefferson County contributed over \$170 million to state and local government revenue and \$213 million in individual earnings. Importantly, most of this money comes from tourists visiting from neighboring states like Virginia, Maryland, and Washington D.C. Out-of-state tourists are largely drawn to Jefferson County because of its reputation for environmental-friendly, sustainable industry. Key elements that support this reputation include the county's pastoral scenery and pristine natural resources. Ordinance #2017-302 will allow industry into Jefferson County that risks harming these elements and dramatically reducing the area's appeal to visitors. The resulting harm to our tourist industry would drive away visitors and decrease state, county, and local revenue. The long-term success of Jefferson County's tourism industry is dependent on local governments making coordinated zoning decisions. Allowing certain types in industry in Ranson will negatively affect tourism in every municipality throughout the county, including Shepherdstown. Voting no on ordinance #2017-302 will protect the foundations of the county's tourism industry and protect the 7,040 jobs in Jefferson County that are directly supported by tourism.

The type of large, consolidated industry that ordinance #2017-302 would allow in Ranson would generally reduce the flexibility of local economies in Jefferson County. Historically, the driving industries in Jefferson County have been tourism, agriculture, and the equine industries. These three industries are large conglomerates of small businesses. Small business is very important to Sheherdstown. Small businesses have been shown to create more jobs, cultivate more innovation, and provide more opportunities than big, non-local firms. Additionally, small businesses have been shown to more reactive to sudden changes relative to manufacturing

businesses. Bringing large, manufacturing-based industry into Jefferson county will depress the local economy and stifle innovation. During this time of economic upheaval and uncertainty, Jefferson County needs to support industries that will allow local economies to adapt and recover as fast as possible.

Voting no on ordinance #2017-302 will help protect water resources throughout Jefferson County. The type of industry that ordinance #2017-302 would allow puts the ground resources of Jefferson county at significant risk due to the karst hydrogeology. The site in Ranson is in the Rocky Marsh Run watershed, which is in the source water protection zone for Shepherdstown and drains to the Potomac River. Therefore, activity at this site will affect both groundwater and surface water streams. In municipalities like Shepherdstown, many residents and nearby farms depend on wells for water. Contamination of groundwater aquifers would create both health and remediation concerns for local residents. Dye tests performed by the USGS near the area of proposed rezoning in Ranson have shown just how far-reaching groundwater contamination at the Ranson site could be. Results from the USGS study revealed measurable dye concentrations in Elk's Run, Rattlesnake Run, and even the Shepherdstown Town Run. This last run cuts through the center of Shepherdstown and is a favorite area for children to play and learn to fish.

Groundwater pollution is not the only concern for communities like Shepherdstown. The type of industry that ordinance #2017-302 would allow in Ranson would also generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. These pollutants are particularly harmful to children. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. The site in Ranson is across the road from an elementary school and also within the Jefferson High Middle district. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of children in Shepherdstown and all of Jefferson County.

I again request that you vote no on ordinance #2017-302. The long-term economic, environmental, and community health of municipalities like Shepherdstown depend on Ranson's participation in a coordinated zoning plan for all of Jefferson County.

Sincerely,

John Outen

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The city has failed to address the latter part of this objective. By Changing the SDI in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and child hood as development is exquisitely sensitive during these times, but the effects are realized through out life negatively impacting a variety of lifetime parameters including physical and mental health, and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over 70 million dollars in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and over all earnings. This industry would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitorship and again decreasing return on investment, cash flow, and over all earnings for the hundreds of small businesses that make up this industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the Karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive plan is clear the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Crystal Peace

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I am a native of Jefferson County and have contributed most of my adult life to work in public service supporting youth and families. I am currently a counselor and work with youth daily. I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would put at risk the health and well being of children of Jefferson County.

The type of industry that ordinance #2017-302 would allow in Ranson would generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. Exposure to these pollutants has devastating effects on children's health. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. Developing fetuses whose mothers are exposed to air pollution are more likely to have impaired organ development which can lead to early cognitive deficits, neurodevelopmental defects and other physical, cognitive, and psychological deficits later in life. An association between autism and prenatal exposure to particulate matter in air pollution has been demonstrated in several studies. Many studies have shown that lower test scores in math, English, and language arts are associated with exposure to outdoor air pollution. Industrial activity allowed by ordinance #2017-302 would also increase the risk of groundwater contamination in Ranson and nearby municipalities. Children whose families rely on well water, as is the case in much of Jefferson County, may be affected by polluted water. Voting no on ordinance #2017-302 will prevent air and water pollution from negatively affecting the long-term health of children in Jefferson County and surrounding areas.

The economic and environmental harm caused by the type of industry that ordinance #2017-302 would allow would put additional stress on the parents, caretakers, and teachers of children in affected areas. The weakening and destabilizing of this support network would have negative effects on local children. Many households in Jefferson County depend on the local agriculture, tourism, and equine industries for income. If industrial activity in Ranson depresses

these industries, the resulting financial strain on these households will introduce additional stress and uncertainty into children's lives. Households living in areas affected by particulate matter and regional haze will also suffer from the psychological effects of air pollution. Individuals living in areas with increase perception of pollution show increased levels of stress, anxiety, and unhappiness. School districts affected by increased air and water pollution may have trouble recruiting and retaining teachers. Teachers have a large influence on a child's daily life and, if educator quality and tenure decreases, the quality of this influence will diminish.

The site of the proposed rezoning in Ranson is across the road from an elementary school and proximal to lower-income neighborhoods. Observations like these demonstrate how ordinance #2017-302 would disproportionately affect vulnerable and historically-disadvantaged populations. The damaging health effects of air pollution have been shown to persist for at least three generations, so allowing certain types of industry in low-income areas would only compound existing disadvantages. Voting no on ordinance #2017-302 would be a step towards acknowledging that all individuals have the right to clean air and water.

As my children have asthma and so do many many in our county I am extremely concerned and will consider moving my home if this factory is to go through. It is known that Children face increased exposure to air pollution, groundwater contamination, financial instability, and environmental discrimination if ordinance #2017-302 is passed. Please vote no on ordinance #2017-302.

Sincerely,

Siri McDonald

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that will significantly harm the municipalities within Jefferson County and beyond effecting the health, welfare, and safety of our community. Harpers Ferry is a national treasure with the natural and historic resources tours flock to see each year and one of the communities that will be negatively impacted by this zoning change.

According to a 2019 study by the West Virginia Tourism Office, Jefferson County generated and average of \$178 million per year in tourism-derived revenue for state and local governments over the last 10 years, more than any other county in West Virginia by at least double. Tourism benefits the businesses and economy of Ranson and Jefferson County producing \$213.7 million in individual earning, 7040 jobs, and \$842.6 million in direct spending here in 2018. We would need 40 Project Shuttles to replace the individual earnings and 59 Rockwools to replace the jobs provided by the tourism industry in Jefferson County. It is important to note that most of the money generated by tourism in Jefferson County comes from neighboring states. In this way it is like an export. Not simply recycling money but bringing money into the state increasing its wealth. Much of the economy in Harpers Ferry is based on this tourism industry. A threat to this industry poses a threat to the economy and welfare of our community.

One of the important drivers for tourism in Harpers Ferry is the Appalachian Trail. According to the Appalachian Trail Conservancy (ATC), Harpers Ferry is the psychologic midpoint of the Trail, and Hikers often plan extended stays in Jefferson County with an obvious positive impact. The ATC reports that the smokestacks and associated lights will be visible in the view shed of 15 vistas on the Appalachian Trail (AT). Studies have shown that quality of vistas and human impact on the environment are not only noticed by visitors but effect their experience. Another study published in the Journal of Applied Recreation Research, found that points of interests and views drew visitors' attention and had a significant impact on their perception of the trail. It was also found that particularly beautiful vistas helped visitors overlook elements that usually

have a negative effect on trail experience like increased trail traffic. A 2009 study in Leisure Sciences revealed that scenic value was a perceptual theme of Appalachian Trail visitors, and that things as simple as dead trees visible in a vista can have a negative impact on visitors overall perception. Imagine the effect the smokestacks will have from the 15 vistas from which they will be visible. The introduction of industrial activity made possible by the proposed rezoning in Ranson would have a negative effect on the scenic views of beautiful landscapes from the Appalachian Trail in Jefferson County.

The smokestacks are not all visitors will be able to see, the air pollution will create haze. The effect of regional haze on tourists was explored in a review article published in the *Atmospheric Environment* titled "Impaired visibility: the air pollution people see." A key takeaway on the negative affect of haze on vacationing tourists was summarized as follows: "Vacations offer an escape from the routine and stress of our daily lives. Vacation destinations are often chosen based on their scenery; vacations are spent gazing at monuments, mountains, clouds, and oceans. Good visibility allows clear observation of distant features and appreciation of the inherent beauty of these scenes...Air pollution, which is often present in both our cities and parks, interferes with these attributes and can ruin the views vacationers travel to enjoy." People seek bucolic, unspoiled areas to escape the stresses of urban areas. A 2004 study in *Environment and Behavior* found Perceived pollution causes stress while viewing natural scenes has both psychological and physiological benefits, and a 2007 study confirmed these benefits. Two other studies found that people are emotionally affected by poor visibility, and tourists are disappointed when views are obscured by haze. The combination of smokestacks and haze will mar the viewshed and will not only reduce the positive effects of a scenic landscape but also leave tourists disappointed and dissatisfied with their choice of destination. With these effects the welfare of the Harpers Ferry community would undoubtedly be endangered by the industry that this zoning change will provide for.

Multiple studies by doctors Kozar, Doctor, and Doctor have demonstrated that the land at this site to be rezoned is Karst with the highest likelihood of sinkhole development in the county, and that the ground water aquifer there is incredibly sensitive to contamination from surface water. Further, this site is on an upland plain with relatively few surface streams, seasonal variability in the water table that results in numerous estavelles, and large amounts of water in the epikarst. In this area contamination in surface water communicates easily to the water in the epikarst via diffuse and point infiltration, and the springs at the margins of the upland area are directly affected by the water quality throughout the aquifer. According to Jefferson Orchards Voluntary Remediation Plan with the WVDEP, the ground water at the site is approximately 60 feet below the ground, and the tests performed by the USGS have shown that ground water from just adjacent to this site emerged in the headwaters of both the Elk's Run and Rattlesnake Run. This is critically important for Harpers Ferry because the Elk's Run headwaters is a spring about three miles south east of the site and goes on to become the drinking water source for Harpers Ferry and Bolivar before emptying into the Potomac River. The headwaters of Rattlesnake Run is a spring about 3.5 miles from the site and is also a tributary of the Potomac River. The Potomac River is the back up water source for Harpers Ferry. This means that the activity at the site will have a critical influence on the drinking water

of Harpers Ferry. In this was the industry permitted by this change in zoning would undoubtedly endanger the health and safety of the community in Harpers Ferry.

The untoward health effects and individual economic consequences from the pollution emissions of the industry this rezoning will allow that will be born out over the length of peoples lives and that of their decedents for at least 3 generations is an egregious example of environmental injustice that should not be tolerated. This zoning change may be in one of the poorest sections of the county but the effects will be felt in every part of Ranson and the county.

The Comprehensive plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” The industry that this rezoning will allow will jeopardize the health, safety and welfare of Ranson, Harpers Ferry and the whole county. Please vote no on the ordinance #2017-302.

Sincerely,

Connor Gibbons

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

I believe the previous plan for the site, studied and planned for many years by the previous mayor, should be the plan for this Jefferson orchards site. There is no way that the measly number of jobs planned for by the Danish interloper can compensate for the harm done to our local economy by the destruction of our environment and the invaluable historic nature of Jefferson County.

Sincerely,

Bruce Appelgren

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. The proposed rezoning Would be detrimental to our county; our environment, our people, our children, our animals, and all of their health and futures here in this county.

This Ordinance would allow industry in Ranson that will significantly harm the municipalities within Jefferson County and beyond effecting the health, welfare, and safety of our community. Harpers Ferry is a national treasure with the natural and historic resources tours flock to see each year and one of the communities that will be negatively impacted by this zoning change.

According to a 2019 study by the West Virginia Tourism Office, Jefferson County generated an average of \$178 million per year in tourism-derived revenue for state and local governments over the last 10 years, more than any other county in West Virginia by at least double. Tourism benefits the businesses and economy of Ranson and Jefferson County producing \$213.7 million in individual earning, 7040 jobs, and \$842.6 million in direct spending here in 2018. We would need 40 Project Shuttles to replace the individual earnings and 59 Rockwools to replace the jobs provided by the tourism industry in Jefferson County. It is important to note that most of the money generated by tourism in Jefferson County comes from neighboring states. In this way, it is like an export: not simply recycling money, but bringing money into the state increasing its wealth. Much of the economy in Harpers Ferry is based on this tourism industry. A threat to this industry poses a threat to the economy and welfare of our community.

One of the important drivers for tourism in Harpers Ferry is the Appalachian Trail. According to the Appalachian Trail Conservancy (ATC), Harpers Ferry is the psychologic midpoint of the Trail, and hikers often plan extended stays in Jefferson County with an obvious positive impact. The ATC reports that the smokestacks and associated lights will be visible in the viewshed of 15 vistas on the Appalachian Trail (AT). Studies have shown that quality of vistas and human impact on the environment are not only noticed by visitors, but effect their experience.

Another study published in the Journal of Applied Recreation Research, found that points of interests and views drew visitors' attention and had a significant impact on their perception of the trail. It was also found that particularly beautiful vistas helped visitors overlook elements that usually have a negative effect on trail experience like increased trail traffic. A 2009 study in Leisure Sciences revealed that scenic value was a perceptual theme of Appalachian Trail visitors, and that things as simple as dead trees visible in a vista can have a negative impact on visitors' overall perception. Imagine the effect the smokestacks will have from the 15 vistas from which they will be visible. The introduction of industrial activity made possible by the proposed rezoning in Ranson would have a negative effect on the scenic views of beautiful landscapes from the Appalachian Trail in Jefferson County.

The smokestacks are not all visitors will be able to see — the air pollution will create haze. The effect of regional haze on tourists was explored in a review article published in the Atmospheric Environment titled "Impaired visibility: the air pollution people see." A key takeaway on the negative affect of haze on vacationing tourists was summarized as follows:

"Vacations offer an escape from the routine and stress of our daily lives. Vacation destinations are often chosen based on their scenery; vacations are spent gazing at monuments, mountains, clouds, and oceans. Good visibility allows clear observation of distant features and appreciation of the inherent beauty of these scenes...Air pollution, which is often present in both our cities and parks, interferes with these attributes and can ruin the views vacationers travel to enjoy."

People seek bucolic, unspoiled areas to escape the stresses of urban areas. A 2004 study in Environment and Behavior found perceived pollution causes stress while viewing natural scenes has both psychological and physiological benefits, and a 2007 study confirmed these benefits. Two other studies found that people are emotionally affected by poor visibility, and tourists are disappointed when views are obscured by haze.

The combination of smokestacks and haze will mar the viewshed and will not only reduce the positive effects of a scenic landscape but also leave tourists disappointed and dissatisfied with their choice of destination. With these effects the welfare of the Harpers Ferry community would undoubtedly be endangered by the industry that this zoning change will provide for.

Multiple studies by doctors Kozar, Doctor, and Doctor have demonstrated that the land at this site to be rezoned is Karst with the highest likelihood of sinkhole development in the county, and that the groundwater aquifer there is incredibly sensitive to contamination from surface water. Further, this site is on an upland plain with relatively few surface streams, seasonal variability in the water table that results in numerous estavelles, and large amounts of water in the epikarst. In this area contamination in surface water communicates easily to the water in the epikarst via diffuse and point infiltration, and the springs at the margins of the upland area are directly affected by the water quality throughout the aquifer. According to Jefferson Orchards Voluntary Remediation Plan with the WVDEP, the groundwater at the site is approximately 60 feet below the ground, and die tests performed by the USGS have shown that groundwater from just adjacent to this site emerged in the headwaters of both the Elk's Run

and Rattlesnake Run. This is critically important for Harpers Ferry because the Elk's Run headwaters is a spring about three miles southeast of the site and goes on to become the drinking water source for Harpers Ferry and Bolivar before emptying into the Potomac River. The headwaters of Rattlesnake Run is a spring about 3.5 miles from the site and is also a tributary of the Potomac River. The Potomac River is the back up water source for Harpers Ferry. This means that the activity at the site will have a critical influence on the drinking water of Harpers Ferry. In this was the industry permitted by this change in zoning would undoubtedly endanger the health and safety of the community in Harpers Ferry.

The untoward health effects and individual economic consequences from the pollution emissions of the industry this rezoning will allow that will be born out over the length of people's lives and that of their decedents for at least three generations is an egregious example of environmental injustice that should not be tolerated. This zoning change may be in one of the poorest sections of the county, but the effects will be felt in every part of Ranson and the county.

The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." The industry that this rezoning will allow will jeopardize the health, safety and welfare of Ranson, Harpers Ferry and the whole county. Please vote no on the ordinance #2017-302.

Sincerely,

Holly N Korzilius
Harpers Ferry, 25425

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

As a neighbor of yours who enjoys time spent in Jefferson County, I am asking that you please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition. I am particularly concerned about the welfare of the students in the Title I school which is so approximate to the proposed plant. When driving in front of the school, I can see how close the proposed plant is. I am also concerned about leakage from the storage wells that are lined with plastic and sit on the land that is characterized by characteristics of Karst Geology. I get all my water from my well here in Hedgesville. I would be very concerned if I lived in the area of the proposed plant of leakage from those storage wells.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects

have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Maggie Loudon

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would negatively affect tourism, economic agility, groundwater quality, and individual health in neighboring municipalities like Shepherdstown.

Tourism is critically important to Shepherdstown's economy and to the county as a whole. In 2018, tourist spending in the Jefferson County contributed over \$170 million to state and local government revenue and \$213 million in individual earnings. Importantly, most of this money comes from tourists visiting from neighboring states like Virginia, Maryland, and Washington D.C. Out-of-state tourists are largely drawn to Jefferson County because of its reputation for environmental-friendly, sustainable industry. Key elements that support this reputation include the county's pastoral scenery and pristine natural resources. Ordinance #2017-302 will allow industry into Jefferson County that risks harming these elements and dramatically reducing the area's appeal to visitors. The resulting harm to our tourist industry would drive away visitors and decrease state, county, and local revenue. The long-term success of Jefferson County's tourism industry is dependent on local governments making coordinated zoning decisions. Allowing certain types in industry in Ranson will negatively affect tourism in every municipality throughout the county, including Shepherdstown. Voting no on ordinance #2017-302 will protect the foundations of the county's tourism industry and protect the 7,040 jobs in Jefferson County that are directly supported by tourism.

The type of large, consolidated industry that ordinance #2017-302 would allow in Ranson would generally reduce the flexibility of local economies in Jefferson County. Historically, the driving industries in Jefferson County have been tourism, agriculture, and the equine industries. These three industries are large conglomerates of small businesses. Small business is very important to Sheherdstown. Small businesses have been shown to create more jobs, cultivate more innovation, and provide more opportunities than big, non-local firms. Additionally, small businesses have been shown to more reactive to sudden changes relative to manufacturing

businesses. Bringing large, manufacturing-based industry into Jefferson county will depress the local economy and stifle innovation. During this time of economic upheaval and uncertainty, Jefferson County needs to support industries that will allow local economies to adapt and recover as fast as possible.

Voting no on ordinance #2017-302 will help protect water resources throughout Jefferson County. The type of industry that ordinance #2017-302 would allow puts the ground resources of Jefferson county at significant risk due to the karst hydrogeology. The site in Ranson is in the Rocky Marsh Run watershed, which is in the source water protection zone for Shepherdstown and drains to the Potomac River. Therefore, activity at this site will affect both groundwater and surface water streams. In municipalities like Shepherdstown, many residents and nearby farms depend on wells for water. Contamination of groundwater aquifers would create both health and remediation concerns for local residents. Dye tests performed by the USGS near the area of proposed rezoning in Ranson have shown just how far-reaching groundwater contamination at the Ranson site could be. Results from the USGS study revealed measurable dye concentrations in Elk's Run, Rattlesnake Run, and even the Shepherdstown Town Run. This last run cuts through the center of Shepherdstown and is a favorite area for children to play and learn to fish.

The only question is WHEN the water supply will be contaminated - not if.

Groundwater pollution is not the only concern for communities like Shepherdstown. The type of industry that ordinance #2017-302 would allow in Ranson would also generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. These pollutants are particularly harmful to children. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. The site in Ranson is across the road from an elementary school and also within the Jefferson High Middle district. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of children in Shepherdstown and all of Jefferson County.

I again request that you vote no on ordinance #2017-302. The long-term economic, environmental, and community health of municipalities like Shepherdstown depend on Ranson's participation in a coordinated zoning plan for all of Jefferson County.

Sincerely,

William Telfair

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The city has failed to address the latter part of this objective. By Changing the SDI in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and child hood as development is exquisitely sensitive during these times, but the effects are realized through out life negatively impacting a variety of lifetime parameters including physical and mental health, and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over 70 million dollars in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and over all earnings. This industry would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitorship and again decreasing return on investment, cash flow, and over all earnings for the hundreds of small businesses that make up this industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the Karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive plan is clear the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Christine Puttock

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would negatively affect tourism, economic agility, groundwater quality, and individual health in neighboring municipalities like Shepherdstown.

Tourism is critically important to Shepherdstown's economy and to the county as a whole. In 2018, tourist spending in the Jefferson County contributed over \$170 million to state and local government revenue and \$213 million in individual earnings. Importantly, most of this money comes from tourists visiting from neighboring states like Virginia, Maryland, and Washington D.C. Out-of-state tourists are largely drawn to Jefferson County because of its reputation for environmental-friendly, sustainable industry. Key elements that support this reputation include the county's pastoral scenery and pristine natural resources. Ordinance #2017-302 will allow industry into Jefferson County that risks harming these elements and dramatically reducing the area's appeal to visitors. The resulting harm to our tourist industry would drive away visitors and decrease state, county, and local revenue. The long-term success of Jefferson County's tourism industry is dependent on local governments making coordinated zoning decisions. Allowing certain types in industry in Ranson will negatively affect tourism in every municipality throughout the county, including Shepherdstown. Voting no on ordinance #2017-302 will protect the foundations of the county's tourism industry and protect the 7,040 jobs in Jefferson County that are directly supported by tourism.

The type of large, consolidated industry that ordinance #2017-302 would allow in Ranson would generally reduce the flexibility of local economies in Jefferson County. Historically, the driving industries in Jefferson County have been tourism, agriculture, and the equine industries. These three industries are large conglomerates of small businesses. Small business is very important to Sheherdstown. Small businesses have been shown to create more jobs, cultivate more innovation, and provide more opportunities than big, non-local firms. Additionally, small businesses have been shown to more reactive to sudden changes relative to manufacturing

businesses. Bringing large, manufacturing-based industry into Jefferson county will depress the local economy and stifle innovation. During this time of economic upheaval and uncertainty, Jefferson County needs to support industries that will allow local economies to adapt and recover as fast as possible.

Voting no on ordinance #2017-302 will help protect water resources throughout Jefferson County. The type of industry that ordinance #2017-302 would allow puts the ground resources of Jefferson county at significant risk due to the karst hydrogeology. The site in Ranson is in the Rocky Marsh Run watershed, which is in the source water protection zone for Shepherdstown and drains to the Potomac River. Therefore, activity at this site will affect both groundwater and surface water streams. In municipalities like Shepherdstown, many residents and nearby farms depend on wells for water. Contamination of groundwater aquifers would create both health and remediation concerns for local residents. Dye tests performed by the USGS near the area of proposed rezoning in Ranson have shown just how far-reaching groundwater contamination at the Ranson site could be. Results from the USGS study revealed measurable dye concentrations in Elk's Run, Rattlesnake Run, and even the Shepherdstown Town Run. This last run cuts through the center of Shepherdstown and is a favorite area for children to play and learn to fish.

Groundwater pollution is not the only concern for communities like Shepherdstown. The type of industry that ordinance #2017-302 would allow in Ranson would also generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. These pollutants are particularly harmful to children. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. The site in Ranson is across the road from an elementary school and also within the Jefferson High Middle district. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of children in Shepherdstown and all of Jefferson County.

I again request that you vote no on ordinance #2017-302. The long-term economic, environmental, and community health of municipalities like Shepherdstown depend on Ranson's participation in a coordinated zoning plan for all of Jefferson County.

Sincerely,

Kristina Billings

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The city has failed to address the latter part of this objective. By Changing the SDI in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and child hood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health, and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and overall earnings for owners, breeders, and

trainers. This group provides over 70 million dollars in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. This industry would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitorship and again decreasing return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up this industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the Karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive plan is clear the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Georgia Cullum

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that will significantly harm the municipalities within Jefferson County and beyond effecting the health, welfare, and safety of our community. Harpers Ferry is a national treasure with the natural and historic resources tours flock to see each year and one of the communities that will be negatively impacted by this zoning change.

According to a 2019 study by the West Virginia Tourism Office, Jefferson County generated and average of \$178 million per year in tourism-derived revenue for state and local governments over the last 10 years, more than any other county in West Virginia by at least double. Tourism benefits the businesses and economy of Ranson and Jefferson County producing \$213.7 million in individual earning, 7040 jobs, and \$842.6 million in direct spending here in 2018. We would need 40 Project Shuttles to replace the individual earnings and 59 Rockwools to replace the jobs provided by the tourism industry in Jefferson County. It is important to note that most of the money generated by tourism in Jefferson County comes from neighboring states. In this way it is like an export. Not simply recycling money but bringing money into the state increasing its wealth. Much of the economy in Harpers Ferry is based on this tourism industry. A threat to this industry poses a threat to the economy and welfare of our community.

One of the important drivers for tourism in Harpers Ferry is the Appalachian Trail. According to the Appalachian Trail Conservancy (ATC), Harpers Ferry is the psychologic midpoint of the Trail, and Hikers often plan extended stays in Jefferson County with an obvious positive impact. The ATC reports that the smokestacks and associated lights will be visible in the view shed of 15 vistas on the Appalachian Trail (AT). Studies have shown that quality of vistas and human impact on the environment are not only noticed by visitors but effect their experience. Another study published in the Journal of Applied Recreation Research, found that points of interests and views drew visitors' attention and had a significant impact on their perception of the trail. It was also found that particularly beautiful vistas helped visitors overlook elements that usually

have a negative effect on trail experience like increased trail traffic. A 2009 study in Leisure Sciences revealed that scenic value was a perceptual theme of Appalachian Trail visitors, and that things as simple as dead trees visible in a vista can have a negative impact on visitors overall perception. Imagine the effect the smokestacks will have from the 15 vistas from which they will be visible. The introduction of industrial activity made possible by the proposed rezoning in Ranson would have a negative effect on the scenic views of beautiful landscapes from the Appalachian Trail in Jefferson County.

The smokestacks are not all visitors will be able to see, the air pollution will create haze. The effect of regional haze on tourists was explored in a review article published in the *Atmospheric Environment* titled "Impaired visibility: the air pollution people see." A key takeaway on the negative affect of haze on vacationing tourists was summarized as follows: "Vacations offer an escape from the routine and stress of our daily lives. Vacation destinations are often chosen based on their scenery; vacations are spent gazing at monuments, mountains, clouds, and oceans. Good visibility allows clear observation of distant features and appreciation of the inherent beauty of these scenes...Air pollution, which is often present in both our cities and parks, interferes with these attributes and can ruin the views vacationers travel to enjoy." People seek bucolic, unspoiled areas to escape the stresses of urban areas. A 2004 study in *Environment and Behavior* found Perceived pollution causes stress while viewing natural scenes has both psychological and physiological benefits, and a 2007 study confirmed these benefits. Two other studies found that people are emotionally affected by poor visibility, and tourists are disappointed when views are obscured by haze. The combination of smokestacks and haze will mar the viewshed and will not only reduce the positive effects of a scenic landscape but also leave tourists disappointed and dissatisfied with their choice of destination. With these effects the welfare of the Harpers Ferry community would undoubtedly be endangered by the industry that this zoning change will provide for.

Multiple studies by doctors Kozar, Doctor, and Doctor have demonstrated that the land at this site to be rezoned is Karst with the highest likelihood of sinkhole development in the county, and that the ground water aquifer there is incredibly sensitive to contamination from surface water. Further, this site is on an upland plain with relatively few surface streams, seasonal variability in the water table that results in numerous estavelles, and large amounts of water in the epikarst. In this area contamination in surface water communicates easily to the water in the epikarst via diffuse and point infiltration, and the springs at the margins of the upland area are directly affected by the water quality throughout the aquifer. According to Jefferson Orchards Voluntary Remediation Plan with the WVDEP, the ground water at the site is approximately 60 feet below the ground, and the tests performed by the USGS have shown that ground water from just adjacent to this site emerged in the headwaters of both the Elk's Run and Rattlesnake Run. This is critically important for Harpers Ferry because the Elk's Run headwaters is a spring about three miles south east of the site and goes on to become the drinking water source for Harpers Ferry and Bolivar before emptying into the Potomac River. The headwaters of Rattlesnake Run is a spring about 3.5 miles from the site and is also a tributary of the Potomac River. The Potomac River is the back up water source for Harpers Ferry. This means that the activity at the site will have a critical influence on the drinking water

of Harpers Ferry. In this was the industry permitted by this change in zoning would undoubtedly endanger the health and safety of the community in Harpers Ferry.

The untoward health effects and individual economic consequences from the pollution emissions of the industry this rezoning will allow that will be born out over the length of peoples lives and that of their decedents for at least 3 generations is an egregious example of environmental injustice that should not be tolerated. This zoning change may be in one of the poorest sections of the county but the effects will be felt in every part of Ranson and the county.

The Comprehensive plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” The industry that this rezoning will allow will jeopardize the health, safety and welfare of Ranson, Harpers Ferry and the whole county. Please vote no on the ordinance #2017-302.

Sincerely,

Tori K

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on #2017-302. The air emissions, possibility of ground and surface water contamination, and their effect on our interwoven economies threaten the health, safety and welfare of not just Jefferson County but the greater region, including Loudoun and the greater Northern Virginia area.

This zoning would provide for industry that produces large amounts of air emissions. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. Northern Virginia is directly downwind from these emissions. Much of the gaseous, fine particulate, and hazardous emissions can reach Northern Virginia. Further affecting the outdoor air quality of the adjacent portion of Virginia and the ability of these areas to achieve and maintain National Ambient Air Quality Standards (NAAQS) attainment. This will affect agriculture and outdoor leisure and recreation.

For example, Loudoun County has been in nonattainment for the NAAQS 8-hour Ozone standard for the past two years. VOC and NO_x react after they have been emitted to produce ground level ozone. The industry that this rezoning would provide for would produce large amounts of these emissions. This would make it even harder as Loudoun County tries to achieve attainment. As time goes on and the scientific research advances our knowledge and understanding of the extent to which gaseous, particulate and hazardous emissions affect human health the NAAQS standards are likely to be reduced. The effects on air emission from this rezoning will make it only harder for Loudoun and Northern Virginia to meet these standards.

In addition to the concerns about the air, the possible ground and surface water contamination is very concerning to Loudoun and Virginia residents. The site is known to have ground water that is vulnerable to contamination due to the karst hydrogeology. A USGS study demonstrated that the ground water adjacent to the site to be rezoned communicates readily with surface

water tributaries of the Potomac River. In addition to direct infiltration where water moves directly from the surface to groundwater via porous limestone bedrock, karst is known to have severe ground instability problems. This makes karst geology prone to sinkhole development. Sinkholes provide direct connection between the surface water and any contaminants it may contain and the groundwater. This makes the aquifer vulnerability in karst areas very high, and contamination with industrial activity such as that provided for by this rezoning too likely.

Loudoun sources its drinking water from the Potomac River, downstream of many West Virginia tributaries that carry water from the epikarst and groundwater aquifer at the site to be rezoned. Loudoun has recently completed the new Trap Rock Water Treatment facility, which draws water from the Potomac River. Loudoun currently provides 40 million gallons and projects to provide 90 million gallons of drinking water a day to customers by 2040 (Loudounwater.org). Therefore, the viability of the Potomac River is a high priority for Virginia residents.

Loudoun and Northern Virginia is one of the fastest growing communities in the country and provides a lot to Jefferson County in their symbiotic relationship. Virginia residents support and enjoy Jefferson County through tourism, as our residents enjoy the natural and historical resources of your county. Virginia residents and businesses support the equine industry in a multitude of ways from providing wagering fans at the races to the Virginia Breeders Association Virginia Certified incentive programs and a strong market for retired racehorses. According to an economic impact study from WVU, at least 40% of Jefferson County residents travel outside of West Virginia for work, a good percentage of those travel to northern Virginia. This rezoning would allow for industry that would negatively affect the economy of both places and this relationship and the benefits for our residents gleaned from it.

This zoning change will provide for industry that will negatively effect the health safety and welfare of the Loudon and Northern Virginia community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

We would need 40 Project Shuttles to replace the individual earnings and 59 Rockwools to replace the jobs provided by the tourism industry in Jefferson County. It is important to note that most of the money generated by tourism in Jefferson County comes from neighboring states. In this way it is like an export. Not simply recycling money but bringing money into the state increasing its wealth. Much of the economy in Harpers Ferry is based on this tourism industry. A threat to this industry poses a threat to the economy and welfare of our community.

One of the important drivers for tourism in Harpers Ferry is the Appalachian Trail. According to the Appalachian Trail Conservancy (ATC), Harpers Ferry is the psychologic midpoint of the Trail, and Hikers often plan extended stays in Jefferson County with an obvious positive impact. The ATC reports that the smokestacks and associated lights will be visible in the view shed of 15 vistas on the Appalachian Trail (AT). Studies have shown that quality of vistas and human impact on the environment are not only noticed by visitors but effect their experience. Another study published in the Journal of Applied Recreation Research, found that points of interests and views drew visitors' attention and had a significant impact on their perception of the trail. It was also found that particularly beautiful vistas helped visitors overlook elements that usually

have a negative effect on trail experience like increased trail traffic. A 2009 study in Leisure Sciences revealed that scenic value was a perceptual theme of Appalachian Trail visitors, and that things as simple as dead trees visible in a vista can have a negative impact on visitors overall perception. Imagine the effect the smokestacks will have from the 15 vistas from which they will be visible. The introduction of industrial activity made possible by the proposed rezoning in Ranson would have a negative effect on the scenic views of beautiful landscapes from the Appalachian Trail in Jefferson County.

The smokestacks are not all visitors will be able to see, the air pollution will create haze. The effect of regional haze on tourists was explored in a review article published in the *Atmospheric Environment* titled "Impaired visibility: the air pollution people see." A key takeaway on the negative affect of haze on vacationing tourists was summarized as follows: "Vacations offer an escape from the routine and stress of our daily lives. Vacation destinations are often chosen based on their scenery; vacations are spent gazing at monuments, mountains, clouds, and oceans. Good visibility allows clear observation of distant features and appreciation of the inherent beauty of these scenes...Air pollution, which is often present in both our cities and parks, interferes with these attributes and can ruin the views vacationers travel to enjoy." People seek bucolic, unspoiled areas to escape the stresses of urban areas. A 2004 study in *Environment and Behavior* found Perceived pollution causes stress while viewing natural scenes has both psychological and physiological benefits, and a 2007 study confirmed these benefits. Two other studies found that people are emotionally affected by poor visibility, and tourists are disappointed when views are obscured by haze. The combination of smokestacks and haze will mar the viewshed and will not only reduce the positive effects of a scenic landscape but also leave tourists disappointed and dissatisfied with their choice of destination. With these effects the welfare of the Harpers Ferry community would undoubtedly be endangered by the industry that this zoning change will provide for.

Multiple studies by doctors Kozar, Doctor, and Doctor have demonstrated that the land at this site to be rezoned is Karst with the highest likelihood of sinkhole development in the county, and that the ground water aquifer there is incredibly sensitive to contamination from surface water. Further, this site is on an upland plain with relatively few surface streams, seasonal variability in the water table that results in numerous estavelles, and large amounts of water in the epikarst. In this area contamination in surface water communicates easily to the water in the epikarst via diffuse and point infiltration, and the springs at the margins of the upland area are directly affected by the water quality throughout the aquifer. According to Jefferson Orchards Voluntary Remediation Plan with the WVDEP, the ground water at the site is approximately 60 feet below the ground, and die tests performed by the USGS have shown that ground water from just adjacent to this site emerged in the headwaters of both the Elk's Run and Rattlesnake Run. This is critically important for Harpers Ferry because the Elk's Run headwaters is a spring about three miles south east of the site and goes on to become the drinking water source for Harpers Ferry and Bolivar before emptying into the Potomac River. The headwaters of Rattlesnake Run is a spring about 3.5 miles from the site and is also a tributary of the Potomac River. The Potomac River is the back up water source for Harpers Ferry. This means that the activity at the site will have a critical influence on the drinking water

of Harpers Ferry. In this was the industry permitted by this change in zoning would undoubtedly endanger the health and safety of the community in Harpers Ferry.

The untoward health effects and individual economic consequences from the pollution emissions of the industry this rezoning will allow that will be born out over the length of peoples lives and that of their decedents for at least 3 generations is an egregious example of environmental injustice that should not be tolerated. This zoning change may be in one of the poorest sections of the county but the effects will be felt in every part of Ranson and the county.

The Comprehensive plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” The industry that this rezoning will allow will jeopardize the health, safety and welfare of Ranson, Harpers Ferry and the whole county. Please vote no on the ordinance #2017-302.

Sincerely,

Steven Rozier
Harpers Ferry, 25425

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Jackie Jury

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would negatively affect tourism, economic agility, groundwater quality, and individual health in neighboring municipalities like Shepherdstown.

Tourism is critically important to Shepherdstown's economy and to the county as a whole. In 2018, tourist spending in the Jefferson County contributed over \$170 million to state and local government revenue and \$213 million in individual earnings. Importantly, most of this money comes from tourists visiting from neighboring states like Virginia, Maryland, and Washington D.C. Out-of-state tourists are largely drawn to Jefferson County because of its reputation for environmental-friendly, sustainable industry. Key elements that support this reputation include the county's pastoral scenery and pristine natural resources. Ordinance #2017-302 will allow industry into Jefferson County that risks harming these elements and dramatically reducing the area's appeal to visitors. The resulting harm to our tourist industry would drive away visitors and decrease state, county, and local revenue. The long-term success of Jefferson County's tourism industry is dependent on local governments making coordinated zoning decisions. Allowing certain types in industry in Ranson will negatively affect tourism in every municipality throughout the county, including Shepherdstown. Voting no on ordinance #2017-302 will protect the foundations of the county's tourism industry and protect the 7,040 jobs in Jefferson County that are directly supported by tourism.

The type of large, consolidated industry that ordinance #2017-302 would allow in Ranson would generally reduce the flexibility of local economies in Jefferson County. Historically, the driving industries in Jefferson County have been tourism, agriculture, and the equine industries. These three industries are large conglomerates of small businesses. Small business is very important to Sheherdstown. Small businesses have been shown to create more jobs, cultivate more innovation, and provide more opportunities than big, non-local firms. Additionally, small businesses have been shown to more reactive to sudden changes relative to manufacturing

businesses. Bringing large, manufacturing-based industry into Jefferson county will depress the local economy and stifle innovation. During this time of economic upheaval and uncertainty, Jefferson County needs to support industries that will allow local economies to adapt and recover as fast as possible.

Voting no on ordinance #2017-302 will help protect water resources throughout Jefferson County. The type of industry that ordinance #2017-302 would allow puts the ground resources of Jefferson county at significant risk due to the karst hydrogeology. The site in Ranson is in the Rocky Marsh Run watershed, which is in the source water protection zone for Shepherdstown and drains to the Potomac River. Therefore, activity at this site will affect both groundwater and surface water streams. In municipalities like Shepherdstown, many residents and nearby farms depend on wells for water. Contamination of groundwater aquifers would create both health and remediation concerns for local residents. Dye tests performed by the USGS near the area of proposed rezoning in Ranson have shown just how far-reaching groundwater contamination at the Ranson site could be. Results from the USGS study revealed measurable dye concentrations in Elk's Run, Rattlesnake Run, and even the Shepherdstown Town Run. This last run cuts through the center of Shepherdstown and is a favorite area for children to play and learn to fish.

Groundwater pollution is not the only concern for communities like Shepherdstown. The type of industry that ordinance #2017-302 would allow in Ranson would also generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. These pollutants are particularly harmful to children. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. The site in Ranson is across the road from an elementary school and also within the Jefferson High Middle district. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of children in Shepherdstown and all of Jefferson County.

I again request that you vote no on ordinance #2017-302. The long-term economic, environmental, and community health of municipalities like Shepherdstown depend on Ranson's participation in a coordinated zoning plan for all of Jefferson County.

Sincerely,

Matthew Bachtell
Shepherdstown, 25443

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask that you vote no on Ordinance #2017-302. While not in Ranson, the land and homes around the property that is the subject of the zoning change are closer to the property than anyone who currently lives within the city limits of Ranson. This area will be affected sooner and more harshly by the environmental issues that will develop secondary to the inappropriate siting of industry this zoning would allow.

The subject land has been well studied by Drs. Kozar, Doctor and Doctor and described in the scientific literature and USGS reports as having karst hydrology with very high aquifer vulnerability. The karst landscape is a consequence of the presence of soluble bedrock, which consists of limestone in the case of the subject land. In such landscapes water percolates through the ground and dissolves the underlying rock creating a porous network of caverns and throughways. Karst aquifers are known to be "extremely vulnerable to pollution" due to direct connection between the surface water and groundwater through both point (sinkholes) and diffuse (everywhere) infiltration. It is known from the Voluntary Remediation Plan of Jefferson Orchard that the groundwater at the subject site is only 60 feet below the ground. The subject property and much of the property around it are on an upland plain with few surface streams, but great seasonal variability in the water table resulting in numerous esteves and large amounts of water in the epikarst. This water is easily contaminated and this contamination spreads quickly throughout the aquifer. Dye tests performed near the subject site by the USGS have demonstrated this quick moving thorough dispersment in the aquifer in this area. While this contamination goes on to affect springs at the margins of the upland area continuing on in streams that service municipal water sources and the Potomac River, our concerns are far more immediate in both time and distance. Well water is the only water source available in the area of the proposed zoning change and, with the exception of Fox Glen, a majority of this water is supplied by private wells. Therefore, the groundwater aquifer fulfills a critical necessity, fulfilling all needs including human consumption, household uses, and agriculture and

maintenance of livestock and horses in the immediate area around the site. The concern is that if the aquifer becomes contaminated, then the local drinking water will be fouled.

For decades now, policy makers have been using “Aquifer Vulnerability,” to set land use and water resource protection policy. Karst has very high Aquifer Vulnerability. Therefore, this industrial use is not appropriate for this land and it should not be zoned for it. The guiding documents of the WVDEP recognize this. The introduction to the WVDEP document *Stormwater Management Design in Karst Areas* states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.”

The Chesapeake Bay Stormwater Network karst stormwater guidance document the *CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed*, which the WVDEP cites in its own guiding document *Stormwater Management Design in Karst Areas*, clearly agrees stating

“First, the effect of land development on karst terrain is complex and hard to predict, and requires professional analysis to reduce the risk of geological hazards, damage to infrastructure and groundwater contamination.”

“The working group acknowledges that past approaches to stormwater and land development in karst terrain have been inadequate to safeguard the public and the environment.”

“...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.”

We clearly need stronger comprehensive land use plans and zoning that direct new growth away from karst areas to more appropriate locations. Ordinance #2017-302 is literally the opposite of this.

Further, we cannot rely on the WVDEP to do the job that good local land use guidelines and zoning should do. For example, the *CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed* states that detention and retention ponds are not recommended on karst and categorize them as discouraged. Also, quoting WVDEP’s own karst guidance: “attenuating surface runoff will increase the rate of sinkhole formation and potential groundwater contamination.” Yet the entity currently planning to utilize this zoning change is planning employment of multiple massive retention ponds and attenuating surface runoff completely. This has already been approved by the DEP in two Construction Stormwater General Permit registrations for that company. One of detention ponds is not even regulated by the DEP as it contains process water and has no outlet. Clearly the DEP recognizes the risks but is not appropriately limiting them. Relying on the DEP to protect the public health, safety, welfare, and the environment from any entity in these karst locations is simply as the CNS bulletin said it “inadequate to safeguard the public and the environment.” We must have appropriate zoning that takes into consideration appropriate use of land with karst

hydrogeology. Ordinance #2017-302 does not do this, but instead increases the risk to the public and the environment.

A second serious concern is the air emissions from the industry that this zoning will provide for. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. These types of air emissions have been shown to increase the risk of, contribute to, and exacerbate a multitude of developmental, physical, physiological, physiological, cognitive and economic. The exposure of one individual can cause repercussions in multiple generations. Embryos, fetuses, and children are most vulnerable with effects born out over a lifetime, and that of their offspring. Many of these effects only require short-term exposure and some have even been shown to occur at levels below current limits recommended by the World Health Organization. One example of this is that a recent study found that “Even within the limits set by the World Health Organization, the pollutants PM10, SO₂, NO₂, and O₃ are associated with increased risk of treatment for respiratory diseases in children 0 to 6 years of age.” Unfortunately, the US limits are higher than WHO, 300 % higher in the case of PM10!

In fact, in 2019, in the Advice from the Independent Particulate Matter Review Panel (formerly U.S. EPA Clean Air Scientific Advisory Committee Particulate Matter Review Panel) on EPA’s Policy Assessment for the Review of the National Ambient Air Quality Standards for Particulate Matter, it stated that the committee unanimously and unequivocally found that the current primary annual and 24-hour PM_{2.5} National Ambient Air Quality Standards (NAAQS) are not adequate to protect public health. The advice from this 20-member committee, whose scientific disciplines include epidemiology, medicine, toxicology, air quality measurement, air quality modeling, exposure assessment measurement and modeling, risk assessment, statistics, and others, was ignored due presumably to political pressure. Not only are the NAAQS too high in some cases, but due to the measure and mechanism by which they work, they can not replace the safety provided by good land use and zoning regulations, that are meant to do things like keep factories with air emissions and hundreds of heavy trucks away from elementary schools. In fact, there is a state law that prohibits siting a school near a factory. Unfortunately, the reciprocal law does not exist. Clearly, just like with the water resources, we cannot rely on the DEP or the EPA to do the job of what appropriate zoning should do. The whole point of zoning is to keep people safe and provide for their health and welfare. Ordinance #2017-302 puts families and school children directly in harms way.

The air emissions, threat to the groundwater, and the very presence of the industry that this zoning change will allow for will have a serious negative economic effect on those who live and or work closest to the site in question. Productivity and workforce participation will be negatively affected by the health effects of the air emissions. The local agricultural operations will be negatively affected by the air emissions with lower quantity and quality of crop yield and would be devastated if the ground water aquifer were fouled. The equine operations in the area, of which there are several, will be negatively affected by the air emissions as they affect the horses’ health and performance. The mere presence of the industry that will be provided

for by this zoning change will cause property values to fall. There will be serious economic consequences for the immediate area around the site in question.

Several of the communities in the immediate area of the site for proposed zoning change are traditionally underserved and have lower economic status. The choice of this location for such a zoning change represents an egregious example of environmental injustice that should not be promulgated or tolerated.

This zoning change will provide for industry that will negatively affect the health safety and welfare of our community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

jeff kauffman

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The city has failed to address the latter part of this objective. By Changing the SDI in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and child hood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health, and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and overall earnings for owners, breeders, and

trainers. This group provides over 70 million dollars in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. This industry would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitorship and again decreasing return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up this industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the Karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive plan is clear the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Neil Powell

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on #2017-302. The air emissions, possibility of ground and surface water contamination, and their effect on our interwoven economies threaten the health, safety and welfare of not just Jefferson County but the greater region, including Loudoun and the greater Northern Virginia area.

This zoning would provide for industry that produces large amounts of air emissions. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. Northern Virginia is directly downwind from these emissions. Much of the gaseous, fine particulate, and hazardous emissions can reach Northern Virginia. Further affecting the outdoor air quality of the adjacent portion of Virginia and the ability of these areas to achieve and maintain National Ambient Air Quality Standards (NAAQS) attainment. This will affect agriculture and outdoor leisure and recreation.

For example, Loudoun County has been in nonattainment for the NAAQS 8-hour Ozone standard for the past two years. VOC and NO_x react after they have been emitted to produce ground level ozone. The industry that this rezoning would provide for would produce large amounts of these emissions. This would make it even harder as Loudoun County tries to achieve attainment. As time goes on and the scientific research advances our knowledge and understanding of the extent to which gaseous, particulate and hazardous emissions affect human health the NAAQS standards are likely to be reduced. The effects on air emission from this rezoning will make it only harder for Loudoun and Northern Virginia to meet these standards.

In addition to the concerns about the air, the possible ground and surface water contamination is very concerning to Loudoun and Virginia residents. The site is known to have ground water that is vulnerable to contamination due to the karst hydrogeology. A USGS study demonstrated that the ground water adjacent to the site to be rezoned communicates readily with surface

water tributaries of the Potomac River. In addition to direct infiltration where water moves directly from the surface to groundwater via porous limestone bedrock, karst is known to have severe ground instability problems. This makes karst geology prone to sinkhole development. Sinkholes provide direct connection between the surface water and any contaminants it may contain and the groundwater. This makes the aquifer vulnerability in karst areas very high, and contamination with industrial activity such as that provided for by this rezoning too likely.

Loudoun sources its drinking water from the Potomac River, downstream of many West Virginia tributaries that carry water from the epikarst and groundwater aquifer at the site to be rezoned. Loudoun has recently completed the new Trap Rock Water Treatment facility, which draws water from the Potomac River. Loudoun currently provides 40 million gallons and projects to provide 90 million gallons of drinking water a day to customers by 2040 (Loudounwater.org). Therefore, the viability of the Potomac River is a high priority for Virginia residents.

Loudoun and Northern Virginia is one of the fastest growing communities in the country and provides a lot to Jefferson County in their symbiotic relationship. Virginia residents support and enjoy Jefferson County through tourism, as our residents enjoy the natural and historical resources of your county. Virginia residents and businesses support the equine industry in a multitude of ways from providing wagering fans at the races to the Virginia Breeders Association Virginia Certified incentive programs and a strong market for retired racehorses. According to an economic impact study from WVU, at least 40% of Jefferson County residents travel outside of West Virginia for work, a good percentage of those travel to northern Virginia. This rezoning would allow for industry that would negatively affect the economy of both places and this relationship and the benefits for our residents gleaned from it.

This zoning change will provide for industry that will negatively effect the health safety and welfare of the Loudon and Northern Virginia community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Nicole Gill

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. ... ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

Never has the panhandle been more united against an industrial incursion from outsiders. 90+% of residents of Ranson and neighboring communities are against Rockwool. How can our legislators support these changes unless they (you) are corrupt and getting favors or kickbacks?

Please vote no on the ordinance #2017-302.

Sincerely,

Andrew Wandler
Harpers Ferry, 25425

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,
Kristen Pak

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would have a negative effect on water and air quality in neighboring states such as Maryland.

The Potomac River provides drinking water and a source of recreation to Maryland residents. Water and air pollution generated within the Potomac River's watershed will inevitably contaminate this valuable waterway. The site of the proposed zoning change in Ranson is located within the Potomac River Watershed.

The type of industry that ordinance #2017-30 would allow in Ranson would utilize large water impoundments, in an area of known karst terrain. This water will be contaminant from several sources including particulate mater that has fallen out from the air emissions and process water. The West Virginia Department of Environmental Protection has published guidelines that specifically discourage extensive development in areas of karst terrain because of the vulnerability of karst aquifers to contamination by surface pollution. Karst features increase surface water and groundwater connectivity and any spills or surface releases quickly percolate into the groundwater. Additionally, sinkholes are common in karst terrain and can cause ruptures in wastewater impoundments. Even if appropriate attempts are made to contain and manage wastewater and other stormwater runoff on-site, there is still a high risk that wastewater could contaminate the groundwater through tears and catastrophic failure of wastewater impoundments. Contaminated groundwater in karst terrain can easily resurface in waterways several miles away, as shown by a USGS tracer study conducted near the site in to be rezoned. The USGS study detected tracer dye in multiple springs and waterways miles from the initial injection site in Ranson. All of these waterways drain into the Potomac River.

Mismanagement of wastewater could also lead to contamination of nearby surface waters. For example, the site of the proposed rezoning in Ranson is in the Rocky Marsh Run watershed.

Rocky Marsh Run also drains to the Potomac River. Voting no on ordinance #2017-302 will preserve downstream water quality and help ensure that the Potomac River remains usable for Maryland residents.

Air pollution poses another risk to Maryland residents. The type of industry that ordinance #2017-302 would allow would generate air pollutants like fine particulate matter. According to the US EPA, fine particulates can travel 100s of miles from its original source. Air pollution related to industrial activity in Ranson could easily reach Maryland. Fine particulates have a greater affinity for carrying toxic compounds and their small size allows them to be inhaled more deeply into the lungs. Chronic exposure to fine particulate matter is associated with increased risk of several diseases including Alzheimer's in adults. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease among others. Fine particulate matter also exacerbates regional haze which creates a visible reminder of air pollution. The psychological effects that arise from an increased perception of pollution include stress, anxiety, and unhappiness. Voting no on ordinance #2017-302 will help prevent increased air pollution from negatively affecting the long-term health of Maryland residents.

I again request that you vote no on ordinance #2017-302. Zoning decisions in Ranson and Jefferson County have an undeniable influence on the quality of life in neighboring states. We are all in this together- what affects one thing affects all things. Please vote no on this ordinance. Thank you for your consideration.

Sincerely,
Kelly White

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask you to vote NO on Ordinance #2017-302. The industry this zoning change will allow for endangers the health, safety and, welfare of the community, and violates the premise of the smart code zoning that we have spent so much time, effort and federal money employing.

Any change in zoning needs to align with the comprehensive plan. In Ranson's current comprehensive plan (2012), the City only refers to "heavy industry" in the history section. Here it is characterized as part of a bygone era that has been replaced by an emphasis on agriculture for local food production, open spaces, and quality-of-life. In the remainder of the document, the word industry is used loosely to describe businesses including flower shops and shoe stores. Nothing that resembles the industry that this zoning change will provide for is described in the current comprehensive plan of Ranson.

In the land use section of the comprehensive plan, number ten states:

"Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The comprehensive plan clearly states that the city will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community. This change in zoning clearly negatively affects the health, safety, and welfare of the community.

As the zoning is proposed, the industry that this zoning change will allow for will be directly across the street from houses, parks and other small businesses. A densely populated subdivision and an elementary school already exit directly across the street. While these latter

community sections are not in the city limits, the effect of this zoning on them should still be considered just the same as it would be if they were in the city limits.

The industry that this zoning change will provide for will produce particulate, gaseous, and hazardous air emissions. These emissions have been shown to be detrimental to human health at every stage of life from embryo to old age. In utero and childhood exposure are the most damaging with lasting effects being realized through out life, and with maternal exposure the effects can be felt for generations. Multiple organ systems are affected including respiratory, cardiovascular, neurologic, immune, and endocrine causing defects in multiple processes including in utero development, neurodevelopment, immune and tolerance development, and cognitive defects. There are also psychological, social, and economic effects from both perceived and actual air pollution in both children and adults. Many of these effects can be seen even with short-term exposure or exposure that is lower than the levels recommended by the US Environmental Protection Agency and World Health Organization. These consequences are devastating to the individual and depressing to the local community and economy. State law does not allow a school to be built next to industry that this zoning will allow but yet we are contemplating changing the zoning so this industry can build next to a school. This does not make sense. As Ranson residents, we want Ranson to follow the lead of the state and keep polluting industry away from kids. In these ways, this change in zoning will negatively affect the health and welfare of the community.

In addition to the health effects of the air emissions is the threat to groundwater from the industry that this zoning change would allow. The land in question has karst hydrogeology and therefore very high aquifer vulnerability and is not appropriate for this industry. With the type of industry this zoning will provide for, combined with high aquifer vulnerability, the likelihood of groundwater contamination is too high for the community and region to bear. A USGS study demonstrated that contamination in the groundwater adjacent to the site moves relatively quickly and can be found in wells and surface water structures in a variety of locations in the County. In this way, contamination at the site would affect the drinking water of the great majority of Jefferson County residents. Through the surface water connections, the water at the site also affects the water resources of the region.

Aquifer vulnerability has been used by policy makers for decades to set land use regulations. The guiding document, from the WVDEP, *Stormwater Management Design in Karst Areas* states, "it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." In Ranson, we need to follow this advice and not change the zoning of this land for use by industry that has among the highest aquifer vulnerability in the County. This zoning change will endanger the safety of the community and region by endangering the safe water resources. As Ranson residents, we want to safeguard the water resources of the county and region by following the WVDEP guidance here.

Further, by reallocating this transect district and replacing it with a monolithic block of Special District Industrial designation, hundreds of housing units, parks and space for small businesses are lost. Ranson loses the potential for property tax on these properties and their improvements, Business and Occupational tax on the businesses and sales tax in retail stores. The community loses out on the opportunity to develop affordable housing and create locations where people can live, work, play, and shop all in the same place reducing the need for travel.

Worse yet apparently a deal has been made where the entity that owns the subject land has required that a litany of things not be built on the adjacent land essentially stripping the purpose of the smart code transect zone that exists there. Transect zones in the smart code are meant to transition, from out to in, and provide communities where people can safely work and live in close proximity in an effort to reduce travel. Excluding many of the components of the transect zone effectively eliminates the features that make it a transect zone, thus, losing the benefits a transect zone offers the community and city. By losing these benefits, reducing the overall and affordable housing prospects, and reducing so drastically the opportunities for city income, this zoning change will negatively affect the welfare of the community.

As Ranson residents, we find it odd that we are changing zoning to provide for industry that we would not put in the middle of our town close to our residents, but we are placing it close to the homes of county residents. Further, it is striking that the area where this change in zoning is directly adjacent to historically underserved lower income communities and a Title I school. This amounts to environmental injustice and cannot be tolerated.

The purpose of zoning is for a city to protect the health, welfare, morals and safety of the community. In this case, the air emissions and heavy truck traffic will endanger the communities' health. The threat of water contamination will endanger the safety of the community. The effect of lost productivity and decreased workforce participation due to increased illness and the negative effect the air emissions and presence of such a factory will have on the local economy will negatively affect the welfare of the community. The environmental injustice of changing the zoning to accommodate such polluting industry in a location where your municipality has no residents, but yet hundreds of low income and underserved county residents live is egregiously amoral. This must not happen. We respectfully implore you to do the right thing and vote no on ordinance #2017-302.

Sincerely,

Vladislav Shevtsov

The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community. Additionally I grew up around Nitro WV and would hate to to have our beautiful area turned into an industrial chemical belcher!

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Tiffany Miller

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The city has failed to address the latter part of this objective. By Changing the SDI in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and child hood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health, and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and overall earnings for owners, breeders, and

trainers. This group provides over 70 million dollars in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. This industry would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitorship and again decreasing return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up this industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the Karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive plan is clear the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Karen Dyke

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

I have lived in Ranson for over 42 years and the industrialization of our county is clearly unwanted and not necessary as it would be disastrous our county and surrounding areas for many years to come.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Ruth Hatcher

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that will significantly harm the municipalities within Jefferson County and beyond effecting the health, welfare, and safety of our community. Harpers Ferry is a national treasure with the natural and historic resources tours flock to see each year and one of the communities that will be negatively impacted by this zoning change.

According to a 2019 study by the West Virginia Tourism Office, Jefferson County generated an average of \$178 million per year in tourism-derived revenue for state and local governments over the last 10 years, more than any other county in West Virginia by at least double. Tourism benefits the businesses and economy of Ranson and Jefferson County producing \$213.7 million in individual earning, 7040 jobs, and \$842.6 million in direct spending here in 2018. We would need 40 Project Shuttles to replace the individual earnings and 59 Rockwools to replace the jobs provided by the tourism industry in Jefferson County. It is important to note that most of the money generated by tourism in Jefferson County comes from neighboring states. In this way, it is like an export: not simply recycling money, but bringing money into the state increasing its wealth. Much of the economy in Harpers Ferry is based on this tourism industry. A threat to this industry poses a threat to the economy and welfare of our community.

One of the important drivers for tourism in Harpers Ferry is the Appalachian Trail. According to the Appalachian Trail Conservancy (ATC), Harpers Ferry is the psychologic midpoint of the Trail, and hikers often plan extended stays in Jefferson County with an obvious positive impact. The ATC reports that the smokestacks and associated lights will be visible in the viewshed of 15 vistas on the Appalachian Trail (AT). Studies have shown that quality of vistas and human impact on the environment are not only noticed by visitors, but effect their experience. Another study published in the Journal of Applied Recreation Research, found that points of interests and views drew visitors' attention and had a significant impact on their perception of the trail. It was also found that particularly beautiful vistas helped visitors overlook elements

that usually have a negative effect on trail experience like increased trail traffic. A 2009 study in Leisure Sciences revealed that scenic value was a perceptual theme of Appalachian Trail visitors, and that things as simple as dead trees visible in a vista can have a negative impact on visitors' overall perception. Imagine the effect the smokestacks will have from the 15 vistas from which they will be visible. The introduction of industrial activity made possible by the proposed rezoning in Ranson would have a negative effect on the scenic views of beautiful landscapes from the Appalachian Trail in Jefferson County.

The smokestacks are not all visitors will be able to see — the air pollution will create haze. The effect of regional haze on tourists was explored in a review article published in the Atmospheric Environment titled "Impaired visibility: the air pollution people see." A key takeaway on the negative affect of haze on vacationing tourists was summarized as follows:

"Vacations offer an escape from the routine and stress of our daily lives. Vacation destinations are often chosen based on their scenery; vacations are spent gazing at monuments, mountains, clouds, and oceans. Good visibility allows clear observation of distant features and appreciation of the inherent beauty of these scenes...Air pollution, which is often present in both our cities and parks, interferes with these attributes and can ruin the views vacationers travel to enjoy."

People seek bucolic, unspoiled areas to escape the stresses of urban areas. A 2004 study in Environment and Behavior found perceived pollution causes stress while viewing natural scenes has both psychological and physiological benefits, and a 2007 study confirmed these benefits. Two other studies found that people are emotionally affected by poor visibility, and tourists are disappointed when views are obscured by haze.

The combination of smokestacks and haze will mar the viewshed and will not only reduce the positive effects of a scenic landscape but also leave tourists disappointed and dissatisfied with their choice of destination. With these effects the welfare of the Harpers Ferry community would undoubtedly be endangered by the industry that this zoning change will provide for.

Multiple studies by doctors Kozar, Doctor, and Doctor have demonstrated that the land at this site to be rezoned is Karst with the highest likelihood of sinkhole development in the county, and that the groundwater aquifer there is incredibly sensitive to contamination from surface water. Further, this site is on an upland plain with relatively few surface streams, seasonal variability in the water table that results in numerous estavelles, and large amounts of water in the epikarst. In this area contamination in surface water communicates easily to the water in the epikarst via diffuse and point infiltration, and the springs at the margins of the upland area are directly affected by the water quality throughout the aquifer. According to Jefferson Orchards Voluntary Remediation Plan with the WVDEP, the groundwater at the site is approximately 60 feet below the ground, and the tests performed by the USGS have shown that groundwater from just adjacent to this site emerged in the headwaters of both the Elk's Run and Rattlesnake Run. This is critically important for Harpers Ferry because the Elk's Run headwaters is a spring about three miles southeast of the site and goes on to become the drinking water source for Harpers Ferry and Bolivar before emptying into the Potomac River.

The headwaters of Rattlesnake Run is a spring about 3.5 miles from the site and is also a tributary of the Potomac River. The Potomac River is the back up water source for Harpers Ferry. This means that the activity at the site will have a critical influence on the drinking water of Harpers Ferry. In this was the industry permitted by this change in zoning would undoubtedly endanger the health and safety of the community in Harpers Ferry.

The untoward health effects and individual economic consequences from the pollution emissions of the industry this rezoning will allow that will be born out over the length of people's lives and that of their decedents for at least three generations is an egregious example of environmental injustice that should not be tolerated. This zoning change may be in one of the poorest sections of the county, but the effects will be felt in every part of Ranson and the county.

The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." The industry that this rezoning will allow will jeopardize the health, safety and welfare of Ranson, Harpers Ferry and the whole county. Please vote no on the ordinance #2017-302.

Sincerely,

Christopher Leipold

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would put at risk the health and well being of children of Jefferson County.

The type of industry that ordinance #2017-302 would allow in Ranson would generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. Exposure to these pollutants has devastating effects on children's health. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. Developing fetuses whose mothers are exposed to air pollution are more likely to have impaired organ development which can lead to early cognitive deficits, neurodevelopmental defects and other physical, cognitive, and psychological deficits later in life. An association between autism and prenatal exposure to particulate matter in air pollution has been demonstrated in several studies. Many studies have shown that lower test scores in math, English, and language arts are associated with exposure to outdoor air pollution. Industrial activity allowed by ordinance #2017-302 would also increase the risk of groundwater contamination in Ranson and nearby municipalities. Children whose families rely on well water, as is the case in much of Jefferson County, may be affected by polluted water. Voting no on ordinance #2017-302 will prevent air and water pollution from negatively affecting the long-term health of children in Jefferson County and surrounding areas.

The economic and environmental harm caused by the type of industry that ordinance #2017-302 would allow would put additional stress on the parents, caretakers, and teachers of children in affected areas. The weakening and destabilizing of this support network would have negative effects on local children. Many households in Jefferson County depend on the local agriculture, tourism, and equine industries for income. If industrial activity in Ranson depresses these industries, the resulting financial strain on these households will introduce additional stress and uncertainty into children's lives. Households living in areas affected by particulate

matter and regional haze will also suffer from the psychological effects of air pollution. Individuals living in areas with increase perception of pollution show increased levels of stress, anxiety, and unhappiness. School districts affected by increased air and water pollution may have trouble recruiting and retaining teachers. Teachers have a large influence on a child's daily life and, if educator quality and tenure decreases, the quality of this influence will diminish.

The site of the proposed rezoning in Ranson is across the road from an elementary school and proximal to lower-income neighborhoods. Observations like these demonstrate how ordinance #2017-302 would disproportionately affect vulnerable and historically-disadvantaged populations. The damaging health effects of air pollution have been shown to persist for at least three generations, so allowing certain types of industry in low-income areas would only compound existing disadvantages. Voting no on ordinance #2017-302 would be a step towards acknowledging that all individuals have the right to clean air and water.

Children face increased exposure to air pollution, groundwater contamination, financial instability, and environmental discrimination if ordinance #2017-302 is passed. Please vote no on ordinance #2017-302.

Sincerely,

Christopher Burns

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

To the City of Ranson and all concerned parties,

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the

health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Although this is a prewritten statement, I have read and fully understand and agree with the contents therein.

Signed,

Tim Wiltshire

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask that you vote no on Ordinance #2017-302. While not in Ranson, the land and homes around the property that is the subject of the zoning change are closer to the property than anyone who currently lives within the city limits of Ranson. This area will be affected sooner and more harshly by the environmental issues that will develop secondary to the inappropriate siting of industry this zoning would allow.

The subject land has been well studied by Drs. Kozar, Doctor and Doctor and described in the scientific literature and USGS reports as having karst hydrology with very high aquifer vulnerability. The karst landscape is a consequence of the presence of soluble bedrock, which consists of limestone in the case of the subject land. In such landscapes water percolates through the ground and dissolves the underlying rock creating a porous network of caverns and throughways. Karst aquifers are known to be "extremely vulnerable to pollution" due to direct connection between the surface water and groundwater through both point (sinkholes) and diffuse (everywhere) infiltration. It is known from the Voluntary Remediation Plan of Jefferson Orchard that the groundwater at the subject site is only 60 feet below the ground. The subject property and much of the property around it are on an upland plain with few surface streams, but great seasonal variability in the water table resulting in numerous esteves and large amounts of water in the epikarst. This water is easily contaminated and this contamination spreads quickly throughout the aquifer. Dye tests performed near the subject site by the USGS have demonstrated this quick moving thorough dispersment in the aquifer in this area. While this contamination goes on to affect springs at the margins of the upland area continuing on in streams that service municipal water sources and the Potomac River, our concerns are far more immediate in both time and distance. Well water is the only water source available in the area of the proposed zoning change and, with the exception of Fox Glen, a majority of this water is supplied by private wells. Therefore, the groundwater aquifer fulfills a critical necessity, fulfilling all needs including human consumption, household uses, and agriculture and

maintenance of livestock and horses in the immediate area around the site. The concern is that if the aquifer becomes contaminated, then the local drinking water will be fouled.

For decades now, policy makers have been using “Aquifer Vulnerability,” to set land use and water resource protection policy. Karst has very high Aquifer Vulnerability. Therefore, this industrial use is not appropriate for this land and it should not be zoned for it. The guiding documents of the WVDEP recognize this. The introduction to the WVDEP document *Stormwater Management Design in Karst Areas* states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.”

The Chesapeake Bay Stormwater Network karst stormwater guidance document the *CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed*, which the WVDEP cites in its own guiding document *Stormwater Management Design in Karst Areas*, clearly agrees stating

“First, the effect of land development on karst terrain is complex and hard to predict, and requires professional analysis to reduce the risk of geological hazards, damage to infrastructure and groundwater contamination.”

“The working group acknowledges that past approaches to stormwater and land development in karst terrain have been inadequate to safeguard the public and the environment.”

“...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.”

We clearly need stronger comprehensive land use plans and zoning that direct new growth away from karst areas to more appropriate locations. Ordinance #2017-302 is literally the opposite of this.

Further, we cannot rely on the WVDEP to do the job that good local land use guidelines and zoning should do. For example, the *CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed* states that detention and retention ponds are not recommended on karst and categorize them as discouraged. Also, quoting WVDEP’s own karst guidance: “attenuating surface runoff will increase the rate of sinkhole formation and potential groundwater contamination.” Yet the entity currently planning to utilize this zoning change is planning employment of multiple massive retention ponds and attenuating surface runoff completely. This has already been approved by the DEP in two Construction Stormwater General Permit registrations for that company. One of detention ponds is not even regulated by the DEP as it contains process water and has no outlet. Clearly the DEP recognizes the risks but is not appropriately limiting them. Relying on the DEP to protect the public health, safety, welfare, and the environment from any entity in these karst locations is simply as the CNS bulletin said it “inadequate to safeguard the public and the environment.” We must have appropriate zoning that takes into consideration appropriate use of land with karst

hydrogeology. Ordinance #2017-302 does not do this, but instead increases the risk to the public and the environment.

A second serious concern is the air emissions from the industry that this zoning will provide for. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. These types of air emissions have been shown to increase the risk of, contribute to, and exacerbate a multitude of developmental, physical, physiological, physiological, cognitive and economic. The exposure of one individual can cause repercussions in multiple generations. Embryos, fetuses, and children are most vulnerable with effects born out over a lifetime, and that of their offspring. Many of these effects only require short-term exposure and some have even been shown to occur at levels below current limits recommended by the World Health Organization. One example of this is that a recent study found that “Even within the limits set by the World Health Organization, the pollutants PM10, SO₂, NO₂, and O₃ are associated with increased risk of treatment for respiratory diseases in children 0 to 6 years of age.” Unfortunately, the US limits are higher than WHO, 300 % higher in the case of PM10!

In fact, in 2019, in the Advice from the Independent Particulate Matter Review Panel (formerly U.S. EPA Clean Air Scientific Advisory Committee Particulate Matter Review Panel) on EPA’s Policy Assessment for the Review of the National Ambient Air Quality Standards for Particulate Matter, it stated that the committee unanimously and unequivocally found that the current primary annual and 24-hour PM_{2.5} National Ambient Air Quality Standards (NAAQS) are not adequate to protect public health. The advice from this 20-member committee, whose scientific disciplines include epidemiology, medicine, toxicology, air quality measurement, air quality modeling, exposure assessment measurement and modeling, risk assessment, statistics, and others, was ignored due presumably to political pressure. Not only are the NAAQS too high in some cases, but due to the measure and mechanism by which they work, they can not replace the safety provided by good land use and zoning regulations, that are meant to do things like keep factories with air emissions and hundreds of heavy trucks away from elementary schools. In fact, there is a state law that prohibits siting a school near a factory. Unfortunately, the reciprocal law does not exist. Clearly, just like with the water resources, we cannot rely on the DEP or the EPA to do the job of what appropriate zoning should do. The whole point of zoning is to keep people safe and provide for their health and welfare. Ordinance #2017-302 puts families and school children directly in harms way.

The air emissions, threat to the groundwater, and the very presence of the industry that this zoning change will allow for will have a serious negative economic effect on those who live and or work closest to the site in question. Productivity and workforce participation will be negatively affected by the health effects of the air emissions. The local agricultural operations will be negatively affected by the air emissions with lower quantity and quality of crop yield and would be devastated if the ground water aquifer were fouled. The equine operations in the area, of which there are several, will be negatively affected by the air emissions as they affect the horses’ health and performance. The mere presence of the industry that will be provided

for by this zoning change will cause property values to fall. There will be serious economic consequences for the immediate area around the site in question.

Several of the communities in the immediate area of the site for proposed zoning change are traditionally underserved and have lower economic status. The choice of this location for such a zoning change represents an egregious example of environmental injustice that should not be promulgated or tolerated.

This zoning change will provide for industry that will negatively affect the health safety and welfare of our community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Pamela Hutchison

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The city has failed to address the latter part of this objective. By Changing the SDI in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and child hood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health, and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and overall earnings for owners, breeders, and

trainers. This group provides over 70 million dollars in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. This industry would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitorship and again decreasing return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up this industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the Karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive plan is clear the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Anthony Smith

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on Ordinance #2017-302. Ranson's proposed zoning change presents a significant risk to the equine industry in Jefferson County and well beyond. The type of industry that would be allowed by the proposed zoning change in this location would jeopardize horse health, the groundwater supply, and workforce productivity. This will cause immediate shrinkage and threaten the long-term viability of the equine industry in the county.

The site of the proposed rezoning is less than six miles from Charles Town Races, with several breeding, training, and rehabilitation facilities between the two. The industry allowed by this rezoning would produce particulate, gaseous, and hazardous air emissions that would reach these sites. According to the WVDEP air permit, the Rockwool plant in Ranson is permitted to emit 250.87 tons of particulate matter per year into the air (1).

According to a recent study published in the journal of Veterinary Internal Medicine (2), horses are 15 times more sensitive to inhaled particulate matter than humans. Inhaled particulate matter can cause inflammation in horses' lungs that negatively affects performance. Inhaled particulate matter also contributes to the development of inflammatory airway disease (IAD) (3). IAD is a chronic airway disease that can affect horses long after their racing career is over. While there is little research on how other air pollutants affect horses, the effects of pollution on humans can be used to infer potential impact on horses. However unlike human models, these horses are elite athletes continuously exposed, and will thus likely experience detrimental effects at much lower levels of air pollution than humans.

The primary concern with air pollution is that increased levels of pollutants will increase inflammation in horses' lungs. Even small, subclinical amounts of inflammation in the lungs of horses negatively affect performance (2,3,4,5,6,11). This inflammation can also cause increased recovery times following racing (7,11). Reduced performance and training interruptions can lead to higher risk of injury, reduced winning average, fewer yearly starts, lower yearly

earnings, shortened career length, fewer lifetime starts, reduced lifetime earnings, and reduced quality of life (2,3,8,9,11). Each of these situations will lead to decreased return on investment, decreased cash flow, and decreased overall earnings for owners, trainers, and breeders with horses at Charles Town Races and in nearby areas.

While racing is usually a thoroughbred's first career, it is rarely their last. Some racing horses go on to be breeding stock, while others will have successful careers as sport horses. Jefferson County is an important source of new stock for sport horse trainers from Northern Virginia, and Maryland, and this is a resource for local horseman of both income and placement for horses not appropriate for breeding. However, if retired racehorses are unsound from injury or respiratory disease, they can be difficult to manage as breeding stock or unfit for a career as a sport horse. This affects the horse's quality of life and also places a burden on the industry locally and regionally.

The perception of decreased air quality from the increase in regional haze and visible smokestacks as one drives into the county will deter out of state owners and breeders from investing in West Virginia bred Race horses, decreasing or eliminating a critical \$50 million a year source of local business volume.

Another concern related to the proposed rezoning in Ranson is the risk of groundwater contamination as a result of the karst hydrogeology at the site and the industrial activity. Horsemen will either have to take on the expense of periodically testing water sources or they may not know local ground water is contaminated until their animals are sick. Veterinary care and testing adds expense and uncertainty to an industry that already deals with large inherent risks. The actual occurrence of ground water contamination would be devastating for Jefferson County's equine industry. For both geographic and financial reasons, it is simply impossible to think that the industry could solely use public or private utility-provided water if industrial activity fouled the local groundwater.

Finally, studies on US agricultural workers have demonstrated that increased air pollution decreases productivity of outdoors workers. This would place an additional burden on workers, small business owners and the industry.

The equine industry in Jefferson County is hundreds of years old. It is not worth risking this historic and economically valuable industry by rezoning for industrial companies like Rockwool. An economic impact study of the Charles Town Thoroughbred Horse Racing Industry on Jefferson County's economy found that the spending by owners, breeders, and trainers of the equine industry directly contributes \$79.4 million to the county each year. Out-of-state owners, breeders, and trainers spend more than \$50 million in Jefferson County every year. The value of total business volume in Jefferson County is \$191 million each year (10). These numbers do not include the effect of the handle or the casino.

The equine industry provides jobs for a broad cross-section of the public. This industry offers individuals of any educational background a variety of paths to achieve a good middle-income

living. Many jobs allow individuals to pursue apprenticeships or on-the-job training rather than requiring a costly college education. This flexibility allows for greater lifetime earnings and improved educational debt-to-earnings ratio for these workers. The equine industry also provides opportunities for non-traditional workers by offering job opportunities to those who may not be employable by larger corporations. This industry provides a variety of full-time, part-time, flexible, and pick-up work. Encouraging this type of flexible job ecosystem helps create a healthy economy with broad participation in employment and consumption.

The equine industry is a large conglomerate of small businesses, which have a multitude of economic benefits over having a few large businesses. It has been extensively reported that small locally owned businesses and start ups create more jobs, cultivate innovation, generate higher incomes, and provide more opportunities for individuals that would otherwise not exist than big non-local firms, which can actually depress local economies. The equine industry provides opportunities for small businesses and startups responsible for this growth of better jobs that are so good for the economy.

The equine industry offers so many other benefits that the industry in the rezoned area would not. For example, the equine industry supports local agriculture by providing a market for agricultural goods such as straw. The robust straw market supported by owners, trainers, and breeders allows for a third cash crop to be produced from one field in a year. Through pastureland and support of local agricultural goods, the equine industry protects and preserves the open spaces that give our county its bucolic quality and help attract tourists. Through the breeders' incentive programs, the equine industry offers unique opportunities to draft state funds back to Jefferson County, to name a few.

Rezoning this area of Ranson for Special District Industrial will allow in entities whose activities are harmful to the equine industry. The losses incurred by the equine industry would far outweigh any benefits derived from industries occupying the rezoned area. Sacrificing the long-term viability of one of our oldest and most productive industries for a net loss in business volume and economic value just does not make good sense for the local economy. Please vote NO on Ordinance #2017-302.

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The city has failed to address the latter part of this objective. By Changing the SDI in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and child hood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health, and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and overall earnings for owners, breeders, and

trainers. This group provides over 70 million dollars in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. This industry would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitorship and again decreasing return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up this industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the Karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive plan is clear the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Dave Chicchirichi Jr

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would have a negative effect on water and air quality in neighboring states such as Maryland.

The Potomac River provides drinking water and a source of recreation to Maryland residents. Water and air pollution generated within the Potomac River's watershed will inevitably contaminate this valuable waterway. The site of the proposed zoning change in Ranson is located within the Potomac River Watershed.

The type of industry that ordinance #2017-30 would allow in Ranson would generate large quantities of wastewater, stored on-site, in an area of known karst terrain. The West Virginia Department of Environmental Protection has published guidelines that specifically discourage extensive development in areas of karst terrain because of the vulnerability of karst aquifers to contamination by surface pollution. Karst features increase surface water and groundwater connectivity and any spills or surface releases quickly percolate into the groundwater. Additionally, sinkholes are common in karst terrain and can cause ruptures in wastewater impoundments. Even if appropriate attempts are made to contain and manage wastewater and other stormwater runoff on-site, there is still a high risk that wastewater could contaminate the groundwater through tears and catastrophic failure of wastewater impoundments. Contaminated groundwater in karst terrain can easily resurface in waterways several miles away, as shown by a USGS tracer study conducted near the site in Ranson. The USGS study detected tracer dye in multiple springs and waterways miles from the initial injection site in Ranson. All of these waterways drain into the Potomac River.

Mismanagement of wastewater could also lead to contamination of nearby surface waters. For example, the site of the proposed rezoning in Ranson is in the Rocky Marsh Run watershed. Rocky Marsh Run also drains to the Potomac River. Voting no on ordinance #2017-30 will

preserve downstream water quality and ensure that the Potomac River remains usable for Maryland residents.

Air pollution poses another risk to Maryland residents. The type of industry that ordinance #2017-302 would allow would generate air pollutants like fine particulate matter. According to the US EPA, fine particulates can travel 100s of miles from its original source. Air pollution related to industrial activity in Ranson could easily reach Maryland. Fine particulates have a greater affinity for carrying toxic compounds and their small size allows them to be inhaled more deeply into the lungs. Chronic exposure to fine particulate matter is associated with increased risk of Alzheimer's in adults. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. Fine particulate matter also exacerbates regional haze which creates a visible reminder of air pollution. The psychological effects that arise from an increased perception of pollution include stress, anxiety, and unhappiness. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of Maryland residents.

I again request that you vote no on ordinance #2017-302. Zoning decisions in Ranson and Jefferson County have an undeniable influence on the quality of life in neighboring states.

Sincerely,

Craig O'Hara

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on #2017-302. The air emissions, possibility of ground and surface water contamination, and their effect on our interwoven economies threaten the health, safety and welfare of not just Jefferson County but the greater region, including Loudoun and the greater Northern Virginia area.

This zoning would provide for industry that produces large amounts of air emissions. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. Northern Virginia is directly downwind from these emissions. Much of the gaseous, fine particulate, and hazardous emissions can reach Northern Virginia. Further affecting the outdoor air quality of the adjacent portion of Virginia and the ability of these areas to achieve and maintain National Ambient Air Quality Standards (NAAQS) attainment. This will affect agriculture and outdoor leisure and recreation.

For example, Loudoun County has been in nonattainment for the NAAQS 8-hour Ozone standard for the past two years. VOC and NO_x react after they have been emitted to produce ground level ozone. The industry that this rezoning would provide for would produce large amounts of these emissions. This would make it even harder as Loudoun County tries to achieve attainment. As time goes on and the scientific research advances our knowledge and understanding of the extent to which gaseous, particulate and hazardous emissions affect human health the NAAQS standards are likely to be reduced. The effects on air emission from this rezoning will make it only harder for Loudoun and Northern Virginia to meet these standards.

In addition to the concerns about the air, the possible ground and surface water contamination is very concerning to Loudoun and Virginia residents. The site is known to have ground water that is vulnerable to contamination due to the karst hydrogeology. A USGS study demonstrated that the ground water adjacent to the site to be rezoned communicates readily with surface

water tributaries of the Potomac River. In addition to direct infiltration where water moves directly from the surface to groundwater via porous limestone bedrock, karst is known to have severe ground instability problems. This makes karst geology prone to sinkhole development. Sinkholes provide direct connection between the surface water and any contaminants it may contain and the groundwater. This makes the aquifer vulnerability in karst areas very high, and contamination with industrial activity such as that provided for by this rezoning too likely.

Loudoun sources its drinking water from the Potomac River, downstream of many West Virginia tributaries that carry water from the epikarst and groundwater aquifer at the site to be rezoned. Loudoun has recently completed the new Trap Rock Water Treatment facility, which draws water from the Potomac River. Loudoun currently provides 40 million gallons and projects to provide 90 million gallons of drinking water a day to customers by 2040 (Loudounwater.org). Therefore, the viability of the Potomac River is a high priority for Virginia residents.

Loudoun and Northern Virginia is one of the fastest growing communities in the country and provides a lot to Jefferson County in their symbiotic relationship. Virginia residents support and enjoy Jefferson County through tourism, as our residents enjoy the natural and historical resources of your county. Virginia residents and businesses support the equine industry in a multitude of ways from providing wagering fans at the races to the Virginia Breeders Association Virginia Certified incentive programs and a strong market for retired racehorses. According to an economic impact study from WVU, at least 40% of Jefferson County residents travel outside of West Virginia for work, a good percentage of those travel to northern Virginia. This rezoning would allow for industry that would negatively affect the economy of both places and this relationship and the benefits for our residents gleaned from it.

This zoning change will provide for industry that will negatively effect the health safety and welfare of the Loudon and Northern Virginia community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Ed Wotring

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The city has failed to address the latter part of this objective. By Changing the SDI in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and child hood as development is exquisitely sensitive during these times, but the effects are realized through out life negatively impacting a variety of lifetime parameters including physical and mental health, and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over 70 million dollars in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and over all earnings. This industry would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitorship and again decreasing return on investment, cash flow, and over all earnings for the hundreds of small businesses that make up this industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the Karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive plan is clear the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Melissa Potter

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would negatively affect tourism, economic agility, groundwater quality, and individual health in neighboring municipalities like Shepherdstown.

Tourism is critically important to Shepherdstown's economy and to the county as a whole. In 2018, tourist spending in the Jefferson County contributed over \$170 million to state and local government revenue and \$213 million in individual earnings. Importantly, most of this money comes from tourists visiting from neighboring states like Virginia, Maryland, and Washington D.C. Out-of-state tourists are largely drawn to Jefferson County because of its reputation for environmental-friendly, sustainable industry. Key elements that support this reputation include the county's pastoral scenery and pristine natural resources. Ordinance #2017-302 will allow industry into Jefferson County that risks harming these elements and dramatically reducing the area's appeal to visitors. The resulting harm to our tourist industry would drive away visitors and decrease state, county, and local revenue. The long-term success of Jefferson County's tourism industry is dependent on local governments making coordinated zoning decisions. Allowing certain types in industry in Ranson will negatively affect tourism in every municipality throughout the county, including Shepherdstown. Voting no on ordinance #2017-302 will protect the foundations of the county's tourism industry and protect the 7,040 jobs in Jefferson County that are directly supported by tourism.

The type of large, consolidated industry that ordinance #2017-302 would allow in Ranson would generally reduce the flexibility of local economies in Jefferson County. Historically, the driving industries in Jefferson County have been tourism, agriculture, and the equine industries. These three industries are large conglomerates of small businesses. Small business is very important to Sheherdstown. Small businesses have been shown to create more jobs, cultivate more innovation, and provide more opportunities than big, non-local firms. Additionally, small businesses have been shown to more reactive to sudden changes relative to manufacturing

businesses. Bringing large, manufacturing-based industry into Jefferson county will depress the local economy and stifle innovation. During this time of economic upheaval and uncertainty, Jefferson County needs to support industries that will allow local economies to adapt and recover as fast as possible.

Voting no on ordinance #2017-302 will help protect water resources throughout Jefferson County. The type of industry that ordinance #2017-302 would allow puts the ground resources of Jefferson county at significant risk due to the karst hydrogeology. The site in Ranson is in the Rocky Marsh Run watershed, which is in the source water protection zone for Shepherdstown and drains to the Potomac River. Therefore, activity at this site will affect both groundwater and surface water streams. In municipalities like Shepherdstown, many residents and nearby farms depend on wells for water. Contamination of groundwater aquifers would create both health and remediation concerns for local residents. Dye tests performed by the USGS near the area of proposed rezoning in Ranson have shown just how far-reaching groundwater contamination at the Ranson site could be. Results from the USGS study revealed measurable dye concentrations in Elk's Run, Rattlesnake Run, and even the Shepherdstown Town Run. This last run cuts through the center of Shepherdstown and is a favorite area for children to play and learn to fish.

Groundwater pollution is not the only concern for communities like Shepherdstown. The type of industry that ordinance #2017-302 would allow in Ranson would also generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. These pollutants are particularly harmful to children. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. The site in Ranson is across the road from an elementary school and also within the Jefferson High Middle district. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of children in Shepherdstown and all of Jefferson County.

I again request that you vote no on ordinance #2017-302. The long-term economic, environmental, and community health of municipalities like Shepherdstown depend on Ranson's participation in a coordinated zoning plan for all of Jefferson County.

Sincerely,

Gary Truitt
Shepherdstown, 25443

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask you to vote NO on Ordinance #2017-302. The industry this zoning change will allow for endangers the health, safety and, welfare of the community, and violates the premise of the smart code zoning that we have spent so much time, effort and federal money employing.

Any change in zoning needs to align with the comprehensive plan. In Ranson's current comprehensive plan (2012), the City only refers to "heavy industry" in the history section. Here it is characterized as part of a bygone era that has been replaced by an emphasis on agriculture for local food production, open spaces, and quality-of-life. In the remainder of the document, the word industry is used loosely to describe businesses including flower shops and shoe stores. Nothing that resembles the industry that this zoning change will provide for is described in the current comprehensive plan of Ranson.

In the land use section of the comprehensive plan, number ten states:

"Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The comprehensive plan clearly states that the city will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community. This change in zoning clearly negatively affects the health, safety, and welfare of the community.

As the zoning is proposed, the industry that this zoning change will allow for will be directly across the street from houses, parks and other small businesses. A densely populated subdivision and an elementary school already exit directly across the street. While these latter

community sections are not in the city limits, the effect of this zoning on them should still be considered just the same as it would be if they were in the city limits.

The industry that this zoning change will provide for will produce particulate, gaseous, and hazardous air emissions. These emissions have been shown to be detrimental to human health at every stage of life from embryo to old age. In utero and childhood exposure are the most damaging with lasting effects being realized through out life, and with maternal exposure the effects can be felt for generations. Multiple organ systems are affected including respiratory, cardiovascular, neurologic, immune, and endocrine causing defects in multiple processes including in utero development, neurodevelopment, immune and tolerance development, and cognitive defects. There are also psychological, social, and economic effects from both perceived and actual air pollution in both children and adults. Many of these effects can be seen even with short-term exposure or exposure that is lower than the levels recommended by the US Environmental Protection Agency and World Health Organization. These consequences are devastating to the individual and depressing to the local community and economy. State law does not allow a school to be built next to industry that this zoning will allow but yet we are contemplating changing the zoning so this industry can build next to a school. This does not make sense. As Ranson residents, we want Ranson to follow the lead of the state and keep polluting industry away from kids. In these ways, this change in zoning will negatively affect the health and welfare of the community.

In addition to the health effects of the air emissions is the threat to groundwater from the industry that this zoning change would allow. The land in question has karst hydrogeology and therefore very high aquifer vulnerability and is not appropriate for this industry. With the type of industry this zoning will provide for, combined with high aquifer vulnerability, the likelihood of groundwater contamination is too high for the community and region to bear. A USGS study demonstrated that contamination in the groundwater adjacent to the site moves relatively quickly and can be found in wells and surface water structures in a variety of locations in the County. In this way, contamination at the site would affect the drinking water of the great majority of Jefferson County residents. Through the surface water connections, the water at the site also affects the water resources of the region.

Aquifer vulnerability has been used by policy makers for decades to set land use regulations. The guiding document, from the WVDEP, *Stormwater Management Design in Karst Areas* states, "it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." In Ranson, we need to follow this advice and not change the zoning of this land for use by industry that has among the highest aquifer vulnerability in the County. This zoning change will endanger the safety of the community and region by endangering the safe water resources. As Ranson residents, we want to safeguard the water resources of the county and region by following the WVDEP guidance here.

Further, by reallocating this transect district and replacing it with a monolithic block of Special District Industrial designation, hundreds of housing units, parks and space for small businesses are lost. Ranson loses the potential for property tax on these properties and their improvements, Business and Occupational tax on the businesses and sales tax in retail stores. The community loses out on the opportunity to develop affordable housing and create locations where people can live, work, play, and shop all in the same place reducing the need for travel.

Worse yet apparently a deal has been made where the entity that owns the subject land has required that a litany of things not be built on the adjacent land essentially stripping the purpose of the smart code transect zone that exists there. Transect zones in the smart code are meant to transition, from out to in, and provide communities where people can safely work and live in close proximity in an effort to reduce travel. Excluding many of the components of the transect zone effectively eliminates the features that make it a transect zone, thus, losing the benefits a transect zone offers the community and city. By losing these benefits, reducing the overall and affordable housing prospects, and reducing so drastically the opportunities for city income, this zoning change will negatively affect the welfare of the community.

As Ranson residents, we find it odd that we are changing zoning to provide for industry that we would not put in the middle of our town close to our residents, but we are placing it close to the homes of county residents. Further, it is striking that the area where this change in zoning is directly adjacent to historically underserved lower income communities and a Title I school. This amounts to environmental injustice and cannot be tolerated.

The purpose of zoning is for a city to protect the health, welfare, morals and safety of the community. In this case, the air emissions and heavy truck traffic will endanger the communities' health. The threat of water contamination will endanger the safety of the community. The effect of lost productivity and decreased workforce participation due to increased illness and the negative effect the air emissions and presence of such a factory will have on the local economy will negatively affect the welfare of the community. The environmental injustice of changing the zoning to accommodate such polluting industry in a location where your municipality has no residents, but yet hundreds of low income and underserved county residents live is egregiously amoral. This must not happen. We respectfully implore you to do the right thing and vote no on ordinance #2017-302.

Sincerely,

Scott Clendenin Sr

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote NO. We moved to Jefferson county for its beauty, agriculture, history, and location. We don't want all the reasons we moved here to be affected by smokestacks, pollution, environmental repercussions and even more unknown.

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the

health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Jamie Miller

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that will significantly harm the municipalities within Jefferson County and beyond effecting the health, welfare, and safety of our community. Harpers Ferry is a national treasure with the natural and historic resources tours flock to see each year and one of the communities that will be negatively impacted by this zoning change.

According to a 2019 study by the West Virginia Tourism Office, Jefferson County generated an average of \$178 million per year in tourism-derived revenue for state and local governments over the last 10 years, more than any other county in West Virginia by at least double. Tourism benefits the businesses and economy of Ranson and Jefferson County producing \$213.7 million in individual earning, 7040 jobs, and \$842.6 million in direct spending here in 2018. We would need 40 Project Shuttles to replace the individual earnings and 59 Rockwools to replace the jobs provided by the tourism industry in Jefferson County. It is important to note that most of the money generated by tourism in Jefferson County comes from neighboring states. In this way, it is like an export: not simply recycling money, but bringing money into the state increasing its wealth. Much of the economy in Harpers Ferry is based on this tourism industry. A threat to this industry poses a threat to the economy and welfare of our community.

One of the important drivers for tourism in Harpers Ferry is the Appalachian Trail. According to the Appalachian Trail Conservancy (ATC), Harpers Ferry is the psychologic midpoint of the Trail, and hikers often plan extended stays in Jefferson County with an obvious positive impact. The ATC reports that the smokestacks and associated lights will be visible in the viewshed of 15 vistas on the Appalachian Trail (AT). Studies have shown that quality of vistas and human impact on the environment are not only noticed by visitors, but effect their experience. Another study published in the Journal of Applied Recreation Research, found that points of interests and views drew visitors' attention and had a significant impact on their perception of the trail. It was also found that particularly beautiful vistas helped visitors overlook elements

that usually have a negative effect on trail experience like increased trail traffic. A 2009 study in Leisure Sciences revealed that scenic value was a perceptual theme of Appalachian Trail visitors, and that things as simple as dead trees visible in a vista can have a negative impact on visitors' overall perception. Imagine the effect the smokestacks will have from the 15 vistas from which they will be visible. The introduction of industrial activity made possible by the proposed rezoning in Ranson would have a negative effect on the scenic views of beautiful landscapes from the Appalachian Trail in Jefferson County.

The smokestacks are not all visitors will be able to see — the air pollution will create haze. The effect of regional haze on tourists was explored in a review article published in the Atmospheric Environment titled "Impaired visibility: the air pollution people see." A key takeaway on the negative affect of haze on vacationing tourists was summarized as follows:

"Vacations offer an escape from the routine and stress of our daily lives. Vacation destinations are often chosen based on their scenery; vacations are spent gazing at monuments, mountains, clouds, and oceans. Good visibility allows clear observation of distant features and appreciation of the inherent beauty of these scenes...Air pollution, which is often present in both our cities and parks, interferes with these attributes and can ruin the views vacationers travel to enjoy."

People seek bucolic, unspoiled areas to escape the stresses of urban areas. A 2004 study in Environment and Behavior found perceived pollution causes stress while viewing natural scenes has both psychological and physiological benefits, and a 2007 study confirmed these benefits. Two other studies found that people are emotionally affected by poor visibility, and tourists are disappointed when views are obscured by haze.

The combination of smokestacks and haze will mar the viewshed and will not only reduce the positive effects of a scenic landscape but also leave tourists disappointed and dissatisfied with their choice of destination. With these effects the welfare of the Harpers Ferry community would undoubtedly be endangered by the industry that this zoning change will provide for.

Multiple studies by doctors Kozar, Doctor, and Doctor have demonstrated that the land at this site to be rezoned is Karst with the highest likelihood of sinkhole development in the county, and that the groundwater aquifer there is incredibly sensitive to contamination from surface water. Further, this site is on an upland plain with relatively few surface streams, seasonal variability in the water table that results in numerous estavelles, and large amounts of water in the epikarst. In this area contamination in surface water communicates easily to the water in the epikarst via diffuse and point infiltration, and the springs at the margins of the upland area are directly affected by the water quality throughout the aquifer. According to Jefferson Orchards Voluntary Remediation Plan with the WVDEP, the groundwater at the site is approximately 60 feet below the ground, and the tests performed by the USGS have shown that groundwater from just adjacent to this site emerged in the headwaters of both the Elk's Run and Rattlesnake Run. This is critically important for Harpers Ferry because the Elk's Run headwaters is a spring about three miles southeast of the site and goes on to become the drinking water source for Harpers Ferry and Bolivar before emptying into the Potomac River.

The headwaters of Rattlesnake Run is a spring about 3.5 miles from the site and is also a tributary of the Potomac River. The Potomac River is the back up water source for Harpers Ferry. This means that the activity at the site will have a critical influence on the drinking water of Harpers Ferry. In this was the industry permitted by this change in zoning would undoubtedly endanger the health and safety of the community in Harpers Ferry.

The untoward health effects and individual economic consequences from the pollution emissions of the industry this rezoning will allow that will be born out over the length of people's lives and that of their decedents for at least three generations is an egregious example of environmental injustice that should not be tolerated. This zoning change may be in one of the poorest sections of the county, but the effects will be felt in every part of Ranson and the county.

The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." The industry that this rezoning will allow will jeopardize the health, safety and welfare of Ranson, Harpers Ferry and the whole county. Please vote no on the ordinance #2017-302.

Sincerely,

Trevor Hawthorne

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The city has failed to address the latter part of this objective. By Changing the SDI in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and child hood as development is exquisitely sensitive during these times, but the effects are realized through out life negatively impacting a variety of lifetime parameters including physical and mental health, and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that will significantly harm the municipalities within Jefferson County and beyond effecting the health, welfare, and safety of our community. Harpers Ferry is a national treasure with the natural and historic resources tours flock to see each year and one of the communities that will be negatively impacted by this zoning change.

According to a 2019 study by the West Virginia Tourism Office, Jefferson County generated an average of \$178 million per year in tourism-derived revenue for state and local governments over the last 10 years, more than any other county in West Virginia by at least double. Tourism benefits the businesses and economy of Ranson and Jefferson County producing \$213.7 million in individual earning, 7040 jobs, and \$842.6 million in direct spending here in 2018. We would need 40 Project Shuttles to replace the individual earnings and 59 Rockwools to replace the jobs provided by the tourism industry in Jefferson County. It is important to note that most of the money generated by tourism in Jefferson County comes from neighboring states. In this way, it is like an export: not simply recycling money, but bringing money into the state increasing its wealth. Much of the economy in Harpers Ferry is based on this tourism industry. A threat to this industry poses a threat to the economy and welfare of our community.

One of the important drivers for tourism in Harpers Ferry is the Appalachian Trail. According to the Appalachian Trail Conservancy (ATC), Harpers Ferry is the psychologic midpoint of the Trail, and hikers often plan extended stays in Jefferson County with an obvious positive impact. The ATC reports that the smokestacks and associated lights will be visible in the viewshed of 15 vistas on the Appalachian Trail (AT). Studies have shown that quality of vistas and human impact on the environment are not only noticed by visitors, but effect their experience. Another study published in the Journal of Applied Recreation Research, found that points of interests and views drew visitors' attention and had a significant impact on their perception of the trail. It was also found that particularly beautiful vistas helped visitors overlook elements

that usually have a negative effect on trail experience like increased trail traffic. A 2009 study in Leisure Sciences revealed that scenic value was a perceptual theme of Appalachian Trail visitors, and that things as simple as dead trees visible in a vista can have a negative impact on visitors' overall perception. Imagine the effect the smokestacks will have from the 15 vistas from which they will be visible. The introduction of industrial activity made possible by the proposed rezoning in Ranson would have a negative effect on the scenic views of beautiful landscapes from the Appalachian Trail in Jefferson County.

The smokestacks are not all visitors will be able to see — the air pollution will create haze. The effect of regional haze on tourists was explored in a review article published in the Atmospheric Environment titled "Impaired visibility: the air pollution people see." A key takeaway on the negative affect of haze on vacationing tourists was summarized as follows:

"Vacations offer an escape from the routine and stress of our daily lives. Vacation destinations are often chosen based on their scenery; vacations are spent gazing at monuments, mountains, clouds, and oceans. Good visibility allows clear observation of distant features and appreciation of the inherent beauty of these scenes...Air pollution, which is often present in both our cities and parks, interferes with these attributes and can ruin the views vacationers travel to enjoy."

People seek bucolic, unspoiled areas to escape the stresses of urban areas. A 2004 study in Environment and Behavior found perceived pollution causes stress while viewing natural scenes has both psychological and physiological benefits, and a 2007 study confirmed these benefits. Two other studies found that people are emotionally affected by poor visibility, and tourists are disappointed when views are obscured by haze.

The combination of smokestacks and haze will mar the viewshed and will not only reduce the positive effects of a scenic landscape but also leave tourists disappointed and dissatisfied with their choice of destination. With these effects the welfare of the Harpers Ferry community would undoubtedly be endangered by the industry that this zoning change will provide for.

Multiple studies by doctors Kozar, Doctor, and Doctor have demonstrated that the land at this site to be rezoned is Karst with the highest likelihood of sinkhole development in the county, and that the groundwater aquifer there is incredibly sensitive to contamination from surface water. Further, this site is on an upland plain with relatively few surface streams, seasonal variability in the water table that results in numerous estavelles, and large amounts of water in the epikarst. In this area contamination in surface water communicates easily to the water in the epikarst via diffuse and point infiltration, and the springs at the margins of the upland area are directly affected by the water quality throughout the aquifer. According to Jefferson Orchards Voluntary Remediation Plan with the WVDEP, the groundwater at the site is approximately 60 feet below the ground, and the tests performed by the USGS have shown that groundwater from just adjacent to this site emerged in the headwaters of both the Elk's Run and Rattlesnake Run. This is critically important for Harpers Ferry because the Elk's Run headwaters is a spring about three miles southeast of the site and goes on to become the drinking water source for Harpers Ferry and Bolivar before emptying into the Potomac River.

The headwaters of Rattlesnake Run is a spring about 3.5 miles from the site and is also a tributary of the Potomac River. The Potomac River is the back up water source for Harpers Ferry. This means that the activity at the site will have a critical influence on the drinking water of Harpers Ferry. In this was the industry permitted by this change in zoning would undoubtedly endanger the health and safety of the community in Harpers Ferry.

The untoward health effects and individual economic consequences from the pollution emissions of the industry this rezoning will allow that will be born out over the length of people's lives and that of their decedents for at least three generations is an egregious example of environmental injustice that should not be tolerated. This zoning change may be in one of the poorest sections of the county, but the effects will be felt in every part of Ranson and the county.

The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." The industry that this rezoning will allow will jeopardize the health, safety and welfare of Ranson, Harpers Ferry and the whole county. Please vote no on the ordinance #2017-302. As an individual who was privileged to be born and raised in Harpers Ferry, and as a current Masters in City Planning graduate student at MIT, I implore you to vote no and instead support alternative smart growth development strategies (like transit-oriented development) that will sustain our region for years to come.

Sincerely,

Seth Wight

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The city has failed to address the latter part of this objective. By Changing the SDI in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and child hood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health, and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and overall earnings for owners, breeders, and

trainers. This group provides over 70 million dollars in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. This industry would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitorship and again decreasing return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up this industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the Karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive plan is clear the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Anne Munro

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that will significantly harm the municipalities within Jefferson County and beyond effecting the health, welfare, and safety of our community. Harpers Ferry is a national treasure with the natural and historic resources tours flock to see each year and one of the communities that will be negatively impacted by this zoning change.

According to a 2019 study by the West Virginia Tourism Office, Jefferson County generated an average of \$178 million per year in tourism-derived revenue for state and local governments over the last 10 years, more than any other county in West Virginia by at least double. Tourism benefits the businesses and economy of Ranson and Jefferson County producing \$213.7 million in individual earning, 7040 jobs, and \$842.6 million in direct spending here in 2018. We would need 40 Project Shuttles to replace the individual earnings and 59 Rockwools to replace the jobs provided by the tourism industry in Jefferson County. It is important to note that most of the money generated by tourism in Jefferson County comes from neighboring states. In this way, it is like an export: not simply recycling money, but bringing money into the state increasing its wealth. Much of the economy in Harpers Ferry is based on this tourism industry. A threat to this industry poses a threat to the economy and welfare of our community.

One of the important drivers for tourism in Harpers Ferry is the Appalachian Trail. According to the Appalachian Trail Conservancy (ATC), Harpers Ferry is the psychologic midpoint of the Trail, and hikers often plan extended stays in Jefferson County with an obvious positive impact. The ATC reports that the smokestacks and associated lights will be visible in the viewshed of 15 vistas on the Appalachian Trail (AT). Studies have shown that quality of vistas and human impact on the environment are not only noticed by visitors, but effect their experience. Another study published in the Journal of Applied Recreation Research, found that points of interests and views drew visitors' attention and had a significant impact on their perception of the trail. It was also found that particularly beautiful vistas helped visitors overlook elements

that usually have a negative effect on trail experience like increased trail traffic. A 2009 study in Leisure Sciences revealed that scenic value was a perceptual theme of Appalachian Trail visitors, and that things as simple as dead trees visible in a vista can have a negative impact on visitors' overall perception. Imagine the effect the smokestacks will have from the 15 vistas from which they will be visible. The introduction of industrial activity made possible by the proposed rezoning in Ranson would have a negative effect on the scenic views of beautiful landscapes from the Appalachian Trail in Jefferson County.

The smokestacks are not all visitors will be able to see — the air pollution will create haze. The effect of regional haze on tourists was explored in a review article published in the Atmospheric Environment titled "Impaired visibility: the air pollution people see." A key takeaway on the negative affect of haze on vacationing tourists was summarized as follows:

"Vacations offer an escape from the routine and stress of our daily lives. Vacation destinations are often chosen based on their scenery; vacations are spent gazing at monuments, mountains, clouds, and oceans. Good visibility allows clear observation of distant features and appreciation of the inherent beauty of these scenes...Air pollution, which is often present in both our cities and parks, interferes with these attributes and can ruin the views vacationers travel to enjoy."

People seek bucolic, unspoiled areas to escape the stresses of urban areas. A 2004 study in Environment and Behavior found perceived pollution causes stress while viewing natural scenes has both psychological and physiological benefits, and a 2007 study confirmed these benefits. Two other studies found that people are emotionally affected by poor visibility, and tourists are disappointed when views are obscured by haze.

The combination of smokestacks and haze will mar the viewshed and will not only reduce the positive effects of a scenic landscape but also leave tourists disappointed and dissatisfied with their choice of destination. With these effects the welfare of the Harpers Ferry community would undoubtedly be endangered by the industry that this zoning change will provide for.

Multiple studies by doctors Kozar, Doctor, and Doctor have demonstrated that the land at this site to be rezoned is Karst with the highest likelihood of sinkhole development in the county, and that the groundwater aquifer there is incredibly sensitive to contamination from surface water. Further, this site is on an upland plain with relatively few surface streams, seasonal variability in the water table that results in numerous estavelles, and large amounts of water in the epikarst. In this area contamination in surface water communicates easily to the water in the epikarst via diffuse and point infiltration, and the springs at the margins of the upland area are directly affected by the water quality throughout the aquifer. According to Jefferson Orchards Voluntary Remediation Plan with the WVDEP, the groundwater at the site is approximately 60 feet below the ground, and the tests performed by the USGS have shown that groundwater from just adjacent to this site emerged in the headwaters of both the Elk's Run and Rattlesnake Run. This is critically important for Harpers Ferry because the Elk's Run headwaters is a spring about three miles southeast of the site and goes on to become the drinking water source for Harpers Ferry and Bolivar before emptying into the Potomac River.

The headwaters of Rattlesnake Run is a spring about 3.5 miles from the site and is also a tributary of the Potomac River. The Potomac River is the back up water source for Harpers Ferry. This means that the activity at the site will have a critical influence on the drinking water of Harpers Ferry. In this was the industry permitted by this change in zoning would undoubtedly endanger the health and safety of the community in Harpers Ferry.

The untoward health effects and individual economic consequences from the pollution emissions of the industry this rezoning will allow that will be born out over the length of people's lives and that of their decedents for at least three generations is an egregious example of environmental injustice that should not be tolerated. This zoning change may be in one of the poorest sections of the county, but the effects will be felt in every part of Ranson and the county.

The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." The industry that this rezoning will allow will jeopardize the health, safety and welfare of Ranson, Harpers Ferry and the whole county. Please vote no on the ordinance #2017-302.

In addition, as a community member who also has asthma, the general quality of the air we all breath is essential to remain as pure as possible for myself as well as all others. The abundant natural world that is thriving here in Jefferson County is at risk with the development of Rockwool and any other potential future heavy industry moving in, that are not required to adhere to the strictest of environmental standards, for the health and safety of everyone. Lastly, full community acceptance is also essential, as without only strife, stress and community division will result.

Sincerely,

Di Roman

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The city has failed to address the latter part of this objective. By Changing the SDI in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and child hood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health, and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and overall earnings for owners, breeders, and

trainers. This group provides over 70 million dollars in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. This industry would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitorship and again decreasing return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up this industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the Karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive plan is clear the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on #2017-302. The air emissions, possibility of ground and surface water contamination, and their effect on our interwoven economies threaten the health, safety and welfare of not just Jefferson County but the greater region, including Loudoun and the greater Northern Virginia area.

This zoning would provide for industry that produces large amounts of air emissions. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. Northern Virginia is directly downwind from these emissions. Much of the gaseous, fine particulate, and hazardous emissions can reach Northern Virginia. Further affecting the outdoor air quality of the adjacent portion of Virginia and the ability of these areas to achieve and maintain National Ambient Air Quality Standards (NAAQS) attainment. This will affect agriculture and outdoor leisure and recreation.

For example, Loudoun County has been in nonattainment for the NAAQS 8-hour Ozone standard for the past two years. VOC and NO_x react after they have been emitted to produce ground level ozone. The industry that this rezoning would provide for would produce large amounts of these emissions. This would make it even harder as Loudoun County tries to achieve attainment. As time goes on and the scientific research advances our knowledge and understanding of the extent to which gaseous, particulate and hazardous emissions affect human health the NAAQS standards are likely to be reduced. The effects on air emission from this rezoning will make it only harder for Loudoun and Northern Virginia to meet these standards.

In addition to the concerns about the air, the possible ground and surface water contamination is very concerning to Loudoun and Virginia residents. The site is known to have ground water that is vulnerable to contamination due to the karst hydrogeology. A USGS study demonstrated that the ground water adjacent to the site to be rezoned communicates readily with surface

water tributaries of the Potomac River. In addition to direct infiltration where water moves directly from the surface to groundwater via porous limestone bedrock, karst is known to have severe ground instability problems. This makes karst geology prone to sinkhole development. Sinkholes provide direct connection between the surface water and any contaminants it may contain and the groundwater. This makes the aquifer vulnerability in karst areas very high, and contamination with industrial activity such as that provided for by this rezoning too likely.

Loudoun sources its drinking water from the Potomac River, downstream of many West Virginia tributaries that carry water from the epikarst and groundwater aquifer at the site to be rezoned. Loudoun has recently completed the new Trap Rock Water Treatment facility, which draws water from the Potomac River. Loudoun currently provides 40 million gallons and projects to provide 90 million gallons of drinking water a day to customers by 2040 (Loudounwater.org). Therefore, the viability of the Potomac River is a high priority for Virginia residents.

Loudoun and Northern Virginia is one of the fastest growing communities in the country and provides a lot to Jefferson County in their symbiotic relationship. Virginia residents support and enjoy Jefferson County through tourism, as our residents enjoy the natural and historical resources of your county. Virginia residents and businesses support the equine industry in a multitude of ways from providing wagering fans at the races to the Virginia Breeders Association Virginia Certified incentive programs and a strong market for retired racehorses. According to an economic impact study from WVU, at least 40% of Jefferson County residents travel outside of West Virginia for work, a good percentage of those travel to northern Virginia. This rezoning would allow for industry that would negatively affect the economy of both places and this relationship and the benefits for our residents gleaned from it.

This zoning change will provide for industry that will negatively effect the health safety and welfare of the Loudon and Northern Virginia community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

joyce p gedeon

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The city has failed to address the latter part of this objective. By Changing the SDI in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and child hood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health, and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and overall earnings for owners, breeders, and

trainers. This group provides over 70 million dollars in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. This industry would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitorship and again decreasing return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up this industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the Karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive plan is clear the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Jayne O’Hara

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would negatively affect tourism, economic agility, groundwater quality, and individual health in neighboring municipalities like Shepherdstown.

Tourism is critically important to Shepherdstown's economy and to the county as a whole. In 2018, tourist spending in the Jefferson County contributed over \$170 million to state and local government revenue and \$213 million in individual earnings. Importantly, most of this money comes from tourists visiting from neighboring states like Virginia, Maryland, and Washington D.C. Out-of-state tourists are largely drawn to Jefferson County because of its reputation for environmental-friendly, sustainable industry. Key elements that support this reputation include the county's pastoral scenery and pristine natural resources. Ordinance #2017-302 will allow industry into Jefferson County that risks harming these elements and dramatically reducing the area's appeal to visitors. The resulting harm to our tourist industry would drive away visitors and decrease state, county, and local revenue. The long-term success of Jefferson County's tourism industry is dependent on local governments making coordinated zoning decisions. Allowing certain types in industry in Ranson will negatively affect tourism in every municipality throughout the county, including Shepherdstown. Voting no on ordinance #2017-302 will protect the foundations of the county's tourism industry and protect the 7,040 jobs in Jefferson County that are directly supported by tourism.

The type of large, consolidated industry that ordinance #2017-302 would allow in Ranson would generally reduce the flexibility of local economies in Jefferson County. Historically, the driving industries in Jefferson County have been tourism, agriculture, and the equine industries. These three industries are large conglomerates of small businesses. Small business is very important to Sheherdstown. Small businesses have been shown to create more jobs, cultivate more innovation, and provide more opportunities than big, non-local firms. Additionally, small businesses have been shown to more reactive to sudden changes relative to manufacturing

businesses. Bringing large, manufacturing-based industry into Jefferson county will depress the local economy and stifle innovation. During this time of economic upheaval and uncertainty, Jefferson County needs to support industries that will allow local economies to adapt and recover as fast as possible.

Voting no on ordinance #2017-302 will help protect water resources throughout Jefferson County. The type of industry that ordinance #2017-302 would allow puts the ground resources of Jefferson county at significant risk due to the karst hydrogeology. The site in Ranson is in the Rocky Marsh Run watershed, which is in the source water protection zone for Shepherdstown and drains to the Potomac River. Therefore, activity at this site will affect both groundwater and surface water streams. In municipalities like Shepherdstown, many residents and nearby farms depend on wells for water. Contamination of groundwater aquifers would create both health and remediation concerns for local residents. Dye tests performed by the USGS near the area of proposed rezoning in Ranson have shown just how far-reaching groundwater contamination at the Ranson site could be. Results from the USGS study revealed measurable dye concentrations in Elk's Run, Rattlesnake Run, and even the Shepherdstown Town Run. This last run cuts through the center of Shepherdstown and is a favorite area for children to play and learn to fish.

Groundwater pollution is not the only concern for communities like Shepherdstown. The type of industry that ordinance #2017-302 would allow in Ranson would also generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. These pollutants are particularly harmful to children. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. The site in Ranson is across the road from an elementary school and also within the Jefferson High Middle district. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of children in Shepherdstown and all of Jefferson County.

I again request that you vote no on ordinance #2017-302. The long-term economic, environmental, and community health of municipalities like Shepherdstown depend on Ranson's participation in a coordinated zoning plan for all of Jefferson County.

Sincerely,

Todd Cotgreave

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would have a negative effect on water and air quality in neighboring states such as Maryland.

The Potomac River provides drinking water and a source of recreation to Maryland residents. Water and air pollution generated within the Potomac River's watershed will inevitably contaminate this valuable waterway. The site of the proposed zoning change in Ranson is located within the Potomac River Watershed.

The type of industry that ordinance #2017-30 would allow in Ranson would utilize large water impoundments, in an area of known karst terrain. This water will be contaminant from several sources including particulate mater that has fallen out from the air emissions and process water. The West Virginia Department of Environmental Protection has published guidelines that specifically discourage extensive development in areas of karst terrain because of the vulnerability of karst aquifers to contamination by surface pollution. Karst features increase surface water and groundwater connectivity and any spills or surface releases quickly percolate into the groundwater. Additionally, sinkholes are common in karst terrain and can cause ruptures in wastewater impoundments. Even if appropriate attempts are made to contain and manage wastewater and other stormwater runoff on-site, there is still a high risk that wastewater could contaminate the groundwater through tears and catastrophic failure of wastewater impoundments. Contaminated groundwater in karst terrain can easily resurface in waterways several miles away, as shown by a USGS tracer study conducted near the site in to be rezoned. The USGS study detected tracer dye in multiple springs and waterways miles from the initial injection site in Ranson. All of these waterways drain into the Potomac River.

Mismanagement of wastewater could also lead to contamination of nearby surface waters. For example, the site of the proposed rezoning in Ranson is in the Rocky Marsh Run watershed.

Rocky Marsh Run also drains to the Potomac River. Voting no on ordinance #2017-302 will preserve downstream water quality and help ensure that the Potomac River remains usable for Maryland residents.

Air pollution poses another risk to Maryland residents. The type of industry that ordinance #2017-302 would allow would generate air pollutants like fine particulate matter. According to the US EPA, fine particulates can travel 100s of miles from its original source. Air pollution related to industrial activity in Ranson could easily reach Maryland. Fine particulates have a greater affinity for carrying toxic compounds and their small size allows them to be inhaled more deeply into the lungs. Chronic exposure to fine particulate matter is associated with increased risk of several diseases including Alzheimer's in adults. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease among others. Fine particulate matter also exacerbates regional haze which creates a visible reminder of air pollution. The psychological effects that arise from an increased perception of pollution include stress, anxiety, and unhappiness. Voting no on ordinance #2017-302 will help prevent increased air pollution from negatively affecting the long-term health of Maryland residents.

I again request that you vote no on ordinance #2017-302. Zoning decisions in Ranson and Jefferson County have an undeniable influence on the quality of life in neighboring states.

Sincerely,

Timothy Burke

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on #2017-302. The air emissions, possibility of ground and surface water contamination, and their effect on our interwoven economies threaten the health, safety and welfare of not just Jefferson County but the greater region, including Loudoun and the greater Northern Virginia area.

This zoning would provide for industry that produces large amounts of air emissions. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. Northern Virginia is directly downwind from these emissions. Much of the gaseous, fine particulate, and hazardous emissions can reach Northern Virginia. Further affecting the outdoor air quality of the adjacent portion of Virginia and the ability of these areas to achieve and maintain National Ambient Air Quality Standards (NAAQS) attainment. This will affect agriculture and outdoor leisure and recreation.

For example, Loudoun County has been in nonattainment for the NAAQS 8-hour Ozone standard for the past two years. VOC and NO_x react after they have been emitted to produce ground level ozone. The industry that this rezoning would provide for would produce large amounts of these emissions. This would make it even harder as Loudoun County tries to achieve attainment. As time goes on and the scientific research advances our knowledge and understanding of the extent to which gaseous, particulate and hazardous emissions affect human health the NAAQS standards are likely to be reduced. The effects on air emission from this rezoning will make it only harder for Loudoun and Northern Virginia to meet these standards.

In addition to the concerns about the air, the possible ground and surface water contamination is very concerning to Loudoun and Virginia residents. The site is known to have ground water that is vulnerable to contamination due to the karst hydrogeology. A USGS study demonstrated that the ground water adjacent to the site to be rezoned communicates readily with surface

water tributaries of the Potomac River. In addition to direct infiltration where water moves directly from the surface to groundwater via porous limestone bedrock, karst is known to have severe ground instability problems. This makes karst geology prone to sinkhole development. Sinkholes provide direct connection between the surface water and any contaminants it may contain and the groundwater. This makes the aquifer vulnerability in karst areas very high, and contamination with industrial activity such as that provided for by this rezoning too likely.

Loudoun sources its drinking water from the Potomac River, downstream of many West Virginia tributaries that carry water from the epikarst and groundwater aquifer at the site to be rezoned. Loudoun has recently completed the new Trap Rock Water Treatment facility, which draws water from the Potomac River. Loudoun currently provides 40 million gallons and projects to provide 90 million gallons of drinking water a day to customers by 2040 (Loudounwater.org). Therefore, the viability of the Potomac River is a high priority for Virginia residents.

Loudoun and Northern Virginia is one of the fastest growing communities in the country and provides a lot to Jefferson County in their symbiotic relationship. Virginia residents support and enjoy Jefferson County through tourism, as our residents enjoy the natural and historical resources of your county. Virginia residents and businesses support the equine industry in a multitude of ways from providing wagering fans at the races to the Virginia Breeders Association Virginia Certified incentive programs and a strong market for retired racehorses. According to an economic impact study from WVU, at least 40% of Jefferson County residents travel outside of West Virginia for work, a good percentage of those travel to northern Virginia. This rezoning would allow for industry that would negatively affect the economy of both places and this relationship and the benefits for our residents gleaned from it.

This zoning change will provide for industry that will negatively effect the health safety and welfare of the Loudon and Northern Virginia community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Michael Schimmel

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Please do your duty as a representative of the people of this community by:

- (1) Upholding the stated standards of the Comprehensive Plan as mentioned above.
- (2) Recognizing that a large number of the residents in this area do not want this kind of development, and that it is your job to represent their desires and not the wishes of corporations or interests at the State level.

Sincerely,

David Barlow

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

I moved out of WV last year after living in WV for 26 glorious years and I thought I would die there. But the deceit and corruption of our local and state governments forced me out of WV- I no longer wanted to be part of a county that would sell the health of it's citizens to the highest bidder, so I moved and brought my money with me (the only thing the elected officials value) to another state. I left WV 1 week after my next door neighbor left WV, trying to get out before the housing market tanked.

I spent hundreds of hours going to town meetings, reading past transcripts from all committees involved in Rockwool and listening to and watching videos of the decision makers who sold us down the stream and realized it wasn't how I wanted to spend my retirement years. As a retired ICU RN, I know what Rockwool will do to our community- no spin or lie will be able to disprove 41 years of medical experience that I lived with on a daily basis.

So I say "Fuck you Ranson. Fuck you for lying to us. Fuck you for continuing to lie to us. I pray you wake up one day to realize what you have tried to do to the entire world... for we all share the same water and air.

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will

endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would negatively affect tourism, economic agility, groundwater quality, and individual health in neighboring municipalities like Shepherdstown.

Tourism is critically important to Shepherdstown's economy and to the county as a whole. In 2018, tourist spending in the Jefferson County contributed over \$170 million to state and local government revenue and \$213 million in individual earnings. Importantly, most of this money comes from tourists visiting from neighboring states like Virginia, Maryland, and Washington D.C. Out-of-state tourists are largely drawn to Jefferson County because of its reputation for environmental-friendly, sustainable industry. Key elements that support this reputation include the county's pastoral scenery and pristine natural resources. Ordinance #2017-302 will allow industry into Jefferson County that risks harming these elements and dramatically reducing the area's appeal to visitors. The resulting harm to our tourist industry would drive away visitors and decrease state, county, and local revenue. The long-term success of Jefferson County's tourism industry is dependent on local governments making coordinated zoning decisions. Allowing certain types in industry in Ranson will negatively affect tourism in every municipality throughout the county, including Shepherdstown. Voting no on ordinance #2017-302 will protect the foundations of the county's tourism industry and protect the 7,040 jobs in Jefferson County that are directly supported by tourism.

The type of large, consolidated industry that ordinance #2017-302 would allow in Ranson would generally reduce the flexibility of local economies in Jefferson County. Historically, the driving industries in Jefferson County have been tourism, agriculture, and the equine industries. These three industries are large conglomerates of small businesses. Small business is very important to Sheherdstown. Small businesses have been shown to create more jobs, cultivate more innovation, and provide more opportunities than big, non-local firms. Additionally, small businesses have been shown to more reactive to sudden changes relative to manufacturing

businesses. Bringing large, manufacturing-based industry into Jefferson county will depress the local economy and stifle innovation. During this time of economic upheaval and uncertainty, Jefferson County needs to support industries that will allow local economies to adapt and recover as fast as possible.

Voting no on ordinance #2017-302 will help protect water resources throughout Jefferson County. The type of industry that ordinance #2017-302 would allow puts the ground resources of Jefferson county at significant risk due to the karst hydrogeology. The site in Ranson is in the Rocky Marsh Run watershed, which is in the source water protection zone for Shepherdstown and drains to the Potomac River. Therefore, activity at this site will affect both groundwater and surface water streams. In municipalities like Shepherdstown, many residents and nearby farms depend on wells for water. Contamination of groundwater aquifers would create both health and remediation concerns for local residents. Dye tests performed by the USGS near the area of proposed rezoning in Ranson have shown just how far-reaching groundwater contamination at the Ranson site could be. Results from the USGS study revealed measurable dye concentrations in Elk's Run, Rattlesnake Run, and even the Shepherdstown Town Run. This last run cuts through the center of Shepherdstown and is a favorite area for children to play and learn to fish.

Groundwater pollution is not the only concern for communities like Shepherdstown. The type of industry that ordinance #2017-302 would allow in Ranson would also generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. These pollutants are particularly harmful to children. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. The site in Ranson is across the road from an elementary school and also within the Jefferson High Middle district. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of children in Shepherdstown and all of Jefferson County.

We love our home on Shannondale lake and we, along with several friends, are all now considering buying another property for retirement in Shepherdstown. this type of industry is a big deterrent. I again request that you vote no on ordinance #2017-302. The long-term economic, environmental, and community health of municipalities like Shepherdstown depend on Ranson's participation in a coordinated zoning plan for all of Jefferson County.

Sincerely,

Amy Kostant

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The city has failed to address the latter part of this objective. By Changing the SDI in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and child hood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health, and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and overall earnings for owners, breeders, and

trainers. This group provides over 70 million dollars in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. This industry would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitorship and again decreasing return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up this industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the Karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive plan is clear the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Anne Stackpole

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would put at risk the health and well being of children of Jefferson County.

The type of industry that ordinance #2017-302 would allow in Ranson would generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. Exposure to these pollutants has devastating effects on children's health. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. Developing fetuses whose mothers are exposed to air pollution are more likely to have impaired organ development which can lead to early cognitive deficits, neurodevelopmental defects and other physical, cognitive, and psychological deficits later in life. An association between autism and prenatal exposure to particulate matter in air pollution has been demonstrated in several studies. Many studies have shown that lower test scores in math, English, and language arts are associated with exposure to outdoor air pollution. Industrial activity allowed by ordinance #2017-302 would also increase the risk of groundwater contamination in Ranson and nearby municipalities. Children whose families rely on well water, as is the case in much of Jefferson County, may be affected by polluted water. Voting no on ordinance #2017-302 will prevent air and water pollution from negatively affecting the long-term health of children in Jefferson County and surrounding areas.

The economic and environmental harm caused by the type of industry that ordinance #2017-302 would allow would put additional stress on the parents, caretakers, and teachers of children in affected areas. The weakening and destabilizing of this support network would have negative effects on local children. Many households in Jefferson County depend on the local agriculture, tourism, and equine industries for income. If industrial activity in Ranson depresses these industries, the resulting financial strain on these households will introduce additional

stress and uncertainty into children's lives. Households living in areas affected by particulate matter and regional haze will also suffer from the psychological effects of air pollution. Individuals living in areas with increase perception of pollution show increased levels of stress, anxiety, and unhappiness. School districts affected by increased air and water pollution may have trouble recruiting and retaining teachers. Teachers have a large influence on a child's daily life and, if educator quality and tenure decreases, the quality of this influence will diminish.

The site of the proposed rezoning in Ranson is across the road from an elementary school and proximal to lower-income neighborhoods. Observations like these demonstrate how ordinance #2017-302 would disproportionately affect vulnerable and historically-disadvantaged populations. The damaging health effects of air pollution have been shown to persist for at least three generations, so allowing certain types of industry in low-income areas would only compound existing disadvantages. Voting no on ordinance #2017-302 would be a step towards acknowledging that all individuals have the right to clean air and water.

Children face increased exposure to air pollution, groundwater contamination, financial instability, and environmental discrimination if ordinance #2017-302 is passed. Please vote no on ordinance #2017-302.

Sincerely,

Heather Maravas

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

I submit that an re-written amendment allowing the existing ordinance to cover the property currently being developed by Rockwool be approved and that all remaining property in the tract be limited to the zoning regulations of light industrial like the fine businesses in Burr Industrial Park may be an acceptable solution for all.

I support planned, smart growth, in Jefferson County by the People and our Elected County, Cities, Towns and Municipality Leaders when done properly.

In 2014 and into 2015 many Jefferson County Residents participated in the planning process to help define what Jefferson County should look like in 2035. The process and meetings were energetic, civil and possessed a good balance of growth / no-growth views to the County.

When I look thru the documents I clearly see reference to;

- respect for the quality of place

- Natural beauty
- Rural landscape
- Historic value
- Culture
- And a balance with needed growth

And I overlay the Economic Objectives and action plans between in Jefferson County Comprehensive Plan and the Ranson Comprehensive Plan I find very similar objectives, and curious reference to Ranson ...began its slow transition from heavy industry... Despite the challenges of the job losses due to a decreasing base of heavy industrial manufacturing... Ranson has significantly lower unemployment....than the US national average... The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community...

In review of the information I found about Jefferson Orchards decision to 'close up shop', I was saddened to learn of this once thriving business was closing, but appeared to have a vision of a planned mixed use community. It appears when Jefferson Orchards decided to close up shop, and applied to the County, that application was met with opposition, which apparently led to the shoestring annexation into the City of Ranson and a well-defined land development plan and application.

None of my research leads me to believe that major/heavy industry was a plan or on the table in 2012-2015.

Wikipedia states; ...reliance on heavy industry is typically a matter of government economic policy...

If we support industrial growth in Jefferson County what do we need?

- Natural gas
- Sewer
- Water
- High speed internet
- A talented work force

If the Feds and the State are willing to pay the way for infrastructure opposed to rate payer increases what is the hidden cost or risk to the Community?

So here we are in 2020 discussing the authorization to allow more major/heavy industry into our rural landscape. This is not what the citizens of Jefferson County Planned for in the envision 2035 plan.

Sincerely,

Neal Nilsen

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask that you vote no on Ordinance #2017-302. While not in Ranson, the land and homes around the property that is the subject of the zoning change are closer to the property than anyone who currently lives within the city limits of Ranson. This area will be affected sooner and more harshly by the environmental issues that will develop secondary to the inappropriate siting of industry this zoning would allow.

The subject land has been well studied by Drs. Kozar, Doctor and Doctor and described in the scientific literature and USGS reports as having karst hydrology with very high aquifer vulnerability. The karst landscape is a consequence of the presence of soluble bedrock, which consists of limestone in the case of the subject land. In such landscapes water percolates through the ground and dissolves the underlying rock creating a porous network of caverns and throughways. Karst aquifers are known to be "extremely vulnerable to pollution" due to direct connection between the surface water and groundwater through both point (sinkholes) and diffuse (everywhere) infiltration. It is known from the Voluntary Remediation Plan of Jefferson Orchard that the groundwater at the subject site is only 60 feet below the ground. The subject property and much of the property around it are on an upland plain with few surface streams, but great seasonal variability in the water table resulting in numerous esteves and large amounts of water in the epikarst. This water is easily contaminated and this contamination spreads quickly throughout the aquifer. Dye tests performed near the subject site by the USGS have demonstrated this quick moving thorough dispersment in the aquifer in this area. While this contamination goes on to affect springs at the margins of the upland area continuing on in streams that service municipal water sources and the Potomac River, our concerns are far more immediate in both time and distance. Well water is the only water source available in the area of the proposed zoning change and, with the exception of Fox Glen, a majority of this water is supplied by private wells. Therefore, the groundwater aquifer fulfills a critical necessity, fulfilling all needs including human consumption, household uses, and agriculture and

maintenance of livestock and horses in the immediate area around the site. The concern is that if the aquifer becomes contaminated, then the local drinking water will be fouled.

For decades now, policy makers have been using “Aquifer Vulnerability,” to set land use and water resource protection policy. Karst has very high Aquifer Vulnerability. Therefore, this industrial use is not appropriate for this land and it should not be zoned for it. The guiding documents of the WVDEP recognize this. The introduction to the WVDEP document *Stormwater Management Design in Karst Areas* states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.”

The Chesapeake Bay Stormwater Network karst stormwater guidance document the *CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed*, which the WVDEP cites in its own guiding document *Stormwater Management Design in Karst Areas*, clearly agrees stating

“First, the effect of land development on karst terrain is complex and hard to predict, and requires professional analysis to reduce the risk of geological hazards, damage to infrastructure and groundwater contamination.”

“The working group acknowledges that past approaches to stormwater and land development in karst terrain have been inadequate to safeguard the public and the environment.”

“...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.”

We clearly need stronger comprehensive land use plans and zoning that direct new growth away from karst areas to more appropriate locations. Ordinance #2017-302 is literally the opposite of this.

Further, we cannot rely on the WVDEP to do the job that good local land use guidelines and zoning should do. For example, the *CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed* states that detention and retention ponds are not recommended on karst and categorize them as discouraged. Also, quoting WVDEP’s own karst guidance: “attenuating surface runoff will increase the rate of sinkhole formation and potential groundwater contamination.” Yet the entity currently planning to utilize this zoning change is planning employment of multiple massive retention ponds and attenuating surface runoff completely. This has already been approved by the DEP in two Construction Stormwater General Permit registrations for that company. One of detention ponds is not even regulated by the DEP as it contains process water and has no outlet. Clearly the DEP recognizes the risks but is not appropriately limiting them. Relying on the DEP to protect the public health, safety, welfare, and the environment from any entity in these karst locations is simply as the CNS bulletin said it “inadequate to safeguard the public and the environment.” We must have appropriate zoning that takes into consideration appropriate use of land with karst

hydrogeology. Ordinance #2017-302 does not do this, but instead increases the risk to the public and the environment.

A second serious concern is the air emissions from the industry that this zoning will provide for. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. These types of air emissions have been shown to increase the risk of, contribute to, and exacerbate a multitude of developmental, physical, physiological, physiological, cognitive and economic. The exposure of one individual can cause repercussions in multiple generations. Embryos, fetuses, and children are most vulnerable with effects born out over a lifetime, and that of their offspring. Many of these effects only require short-term exposure and some have even been shown to occur at levels below current limits recommended by the World Health Organization. One example of this is that a recent study found that “Even within the limits set by the World Health Organization, the pollutants PM10, SO₂, NO₂, and O₃ are associated with increased risk of treatment for respiratory diseases in children 0 to 6 years of age.” Unfortunately, the US limits are higher than WHO, 300 % higher in the case of PM10!

In fact, in 2019, in the Advice from the Independent Particulate Matter Review Panel (formerly U.S. EPA Clean Air Scientific Advisory Committee Particulate Matter Review Panel) on EPA’s Policy Assessment for the Review of the National Ambient Air Quality Standards for Particulate Matter, it stated that the committee unanimously and unequivocally found that the current primary annual and 24-hour PM_{2.5} National Ambient Air Quality Standards (NAAQS) are not adequate to protect public health. The advice from this 20-member committee, whose scientific disciplines include epidemiology, medicine, toxicology, air quality measurement, air quality modeling, exposure assessment measurement and modeling, risk assessment, statistics, and others, was ignored due presumably to political pressure. Not only are the NAAQS too high in some cases, but due to the measure and mechanism by which they work, they can not replace the safety provided by good land use and zoning regulations, that are meant to do things like keep factories with air emissions and hundreds of heavy trucks away from elementary schools. In fact, there is a state law that prohibits siting a school near a factory. Unfortunately, the reciprocal law does not exist. Clearly, just like with the water resources, we cannot rely on the DEP or the EPA to do the job of what appropriate zoning should do. The whole point of zoning is to keep people safe and provide for their health and welfare. Ordinance #2017-302 puts families and school children directly in harms way.

The air emissions, threat to the groundwater, and the very presence of the industry that this zoning change will allow for will have a serious negative economic effect on those who live and or work closest to the site in question. Productivity and workforce participation will be negatively affected by the health effects of the air emissions. The local agricultural operations will be negatively affected by the air emissions with lower quantity and quality of crop yield and would be devastated if the ground water aquifer were fouled. The equine operations in the area, of which there are several, will be negatively affected by the air emissions as they affect the horses’ health and performance. The mere presence of the industry that will be provided

for by this zoning change will cause property values to fall. There will be serious economic consequences for the immediate area around the site in question.

Several of the communities in the immediate area of the site for proposed zoning change are traditionally underserved and have lower economic status. The choice of this location for such a zoning change represents an egregious example of environmental injustice that should not be promulgated or tolerated.

This zoning change will provide for industry that will negatively affect the health safety and welfare of our community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Susan Mellott

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

We the people, the citizens of this Appalachian region we call home, **STRONGLY OPPOSE HEAVY INDUSTRY** in our back yards. We insist you **NOT** to rezone the former apple orchard for heavy industry. We **DO NOT WANT** pollution, smoke stacks, increased traffic, and our tax monies used to promote profits for a foreign entity at the expense of our health, scenery, and pockets. Heavy industry causes multiple types of pollution: air, ground, water, light, noise, traffic, etc. Even with regulations and safety standards in place, rules can still be broken and accidents still can happen. **PLEASE** do not take this gamble with our lives and livelihood. Our future is in your hands. Do not fall victim to peer pressure, profits, and greed... and instead look into your heart and do what is right here. Place yourself in our shoes... **WOULD YOU WANT THIS IN YOUR BACK YARD?** If you answered no to that, then you need to say **NO TO RE-ZONING FOR HEAVY INDUSTRY.**

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants.

These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that will significantly harm the municipalities within Jefferson County and beyond effecting the health, welfare, and safety of our community. Harpers Ferry is a national treasure with the natural and historic resources tours flock to see each year and one of the communities that will be negatively impacted by this zoning change.

According to a 2019 study by the West Virginia Tourism Office, Jefferson County generated an average of \$178 million per year in tourism-derived revenue for state and local governments over the last 10 years, more than any other county in West Virginia by at least double. Tourism benefits the businesses and economy of Ranson and Jefferson County producing \$213.7 million in individual earning, 7040 jobs, and \$842.6 million in direct spending here in 2018. We would need 40 Project Shuttles to replace the individual earnings and 59 Rockwools to replace the jobs provided by the tourism industry in Jefferson County. It is important to note that most of the money generated by tourism in Jefferson County comes from neighboring states. In this way, it is like an export: not simply recycling money, but bringing money into the state increasing its wealth. Much of the economy in Harpers Ferry is based on this tourism industry. A threat to this industry poses a threat to the economy and welfare of our community.

One of the important drivers for tourism in Harpers Ferry is the Appalachian Trail. According to the Appalachian Trail Conservancy (ATC), Harpers Ferry is the psychologic midpoint of the Trail, and hikers often plan extended stays in Jefferson County with an obvious positive impact. The ATC reports that the smokestacks and associated lights will be visible in the viewshed of 15 vistas on the Appalachian Trail (AT). Studies have shown that quality of vistas and human impact on the environment are not only noticed by visitors, but effect their experience. Another study published in the Journal of Applied Recreation Research, found that points of interests and views drew visitors' attention and had a significant impact on their perception of the trail. It was also found that particularly beautiful vistas helped visitors overlook elements

that usually have a negative effect on trail experience like increased trail traffic. A 2009 study in Leisure Sciences revealed that scenic value was a perceptual theme of Appalachian Trail visitors, and that things as simple as dead trees visible in a vista can have a negative impact on visitors' overall perception. Imagine the effect the smokestacks will have from the 15 vistas from which they will be visible. The introduction of industrial activity made possible by the proposed rezoning in Ranson would have a negative effect on the scenic views of beautiful landscapes from the Appalachian Trail in Jefferson County.

The smokestacks are not all visitors will be able to see — the air pollution will create haze. The effect of regional haze on tourists was explored in a review article published in the Atmospheric Environment titled "Impaired visibility: the air pollution people see." A key takeaway on the negative affect of haze on vacationing tourists was summarized as follows:

"Vacations offer an escape from the routine and stress of our daily lives. Vacation destinations are often chosen based on their scenery; vacations are spent gazing at monuments, mountains, clouds, and oceans. Good visibility allows clear observation of distant features and appreciation of the inherent beauty of these scenes...Air pollution, which is often present in both our cities and parks, interferes with these attributes and can ruin the views vacationers travel to enjoy."

People seek bucolic, unspoiled areas to escape the stresses of urban areas. A 2004 study in Environment and Behavior found perceived pollution causes stress while viewing natural scenes has both psychological and physiological benefits, and a 2007 study confirmed these benefits. Two other studies found that people are emotionally affected by poor visibility, and tourists are disappointed when views are obscured by haze.

The combination of smokestacks and haze will mar the viewshed and will not only reduce the positive effects of a scenic landscape but also leave tourists disappointed and dissatisfied with their choice of destination. With these effects the welfare of the Harpers Ferry community would undoubtedly be endangered by the industry that this zoning change will provide for.

Multiple studies by doctors Kozar, Doctor, and Doctor have demonstrated that the land at this site to be rezoned is Karst with the highest likelihood of sinkhole development in the county, and that the groundwater aquifer there is incredibly sensitive to contamination from surface water. Further, this site is on an upland plain with relatively few surface streams, seasonal variability in the water table that results in numerous estavelles, and large amounts of water in the epikarst. In this area contamination in surface water communicates easily to the water in the epikarst via diffuse and point infiltration, and the springs at the margins of the upland area are directly affected by the water quality throughout the aquifer. According to Jefferson Orchards Voluntary Remediation Plan with the WVDEP, the groundwater at the site is approximately 60 feet below the ground, and the tests performed by the USGS have shown that groundwater from just adjacent to this site emerged in the headwaters of both the Elk's Run and Rattlesnake Run. This is critically important for Harpers Ferry because the Elk's Run headwaters is a spring about three miles southeast of the site and goes on to become the drinking water source for Harpers Ferry and Bolivar before emptying into the Potomac River.

The headwaters of Rattlesnake Run is a spring about 3.5 miles from the site and is also a tributary of the Potomac River. The Potomac River is the back up water source for Harpers Ferry. This means that the activity at the site will have a critical influence on the drinking water of Harpers Ferry. In this was the industry permitted by this change in zoning would undoubtedly endanger the health and safety of the community in Harpers Ferry.

The untoward health effects and individual economic consequences from the pollution emissions of the industry this rezoning will allow that will be born out over the length of people's lives and that of their decedents for at least three generations is an egregious example of environmental injustice that should not be tolerated. This zoning change may be in one of the poorest sections of the county, but the effects will be felt in every part of Ranson and the county.

The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." The industry that this rezoning will allow will jeopardize the health, safety and welfare of Ranson, Harpers Ferry and the whole county. Please vote no on the ordinance #2017-302.

Rockwool is NOT in the best interest of the people OR the economy of Jefferson County. It is a bad deal. Vote NO.

Sincerely,

Mark Johnson

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that will significantly harm the municipalities within Jefferson County and beyond effecting the health, welfare, and safety of our community. Harpers Ferry is a national treasure with the natural and historic resources tours flock to see each year and one of the communities that will be negatively impacted by this zoning change.

According to a 2019 study by the West Virginia Tourism Office, Jefferson County generated and average of \$178 million per year in tourism-derived revenue for state and local governments over the last 10 years, more than any other county in West Virginia by at least double. Tourism benefits the businesses and economy of Ranson and Jefferson County producing \$213.7 million in individual earning, 7040 jobs, and \$842.6 million in direct spending here in 2018. We would need 40 Project Shuttles to replace the individual earnings and 59 Rockwools to replace the jobs provided by the tourism industry in Jefferson County. It is important to note that most of the money generated by tourism in Jefferson County comes from neighboring states. In this way it is like an export. Not simply recycling money but bringing money into the state increasing its wealth. Much of the economy in Harpers Ferry is based on this tourism industry. A threat to this industry poses a threat to the economy and welfare of our community.

One of the important drivers for tourism in Harpers Ferry is the Appalachian Trail. According to the Appalachian Trail Conservancy (ATC), Harpers Ferry is the psychologic midpoint of the Trail, and Hikers often plan extended stays in Jefferson County with an obvious positive impact. Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

My wife and I chose this location for its friendly community, charming shops, and economic growth potential. I understand the impetus to bring new industry to the area...job creation is a keystone of a healthy community. However, heavy industry is the wrong direction. It's economically short sighted, environmentally hazardous, and spoils the natural beauty of the area. These are unique and valuable resources, and endangering them for quick factory jobs would be a misstep. We would be better served further investing in education (particularly distance education), Information Technology, and creative sectors. This is already a "bedroom community" for many of us in the tech sectors who were priced out of NoVA and DC. That's a huge potential pool of intellectual capital that could be leveraged for an economic renaissance without the noise, pollution, traffic, and environmental damage associated with heavy industry such as Rockwool.

It is my hope that the leadership of Jefferson County has the future and the best interest of its constituents in mind.

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City.

Sincerely,

Jared Drewniak

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The city has failed to address the latter part of this objective. By Changing the SDI in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and child hood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health, and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and overall earnings for owners, breeders, and

trainers. This group provides over 70 million dollars in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. This industry would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitorship and again decreasing return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up this industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the Karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive plan is clear the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Kimberly Fognano

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on #2017-302. The air emissions, possibility of ground and surface water contamination, and their effect on our interwoven economies threaten the health, safety and welfare of not just Jefferson County but the greater region, including Loudoun and the greater Northern Virginia area.

This zoning would provide for industry that produces large amounts of air emissions. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. Northern Virginia is directly downwind from these emissions. Much of the gaseous, fine particulate, and hazardous emissions can reach Northern Virginia. Further affecting the outdoor air quality of the adjacent portion of Virginia and the ability of these areas to achieve and maintain National Ambient Air Quality Standards (NAAQS) attainment. This will affect agriculture and outdoor leisure and recreation.

For example, Loudoun County has been in nonattainment for the NAAQS 8-hour Ozone standard for the past two years. VOC and NO_x react after they have been emitted to produce ground level ozone. The industry that this rezoning would provide for would produce large amounts of these emissions. This would make it even harder as Loudoun County tries to achieve attainment. As time goes on and the scientific research advances our knowledge and understanding of the extent to which gaseous, particulate and hazardous emissions affect human health the NAAQS standards are likely to be reduced. The effects on air emission from this rezoning will make it only harder for Loudoun and Northern Virginia to meet these standards.

In addition to the concerns about the air, the possible ground and surface water contamination is very concerning to Loudoun and Virginia residents. The site is known to have ground water that is vulnerable to contamination due to the karst hydrogeology. A USGS study demonstrated that the ground water adjacent to the site to be rezoned communicates readily with surface

water tributaries of the Potomac River. In addition to direct infiltration where water moves directly from the surface to groundwater via porous limestone bedrock, karst is known to have severe ground instability problems. This makes karst geology prone to sinkhole development. Sinkholes provide direct connection between the surface water and any contaminants it may contain and the groundwater. This makes the aquifer vulnerability in karst areas very high, and contamination with industrial activity such as that provided for by this rezoning too likely.

Loudoun sources its drinking water from the Potomac River, downstream of many West Virginia tributaries that carry water from the epikarst and groundwater aquifer at the site to be rezoned. Loudoun has recently completed the new Trap Rock Water Treatment facility, which draws water from the Potomac River. Loudoun currently provides 40 million gallons and projects to provide 90 million gallons of drinking water a day to customers by 2040 (Loudounwater.org). Therefore, the viability of the Potomac River is a high priority for Virginia residents.

Loudoun and Northern Virginia is one of the fastest growing communities in the country and provides a lot to Jefferson County in their symbiotic relationship. Virginia residents support and enjoy Jefferson County through tourism, as our residents enjoy the natural and historical resources of your county. Virginia residents and businesses support the equine industry in a multitude of ways from providing wagering fans at the races to the Virginia Breeders Association Virginia Certified incentive programs and a strong market for retired racehorses. According to an economic impact study from WVU, at least 40% of Jefferson County residents travel outside of West Virginia for work, a good percentage of those travel to northern Virginia. This rezoning would allow for industry that would negatively affect the economy of both places and this relationship and the benefits for our residents gleaned from it.

This zoning change will provide for industry that will negatively effect the health safety and welfare of the Loudon and Northern Virginia community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Miles Harrison

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The city has failed to address the latter part of this objective. By Changing the SDI in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and child hood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health, and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and overall earnings for owners, breeders, and

trainers. This group provides over 70 million dollars in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. This industry would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitorship and again decreasing return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up this industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the Karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive plan is clear the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

I vote no on this ordinance, #2017-302.

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would negatively affect tourism, economic agility, groundwater quality, and individual health in neighboring municipalities like Shepherdstown.

Tourism is critically important to Shepherdstown's economy and to the county as a whole. In 2018, tourist spending in the Jefferson County contributed over \$170 million to state and local government revenue and \$213 million in individual earnings. Importantly, most of this money comes from tourists visiting from neighboring states like Virginia, Maryland, and Washington D.C. Out-of-state tourists are largely drawn to Jefferson County because of its reputation for environmental-friendly, sustainable industry. Key elements that support this reputation include the county's pastoral scenery and pristine natural resources. Ordinance #2017-302 will allow industry into Jefferson County that risks harming these elements and dramatically reducing the area's appeal to visitors. The resulting harm to our tourist industry would drive away visitors and decrease state, county, and local revenue. The long-term success of Jefferson County's tourism industry is dependent on local governments making coordinated zoning decisions. Allowing certain types in industry in Ranson will negatively affect tourism in every municipality throughout the county, including Shepherdstown. Voting no on ordinance #2017-302 will protect the foundations of the county's tourism industry and protect the 7,040 jobs in Jefferson County that are directly supported by tourism.

The type of large, consolidated industry that ordinance #2017-302 would allow in Ranson would generally reduce the flexibility of local economies in Jefferson County. Historically, the driving industries in Jefferson County have been tourism, agriculture, and the equine industries. These three industries are large conglomerates of small businesses. Small business is very important to Sheherdstown. Small businesses have been shown to create more jobs, cultivate more innovation, and provide more opportunities than big, non-local firms. Additionally, small businesses have been shown to more reactive to sudden changes relative to manufacturing

businesses. Bringing large, manufacturing-based industry into Jefferson county will depress the local economy and stifle innovation. During this time of economic upheaval and uncertainty, Jefferson County needs to support industries that will allow local economies to adapt and recover as fast as possible.

Voting no on ordinance #2017-302 will help protect water resources throughout Jefferson County. The type of industry that ordinance #2017-302 would allow puts the ground resources of Jefferson county at significant risk due to the karst hydrogeology. The site in Ranson is in the Rocky Marsh Run watershed, which is in the source water protection zone for Shepherdstown and drains to the Potomac River. Therefore, activity at this site will affect both groundwater and surface water streams. In municipalities like Shepherdstown, many residents and nearby farms depend on wells for water. Contamination of groundwater aquifers would create both health and remediation concerns for local residents. Dye tests performed by the USGS near the area of proposed rezoning in Ranson have shown just how far-reaching groundwater contamination at the Ranson site could be. Results from the USGS study revealed measurable dye concentrations in Elk's Run, Rattlesnake Run, and even the Shepherdstown Town Run. This last run cuts through the center of Shepherdstown and is a favorite area for children to play and learn to fish.

Groundwater pollution is not the only concern for communities like Shepherdstown. The type of industry that ordinance #2017-302 would allow in Ranson would also generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. These pollutants are particularly harmful to children. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. The site in Ranson is across the road from an elementary school and also within the Jefferson High Middle district. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of children in Shepherdstown and all of Jefferson County.

I again request that you vote no on ordinance #2017-302. The long-term economic, environmental, and community health of municipalities like Shepherdstown depend on Ranson's participation in a coordinated zoning plan for all of Jefferson County.

Sincerely,

Laurie Robinson
Shepherdstown, 25443

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on #2017-302. The air emissions, possibility of ground and surface water contamination, and their effect on our interwoven economies threaten the health, safety and welfare of not just Jefferson County but the greater region, including Loudoun and the greater Northern Virginia area.

This zoning would provide for industry that produces large amounts of air emissions. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. Northern Virginia is directly downwind from these emissions. Much of the gaseous, fine particulate, and hazardous emissions can reach Northern Virginia. Further affecting the outdoor air quality of the adjacent portion of Virginia and the ability of these areas to achieve and maintain National Ambient Air Quality Standards (NAAQS) attainment. This will affect agriculture and outdoor leisure and recreation.

For example, Loudoun County has been in nonattainment for the NAAQS 8-hour Ozone standard for the past two years. VOC and NO_x react after they have been emitted to produce ground level ozone. The industry that this rezoning would provide for would produce large amounts of these emissions. This would make it even harder as Loudoun County tries to achieve attainment. As time goes on and the scientific research advances our knowledge and understanding of the extent to which gaseous, particulate and hazardous emissions affect human health the NAAQS standards are likely to be reduced. The effects on air emission from this rezoning will make it only harder for Loudoun and Northern Virginia to meet these standards.

In addition to the concerns about the air, the possible ground and surface water contamination is very concerning to Loudoun and Virginia residents. The site is known to have ground water that is vulnerable to contamination due to the karst hydrogeology. A USGS study demonstrated that the ground water adjacent to the site to be rezoned communicates readily with surface

water tributaries of the Potomac River. In addition to direct infiltration where water moves directly from the surface to groundwater via porous limestone bedrock, karst is known to have severe ground instability problems. This makes karst geology prone to sinkhole development. Sinkholes provide direct connection between the surface water and any contaminants it may contain and the groundwater. This makes the aquifer vulnerability in karst areas very high, and contamination with industrial activity such as that provided for by this rezoning too likely.

Loudoun sources its drinking water from the Potomac River, downstream of many West Virginia tributaries that carry water from the epikarst and groundwater aquifer at the site to be rezoned. Loudoun has recently completed the new Trap Rock Water Treatment facility, which draws water from the Potomac River. Loudoun currently provides 40 million gallons and projects to provide 90 million gallons of drinking water a day to customers by 2040 (Loudounwater.org). Therefore, the viability of the Potomac River is a high priority for Virginia residents.

Loudoun and Northern Virginia is one of the fastest growing communities in the country and provides a lot to Jefferson County in their symbiotic relationship. Virginia residents support and enjoy Jefferson County through tourism, as our residents enjoy the natural and historical resources of your county. Virginia residents and businesses support the equine industry in a multitude of ways from providing wagering fans at the races to the Virginia Breeders Association Virginia Certified incentive programs and a strong market for retired racehorses. According to an economic impact study from WVU, at least 40% of Jefferson County residents travel outside of West Virginia for work, a good percentage of those travel to northern Virginia. This rezoning would allow for industry that would negatively affect the economy of both places and this relationship and the benefits for our residents gleaned from it.

This zoning change will provide for industry that will negatively effect the health safety and welfare of the Loudon and Northern Virginia community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Josh
Sterling, 20165

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask you to vote NO on Ordinance #2017-302. The industry this zoning change will allow for endangers the health, safety and, welfare of the community, and violates the premise of the smart code zoning that we have spent so much time, effort and federal money employing.

Any change in zoning needs to align with the comprehensive plan. In Ranson's current comprehensive plan (2012), the City only refers to "heavy industry" in the history section. Here it is characterized as part of a bygone era that has been replaced by an emphasis on agriculture for local food production, open spaces, and quality-of-life. In the remainder of the document, the word industry is used loosely to describe businesses including flower shops and shoe stores. Nothing that resembles the industry that this zoning change will provide for is described in the current comprehensive plan of Ranson.

In the land use section of the comprehensive plan, number ten states:

"Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The comprehensive plan clearly states that the city will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community. This change in zoning clearly negatively affects the health, safety, and welfare of the community.

As the zoning is proposed, the industry that this zoning change will allow for will be directly across the street from houses, parks and other small businesses. A densely populated subdivision and an elementary school already exit directly across the street. While these latter

community sections are not in the city limits, the effect of this zoning on them should still be considered just the same as it would be if they were in the city limits.

The industry that this zoning change will provide for will produce particulate, gaseous, and hazardous air emissions. These emissions have been shown to be detrimental to human health at every stage of life from embryo to old age. In utero and childhood exposure are the most damaging with lasting effects being realized through out life, and with maternal exposure the effects can be felt for generations. Multiple organ systems are affected including respiratory, cardiovascular, neurologic, immune, and endocrine causing defects in multiple processes including in utero development, neurodevelopment, immune and tolerance development, and cognitive defects. There are also psychological, social, and economic effects from both perceived and actual air pollution in both children and adults. Many of these effects can be seen even with short-term exposure or exposure that is lower than the levels recommended by the US Environmental Protection Agency and World Health Organization. These consequences are devastating to the individual and depressing to the local community and economy. State law does not allow a school to be built next to industry that this zoning will allow but yet we are contemplating changing the zoning so this industry can build next to a school. This does not make sense. As Ranson residents, we want Ranson to follow the lead of the state and keep polluting industry away from kids. In these ways, this change in zoning will negatively affect the health and welfare of the community.

In addition to the health effects of the air emissions is the threat to groundwater from the industry that this zoning change would allow. The land in question has karst hydrogeology and therefore very high aquifer vulnerability and is not appropriate for this industry. With the type of industry this zoning will provide for, combined with high aquifer vulnerability, the likelihood of groundwater contamination is too high for the community and region to bear. A USGS study demonstrated that contamination in the groundwater adjacent to the site moves relatively quickly and can be found in wells and surface water structures in a variety of locations in the County. In this way, contamination at the site would affect the drinking water of the great majority of Jefferson County residents. Through the surface water connections, the water at the site also affects the water resources of the region.

Aquifer vulnerability has been used by policy makers for decades to set land use regulations. The guiding document, from the WVDEP, *Stormwater Management Design in Karst Areas* states, "it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." In Ranson, we need to follow this advice and not change the zoning of this land for use by industry that has among the highest aquifer vulnerability in the County. This zoning change will endanger the safety of the community and region by endangering the safe water resources. As Ranson residents, we want to safeguard the water resources of the county and region by following the WVDEP guidance here.

Further, by reallocating this transect district and replacing it with a monolithic block of Special District Industrial designation, hundreds of housing units, parks and space for small businesses are lost. Ranson loses the potential for property tax on these properties and their improvements, Business and Occupational tax on the businesses and sales tax in retail stores. The community loses out on the opportunity to develop affordable housing and create locations where people can live, work, play, and shop all in the same place reducing the need for travel.

Worse yet apparently a deal has been made where the entity that owns the subject land has required that a litany of things not be built on the adjacent land essentially stripping the purpose of the smart code transect zone that exists there. Transect zones in the smart code are meant to transition, from out to in, and provide communities where people can safely work and live in close proximity in an effort to reduce travel. Excluding many of the components of the transect zone effectively eliminates the features that make it a transect zone, thus, losing the benefits a transect zone offers the community and city. By losing these benefits, reducing the overall and affordable housing prospects, and reducing so drastically the opportunities for city income, this zoning change will negatively affect the welfare of the community.

As Ranson residents, we find it odd that we are changing zoning to provide for industry that we would not put in the middle of our town close to our residents, but we are placing it close to the homes of county residents. Further, it is striking that the area where this change in zoning is directly adjacent to historically underserved lower income communities and a Title I school. This amounts to environmental injustice and cannot be tolerated.

The purpose of zoning is for a city to protect the health, welfare, morals and safety of the community. In this case, the air emissions and heavy truck traffic will endanger the communities' health. The threat of water contamination will endanger the safety of the community. The effect of lost productivity and decreased workforce participation due to increased illness and the negative effect the air emissions and presence of such a factory will have on the local economy will negatively affect the welfare of the community. The environmental injustice of changing the zoning to accommodate such polluting industry in a location where your municipality has no residents, but yet hundreds of low income and underserved county residents live is egregiously amoral. This must not happen. We respectfully implore you to do the right thing and vote no on ordinance #2017-302.

Sincerely,

Jesus Soriano Molla

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would negatively affect tourism, economic agility, groundwater quality, and individual health in neighboring municipalities like Shepherdstown.

Tourism is critically important to Shepherdstown's economy and to the county as a whole. In 2018, tourist spending in the Jefferson County contributed over \$170 million to state and local government revenue and \$213 million in individual earnings. Importantly, most of this money comes from tourists visiting from neighboring states like Virginia, Maryland, and Washington D.C. Out-of-state tourists are largely drawn to Jefferson County because of its reputation for environmental-friendly, sustainable industry. Key elements that support this reputation include the county's pastoral scenery and pristine natural resources. Ordinance #2017-302 will allow industry into Jefferson County that risks harming these elements and dramatically reducing the area's appeal to visitors. The resulting harm to our tourist industry would drive away visitors and decrease state, county, and local revenue. The long-term success of Jefferson County's tourism industry is dependent on local governments making coordinated zoning decisions. Allowing certain types in industry in Ranson will negatively affect tourism in every municipality throughout the county, including Shepherdstown. Voting no on ordinance #2017-302 will protect the foundations of the county's tourism industry and protect the 7,040 jobs in Jefferson County that are directly supported by tourism.

The type of large, consolidated industry that ordinance #2017-302 would allow in Ranson would generally reduce the flexibility of local economies in Jefferson County. Historically, the driving industries in Jefferson County have been tourism, agriculture, and the equine industries. These three industries are large conglomerates of small businesses. Small business is very important to Sheherdstown. Small businesses have been shown to create more jobs, cultivate more innovation, and provide more opportunities than big, non-local firms. Additionally, small businesses have been shown to more reactive to sudden changes relative to manufacturing

businesses. Bringing large, manufacturing-based industry into Jefferson county will depress the local economy and stifle innovation. During this time of economic upheaval and uncertainty, Jefferson County needs to support industries that will allow local economies to adapt and recover as fast as possible.

Voting no on ordinance #2017-302 will help protect water resources throughout Jefferson County. The type of industry that ordinance #2017-302 would allow puts the ground resources of Jefferson county at significant risk due to the karst hydrogeology. The site in Ranson is in the Rocky Marsh Run watershed, which is in the source water protection zone for Shepherdstown and drains to the Potomac River. Therefore, activity at this site will affect both groundwater and surface water streams. In municipalities like Shepherdstown, many residents and nearby farms depend on wells for water. Contamination of groundwater aquifers would create both health and remediation concerns for local residents. Dye tests performed by the USGS near the area of proposed rezoning in Ranson have shown just how far-reaching groundwater contamination at the Ranson site could be. Results from the USGS study revealed measurable dye concentrations in Elk's Run, Rattlesnake Run, and even the Shepherdstown Town Run. This last run cuts through the center of Shepherdstown and is a favorite area for children to play and learn to fish.

Groundwater pollution is not the only concern for communities like Shepherdstown. The type of industry that ordinance #2017-302 would allow in Ranson would also generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. These pollutants are particularly harmful to children. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. The site in Ranson is across the road from an elementary school and also within the Jefferson High Middle district. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of children in Shepherdstown and all of Jefferson County.

I again request that you vote no on ordinance #2017-302. The long-term economic, environmental, and community health of municipalities like Shepherdstown depend on Ranson's participation in a coordinated zoning plan for all of Jefferson County.

Sincerely,

Stephanie Hayhurst
Martinsburg, 25404

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

This zoning change will provide for industry that will negatively affect the agriculture industry in Jefferson County and beyond. The combination of the air emissions and threat to the ground water resources could have devastating consequences for the agricultural community of Jefferson County.

The agriculture industry in Jefferson County is hundreds of years old and continues to serve our community well today. According to the economic impact study "A Shared Agenda for Growing West Virginia's Agricultural Economy, Prepared by Fourth Economy for West Virginia Department Of Agriculture West Virginia University Extension Service 2012," Jefferson County is the second highest producing county for crops sales, third highest for fruits and vegetables sales, and in the top 9 counties for sales of animals and animal products.

Agriculture, tourism and the equine industries work synergistically to have an outsized positive impact on the economy in Ranson and Jefferson County as a whole. Agriculture drives tourism by creating agro-tourism opportunities, preserving beautiful open spaces that contribute to the bucolic nature of our county, and providing the locally produced agriculture goods many tourists are look for in our markets and restaurants. Agriculture also supports the equine industry by providing local products like hay and straw, helping maintain pasture land, co-supporting local dual-purpose retail stores, and helping recycle by products. Agriculture helps maintain the way of life that many those who choose to live in Jefferson County enjoy. Industrial manufacturing and industry this zoning will provide for could never achieve these things.

Local agriculture also provides a source of locally produced agricultural goods. It has become apparent with the current pandemic and health emergency. This became a supply chain crisis because as our supply chains have moved to be ever more lean and efficient they lack resiliency and agility. By having a local source of agricultural goods and food we add resiliency and agility

into our own economy and community. The agricultural industry in Jefferson County provides this.

A plethora of scientific studies have shown that a variety of air pollutants produced by the type of industry this zoning change would provide for causes decreased yields of both quantity and quality for several of the crops important to Jefferson County including winter wheat and soybeans. Soybeans and wheat are two of the crops significantly affected and two of the most prevalent crops in Jefferson County. Lower crop yields harm the farms and all the members of the down stream supply chain as well as the consumer.

Recent studies have shown that even small increases in air pollution affect the productivity of agricultural workers. Similar to the reduction in crop yield this will negatively affect the individual workers, businesses, consumers and industry as a whole.

Even more devastating is the possibility of groundwater contamination. The land at the subject location has karst hydrogeology and as such has porous bedrock and severe ground instability problems. The porous bedrock allows rapid diffuse infiltration of surface water into ground water and the severe ground instability problems leads to sinkhole development. Sinkholes provide direct connection of the surface water with the ground water aquifer through point infiltration. In fact, according to a 2012 study by Doctor and Doctor, the subject location and that of Terrapins Neck have the highest sinkhole vulnerability of any sites in Jefferson County. The propensity and easy of diffuse and point infiltration in areas of karst hydrogeology give them very high aquifer vulnerability meaning the aquifer is very vulnerable to contamination. For this reason, this measure has been used for decades by policymakers to set land use regulations.

The WVDEP recognizes development in car karst areas puts water resources high-risk for contamination but also recognizes that this is best protected against true local land use and zoning ordinances. WVDEP's guiding document *Stormwater Management Design in Karst Areas* states, "it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." This document also references the Chesapeake Bay Stormwater Network karst stormwater guidance document the *CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed*. In which it states "...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." Land use policy in Ranson and zoning need to take aquifer vulnerability into consideration as these agencies and documents suggest.

The Jefferson Orchards Voluntary Remediation Plan application reports that the ground water is only 60 feet from the surface at the site. It is described in the scientific literature that this land is an upland plane with large amounts of water in the epikarst, and contamination of this

water effects the whole aquifer including the communications with surface water streams. A USGS study demonstrated that the groundwater adjacent to the site communicates readily with several surface water structures and wells miles away from the site. The effects of contamination at this site would go well beyond Ranson fouling large portions of the ground water and surface water in Jefferson County.

Groundwater contamination at the site would have devastating effects on the Agricultural industry in Jefferson county. For geographic and economic reasons it is simply infeasible for the agricultural industry to rely on utility provided water. Based on the scientific literature the site being considered for rezoning is one of the areas of highest aquifer vulnerability in Jefferson County and is inappropriate for the industry that this zoning change will provide for.

By threatening the local agricultural industry, the industry that this zoning will provide for will threaten the health, safety, and welfare of the community. The Comprehensive Plan in Ranson is clear the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Paul Hester

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would have a negative effect on water and air quality in neighboring states such as Maryland.

The Potomac River provides drinking water and a source of recreation to Maryland residents. Water and air pollution generated within the Potomac River's watershed will inevitably contaminate this valuable waterway. The site of the proposed zoning change in Ranson is located within the Potomac River Watershed.

The type of industry that ordinance #2017-30 would allow in Ranson would generate large quantities of wastewater, stored on-site, in an area of known karst terrain. The West Virginia Department of Environmental Protection has published guidelines that specifically discourage extensive development in areas of karst terrain because of the vulnerability of karst aquifers to contamination by surface pollution. Karst features increase surface water and groundwater connectivity and any spills or surface releases quickly percolate into the groundwater. Additionally, sinkholes are common in karst terrain and can cause ruptures in wastewater impoundments. Even if appropriate attempts are made to contain and manage wastewater and other stormwater runoff on-site, there is still a high risk that wastewater could contaminate the groundwater through tears and catastrophic failure of wastewater impoundments. Contaminated groundwater in karst terrain can easily resurface in waterways several miles away, as shown by a USGS tracer study conducted near the site in Ranson. The USGS study detected tracer dye in multiple springs and waterways miles from the initial injection site in Ranson. All of these waterways drain into the Potomac River.

Mismanagement of wastewater could also lead to contamination of nearby surface waters. For example, the site of the proposed rezoning in Ranson is in the Rocky Marsh Run watershed. Rocky Marsh Run also drains to the Potomac River. Voting no on ordinance #2017-30 will

preserve downstream water quality and ensure that the Potomac River remains usable for Maryland residents.

Air pollution poses another risk to Maryland residents. The type of industry that ordinance #2017-302 would allow would generate air pollutants like fine particulate matter. According to the US EPA, fine particulates can travel 100s of miles from its original source. Air pollution related to industrial activity in Ranson could easily reach Maryland. Fine particulates have a greater affinity for carrying toxic compounds and their small size allows them to be inhaled more deeply into the lungs. Chronic exposure to fine particulate matter is associated with increased risk of Alzheimer's in adults. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. Fine particulate matter also exacerbates regional haze which creates a visible reminder of air pollution. The psychological effects that arise from an increased perception of pollution include stress, anxiety, and unhappiness. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of Maryland residents.

I again request that you vote no on ordinance #2017-302. Zoning decisions in Ranson and Jefferson County have an undeniable influence on the quality of life in neighboring states.

Sincerely,

Charles Page

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on #2017-302. The air emissions, possibility of ground and surface water contamination, and their effect on our interwoven economies threaten the health, safety and welfare of not just Jefferson County but the greater region, including Loudoun and the greater Northern Virginia area.

This zoning would provide for industry that produces large amounts of air emissions. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. Northern Virginia is directly downwind from these emissions. Much of the gaseous, fine particulate, and hazardous emissions can reach Northern Virginia. Further affecting the outdoor air quality of the adjacent portion of Virginia and the ability of these areas to achieve and maintain National Ambient Air Quality Standards (NAAQS) attainment. This will affect agriculture and outdoor leisure and recreation.

For example, Loudoun County has been in nonattainment for the NAAQS 8-hour Ozone standard for the past two years. VOC and NO_x react after they have been emitted to produce ground level ozone. The industry that this rezoning would provide for would produce large amounts of these emissions. This would make it even harder as Loudoun County tries to achieve attainment. As time goes on and the scientific research advances our knowledge and understanding of the extent to which gaseous, particulate and hazardous emissions affect human health the NAAQS standards are likely to be reduced. The effects on air emission from this rezoning will make it only harder for Loudoun and Northern Virginia to meet these standards.

In addition to the concerns about the air, the possible ground and surface water contamination is very concerning to Loudoun and Virginia residents. The site is known to have ground water that is vulnerable to contamination due to the karst hydrogeology. A USGS study demonstrated that the ground water adjacent to the site to be rezoned communicates readily with surface

water tributaries of the Potomac River. In addition to direct infiltration where water moves directly from the surface to groundwater via porous limestone bedrock, karst is known to have severe ground instability problems. This makes karst geology prone to sinkhole development. Sinkholes provide direct connection between the surface water and any contaminants it may contain and the groundwater. This makes the aquifer vulnerability in karst areas very high, and contamination with industrial activity such as that provided for by this rezoning too likely.

Loudoun sources its drinking water from the Potomac River, downstream of many West Virginia tributaries that carry water from the epikarst and groundwater aquifer at the site to be rezoned. Loudoun has recently completed the new Trap Rock Water Treatment facility, which draws water from the Potomac River. Loudoun currently provides 40 million gallons and projects to provide 90 million gallons of drinking water a day to customers by 2040 (Loudounwater.org). Therefore, the viability of the Potomac River is a high priority for Virginia residents.

Loudoun and Northern Virginia is one of the fastest growing communities in the country and provides a lot to Jefferson County in their symbiotic relationship. Virginia residents support and enjoy Jefferson County through tourism, as our residents enjoy the natural and historical resources of your county. Virginia residents and businesses support the equine industry in a multitude of ways from providing wagering fans at the races to the Virginia Breeders Association Virginia Certified incentive programs and a strong market for retired racehorses. According to an economic impact study from WVU, at least 40% of Jefferson County residents travel outside of West Virginia for work, a good percentage of those travel to northern Virginia. This rezoning would allow for industry that would negatively affect the economy of both places and this relationship and the benefits for our residents gleaned from it.

This zoning change will provide for industry that will negatively effect the health safety and welfare of the Loudon and Northern Virginia community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Mark Ramey

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The city has failed to address the latter part of this objective. By Changing the SDI in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and child hood as development is exquisitely sensitive during these times, but the effects are realized through out life negatively impacting a variety of lifetime parameters including physical and mental health, and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over 70 million dollars in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and over all earnings. This industry would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitorship and again decreasing return on investment, cash flow, and over all earnings for the hundreds of small businesses that make up this industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the Karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive plan is clear the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

MATHEW ZENKOWICH

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would put at risk the health and well being of children of Jefferson County.

The type of industry that ordinance #2017-302 would allow in Ranson would generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. Exposure to these pollutants has devastating effects on children's health. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. Developing fetuses whose mothers are exposed to air pollution are more likely to have impaired organ development which can lead to early cognitive deficits, neurodevelopmental defects and other physical, cognitive, and psychological deficits later in life. An association between autism and prenatal exposure to particulate matter in air pollution has been demonstrated in several studies. Many studies have shown that lower test scores in math, English, and language arts are associated with exposure to outdoor air pollution. Industrial activity allowed by ordinance #2017-302 would also increase the risk of groundwater contamination in Ranson and nearby municipalities. Children whose families rely on well water, as is the case in much of Jefferson County, may be affected by polluted water. Voting no on ordinance #2017-302 will prevent air and water pollution from negatively affecting the long-term health of children in Jefferson County and surrounding areas.

The economic and environmental harm caused by the type of industry that ordinance #2017-302 would allow would put additional stress on the parents, caretakers, and teachers of children in affected areas. The weakening and destabilizing of this support network would have negative effects on local children. Many households in Jefferson County depend on the local agriculture, tourism, and equine industries for income. If industrial activity in Ranson depresses these industries, the resulting financial strain on these households will introduce additional

stress and uncertainty into children's lives. Households living in areas affected by particulate matter and regional haze will also suffer from the psychological effects of air pollution. Individuals living in areas with increase perception of pollution show increased levels of stress, anxiety, and unhappiness. School districts affected by increased air and water pollution may have trouble recruiting and retaining teachers. Teachers have a large influence on a child's daily life and, if educator quality and tenure decreases, the quality of this influence will diminish.

The site of the proposed rezoning in Ranson is across the road from an elementary school and proximal to lower-income neighborhoods. Observations like these demonstrate how ordinance #2017-302 would disproportionately affect vulnerable and historically-disadvantaged populations. The damaging health effects of air pollution have been shown to persist for at least three generations, so allowing certain types of industry in low-income areas would only compound existing disadvantages. Voting no on ordinance #2017-302 would be a step towards acknowledging that all individuals have the right to clean air and water.

Children face increased exposure to air pollution, groundwater contamination, financial instability, and environmental discrimination if ordinance #2017-302 is passed. Please vote no on ordinance #2017-302.

Sincerely,

Kristine Mumaw

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask that you vote no on Ordinance #2017-302. While not in Ranson, the land and homes around the property that is the subject of the zoning change are closer to the property than anyone who currently lives within the city limits of Ranson. This area will be affected sooner and more harshly by the environmental issues that will develop secondary to the inappropriate siting of industry this zoning would allow.

The subject land has been well studied by Drs. Kozar, Doctor and Doctor and described in the scientific literature and USGS reports as having karst hydrology with very high aquifer vulnerability. The karst landscape is a consequence of the presence of soluble bedrock, which consists of limestone in the case of the subject land. In such landscapes water percolates through the ground and dissolves the underlying rock creating a porous network of caverns and throughways. Karst aquifers are known to be "extremely vulnerable to pollution" due to direct connection between the surface water and groundwater through both point (sinkholes) and diffuse (everywhere) infiltration. It is known from the Voluntary Remediation Plan of Jefferson Orchard that the groundwater at the subject site is only 60 feet below the ground. The subject property and much of the property around it are on an upland plain with few surface streams, but great seasonal variability in the water table resulting in numerous esteves and large amounts of water in the epikarst. This water is easily contaminated and this contamination spreads quickly throughout the aquifer. Dye tests performed near the subject site by the USGS have demonstrated this quick moving thorough dispersment in the aquifer in this area. While this contamination goes on to affect springs at the margins of the upland area continuing on in streams that service municipal water sources and the Potomac River, our concerns are far more immediate in both time and distance. Well water is the only water source available in the area of the proposed zoning change and, with the exception of Fox Glen, a majority of this water is supplied by private wells. Therefore, the groundwater aquifer fulfills a critical necessity, fulfilling all needs including human consumption, household uses, and agriculture and

maintenance of livestock and horses in the immediate area around the site. The concern is that if the aquifer becomes contaminated, then the local drinking water will be fouled.

For decades now, policy makers have been using “Aquifer Vulnerability,” to set land use and water resource protection policy. Karst has very high Aquifer Vulnerability. Therefore, this industrial use is not appropriate for this land and it should not be zoned for it. The guiding documents of the WVDEP recognize this. The introduction to the WVDEP document *Stormwater Management Design in Karst Areas* states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.”

The Chesapeake Bay Stormwater Network karst stormwater guidance document the *CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed*, which the WVDEP cites in its own guiding document *Stormwater Management Design in Karst Areas*, clearly agrees stating

“First, the effect of land development on karst terrain is complex and hard to predict, and requires professional analysis to reduce the risk of geological hazards, damage to infrastructure and groundwater contamination.”

“The working group acknowledges that past approaches to stormwater and land development in karst terrain have been inadequate to safeguard the public and the environment.”

“...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.”

We clearly need stronger comprehensive land use plans and zoning that direct new growth away from karst areas to more appropriate locations. Ordinance #2017-302 is literally the opposite of this.

Further, we cannot rely on the WVDEP to do the job that good local land use guidelines and zoning should do. For example, the *CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed* states that detention and retention ponds are not recommended on karst and categorize them as discouraged. Also, quoting WVDEP’s own karst guidance: “attenuating surface runoff will increase the rate of sinkhole formation and potential groundwater contamination.” Yet the entity currently planning to utilize this zoning change is planning employment of multiple massive retention ponds and attenuating surface runoff completely. This has already been approved by the DEP in two Construction Stormwater General Permit registrations for that company. One of detention ponds is not even regulated by the DEP as it contains process water and has no outlet. Clearly the DEP recognizes the risks but is not appropriately limiting them. Relying on the DEP to protect the public health, safety, welfare, and the environment from any entity in these karst locations is simply as the CNS bulletin said it “inadequate to safeguard the public and the environment.” We must have appropriate zoning that takes into consideration appropriate use of land with karst

hydrogeology. Ordinance #2017-302 does not do this, but instead increases the risk to the public and the environment.

A second serious concern is the air emissions from the industry that this zoning will provide for. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. These types of air emissions have been shown to increase the risk of, contribute to, and exacerbate a multitude of developmental, physical, physiological, physiological, cognitive and economic. The exposure of one individual can cause repercussions in multiple generations. Embryos, fetuses, and children are most vulnerable with effects born out over a lifetime, and that of their offspring. Many of these effects only require short-term exposure and some have even been shown to occur at levels below current limits recommended by the World Health Organization. One example of this is that a recent study found that “Even within the limits set by the World Health Organization, the pollutants PM10, SO₂, NO₂, and O₃ are associated with increased risk of treatment for respiratory diseases in children 0 to 6 years of age.” Unfortunately, the US limits are higher than WHO, 300 % higher in the case of PM10!

In fact, in 2019, in the Advice from the Independent Particulate Matter Review Panel (formerly U.S. EPA Clean Air Scientific Advisory Committee Particulate Matter Review Panel) on EPA’s Policy Assessment for the Review of the National Ambient Air Quality Standards for Particulate Matter, it stated that the committee unanimously and unequivocally found that the current primary annual and 24-hour PM_{2.5} National Ambient Air Quality Standards (NAAQS) are not adequate to protect public health. The advice from this 20-member committee, whose scientific disciplines include epidemiology, medicine, toxicology, air quality measurement, air quality modeling, exposure assessment measurement and modeling, risk assessment, statistics, and others, was ignored due presumably to political pressure. Not only are the NAAQS too high in some cases, but due to the measure and mechanism by which they work, they can not replace the safety provided by good land use and zoning regulations, that are meant to do things like keep factories with air emissions and hundreds of heavy trucks away from elementary schools. In fact, there is a state law that prohibits siting a school near a factory. Unfortunately, the reciprocal law does not exist. Clearly, just like with the water resources, we cannot rely on the DEP or the EPA to do the job of what appropriate zoning should do. The whole point of zoning is to keep people safe and provide for their health and welfare. Ordinance #2017-302 puts families and school children directly in harms way.

The air emissions, threat to the groundwater, and the very presence of the industry that this zoning change will allow for will have a serious negative economic effect on those who live and or work closest to the site in question. Productivity and workforce participation will be negatively affected by the health effects of the air emissions. The local agricultural operations will be negatively affected by the air emissions with lower quantity and quality of crop yield and would be devastated if the ground water aquifer were fouled. The equine operations in the area, of which there are several, will be negatively affected by the air emissions as they affect the horses’ health and performance. The mere presence of the industry that will be provided

for by this zoning change will cause property values to fall. There will be serious economic consequences for the immediate area around the site in question.

Several of the communities in the immediate area of the site for proposed zoning change are traditionally underserved and have lower economic status. The choice of this location for such a zoning change represents an egregious example of environmental injustice that should not be promulgated or tolerated.

This zoning change will provide for industry that will negatively affect the health safety and welfare of our community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Rachel Wilkinson

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

As a frequent visitor to Jefferson County, I would ask that you please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately

decreasing return on investment, cash flow, and over all earnings for owners, breeders, and trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

The character of the county is at stake. There is no turning back after this is done.

Sincerely,

PJ Breslin

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that will significantly harm the municipalities within Jefferson County and beyond effecting the health, welfare, and safety of our community. Harpers Ferry is a national treasure with the natural and historic resources tours flock to see each year and one of the communities that will be negatively impacted by this zoning change.

According to a 2019 study by the West Virginia Tourism Office, Jefferson County generated and average of \$178 million per year in tourism-derived revenue for state and local governments over the last 10 years, more than any other county in West Virginia by at least double. Tourism benefits the businesses and economy of Ranson and Jefferson County producing \$213.7 million in individual earning, 7040 jobs, and \$842.6 million in direct spending here in 2018. We would need 40 Project Shuttles to replace the individual earnings and 59 Rockwools to replace the jobs provided by the tourism industry in Jefferson County. It is important to note that most of the money generated by tourism in Jefferson County comes from neighboring states. In this way it is like an export. Not simply recycling money but bringing money into the state increasing its wealth. Much of the economy in Harpers Ferry is based on this tourism industry. A threat to this industry poses a threat to the economy and welfare of our community.

One of the important drivers for tourism in Harpers Ferry is the Appalachian Trail. According to the Appalachian Trail Conservancy (ATC), Harpers Ferry is the psychologic midpoint of the Trail, and Hikers often plan extended stays in Jefferson County with an obvious positive impact. The ATC reports that the smokestacks and associated lights will be visible in the view shed of 15 vistas on the Appalachian Trail (AT). Studies have shown that quality of vistas and human impact on the environment are not only noticed by visitors but effect their experience. Another study published in the Journal of Applied Recreation Research, found that points of interests and views drew visitors' attention and had a significant impact on their perception of the trail. It was also found that particularly beautiful vistas helped visitors overlook elements that usually

have a negative effect on trail experience like increased trail traffic. A 2009 study in Leisure Sciences revealed that scenic value was a perceptual theme of Appalachian Trail visitors, and that things as simple as dead trees visible in a vista can have a negative impact on visitors overall perception. Imagine the effect the smokestacks will have from the 15 vistas from which they will be visible. The introduction of industrial activity made possible by the proposed rezoning in Ranson would have a negative effect on the scenic views of beautiful landscapes from the Appalachian Trail in Jefferson County.

The smokestacks are not all visitors will be able to see, the air pollution will create haze. The effect of regional haze on tourists was explored in a review article published in the *Atmospheric Environment* titled "Impaired visibility: the air pollution people see." A key takeaway on the negative affect of haze on vacationing tourists was summarized as follows: "Vacations offer an escape from the routine and stress of our daily lives. Vacation destinations are often chosen based on their scenery; vacations are spent gazing at monuments, mountains, clouds, and oceans. Good visibility allows clear observation of distant features and appreciation of the inherent beauty of these scenes...Air pollution, which is often present in both our cities and parks, interferes with these attributes and can ruin the views vacationers travel to enjoy." People seek bucolic, unspoiled areas to escape the stresses of urban areas. A 2004 study in *Environment and Behavior* found Perceived pollution causes stress while viewing natural scenes has both psychological and physiological benefits, and a 2007 study confirmed these benefits. Two other studies found that people are emotionally affected by poor visibility, and tourists are disappointed when views are obscured by haze. The combination of smokestacks and haze will mar the viewshed and will not only reduce the positive effects of a scenic landscape but also leave tourists disappointed and dissatisfied with their choice of destination. With these effects the welfare of the Harpers Ferry community would undoubtedly be endangered by the industry that this zoning change will provide for.

Multiple studies by doctors Kozar, Doctor, and Doctor have demonstrated that the land at this site to be rezoned is Karst with the highest likelihood of sinkhole development in the county, and that the ground water aquifer there is incredibly sensitive to contamination from surface water. Further, this site is on an upland plain with relatively few surface streams, seasonal variability in the water table that results in numerous estavelles, and large amounts of water in the epikarst. In this area contamination in surface water communicates easily to the water in the epikarst via diffuse and point infiltration, and the springs at the margins of the upland area are directly affected by the water quality throughout the aquifer. According to Jefferson Orchards Voluntary Remediation Plan with the WVDEP, the ground water at the site is approximately 60 feet below the ground, and the tests performed by the USGS have shown that ground water from just adjacent to this site emerged in the headwaters of both the Elk's Run and Rattlesnake Run. This is critically important for Harpers Ferry because the Elk's Run headwaters is a spring about three miles south east of the site and goes on to become the drinking water source for Harpers Ferry and Bolivar before emptying into the Potomac River. The headwaters of Rattlesnake Run is a spring about 3.5 miles from the site and is also a tributary of the Potomac River. The Potomac River is the back up water source for Harpers Ferry. This means that the activity at the site will have a critical influence on the drinking water

of Harpers Ferry. In this was the industry permitted by this change in zoning would undoubtedly endanger the health and safety of the community in Harpers Ferry.

The untoward health effects and individual economic consequences from the pollution emissions of the industry this rezoning will allow that will be born out over the length of peoples lives and that of their decedents for at least 3 generations is an egregious example of environmental injustice that should not be tolerated. This zoning change may be in one of the poorest sections of the county but the effects will be felt in every part of Ranson and the county.

The Comprehensive plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” The industry that this rezoning will allow will jeopardize the health, safety and welfare of Ranson, Harpers Ferry and the whole county. Please vote no on the ordinance #2017-302.

Sincerely,

mark harris

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on Ordinance #2017-302. Ranson's proposed zoning change presents a significant risk to the equine industry in Jefferson County and well beyond. The type of industry that would be allowed by the proposed zoning change in this location would jeopardize horse health, the groundwater supply, and workforce productivity. This will cause immediate shrinkage and threaten the long-term viability of the equine industry in the county.

The site of the proposed rezoning is less than six miles from Charles Town Races, with several breeding, training, and rehabilitation facilities between the two. The industry allowed by this rezoning would produce particulate, gaseous, and hazardous air emissions that would reach these sites. According to the WVDEP air permit, the Rockwool plant in Ranson is permitted to emit 250.87 tons of particulate matter per year into the air (1).

According to a recent study published in the journal of Veterinary Internal Medicine (2), horses are 15 times more sensitive to inhaled particulate matter than humans. Inhaled particulate matter can cause inflammation in horses' lungs that negatively affects performance. Inhaled particulate matter also contributes to the development of inflammatory airway disease (IAD) (3). IAD is a chronic airway disease that can affect horses long after their racing career is over. While there is little research on how other air pollutants affect horses, the effects of pollution on humans can be used to infer potential impact on horses. However unlike human models, these horses are elite athletes continuously exposed, and will thus likely experience detrimental effects at much lower levels of air pollution than humans.

The primary concern with air pollution is that increased levels of pollutants will increase inflammation in horses' lungs. Even small, subclinical amounts of inflammation in the lungs of horses negatively affect performance (2,3,4,5,6,11). This inflammation can also cause increased recovery times following racing (7,11). Reduced performance and training interruptions can lead to higher risk of injury, reduced winning average, fewer yearly starts, lower yearly

earnings, shortened career length, fewer lifetime starts, reduced lifetime earnings, and reduced quality of life (2,3,8,9,11). Each of these situations will lead to decreased return on investment, decreased cash flow, and decreased overall earnings for owners, trainers, and breeders with horses at Charles Town Races and in nearby areas.

While racing is usually a thoroughbred's first career, it is rarely their last. Some racing horses go on to be breeding stock, while others will have successful careers as sport horses. Jefferson County is an important source of new stock for sport horse trainers from Northern Virginia, and Maryland, and this is a resource for local horseman of both income and placement for horses not appropriate for breeding. However, if retired racehorses are unsound from injury or respiratory disease, they can be difficult to manage as breeding stock or unfit for a career as a sport horse. This affects the horse's quality of life and also places a burden on the industry locally and regionally.

The perception of decreased air quality from the increase in regional haze and visible smokestacks as one drives into the county will deter out of state owners and breeders from investing in West Virginia bred Race horses, decreasing or eliminating a critical \$50 million a year source of local business volume.

Another concern related to the proposed rezoning in Ranson is the risk of groundwater contamination as a result of the karst hydrogeology at the site and the industrial activity. Horsemen will either have to take on the expense of periodically testing water sources or they may not know local ground water is contaminated until their animals are sick. Veterinary care and testing adds expense and uncertainty to an industry that already deals with large inherent risks. The actual occurrence of ground water contamination would be devastating for Jefferson County's equine industry. For both geographic and financial reasons, it is simply impossible to think that the industry could solely use public or private utility-provided water if industrial activity fouled the local groundwater.

Finally, studies on US agricultural workers have demonstrated that increased air pollution decreases productivity of outdoors workers. This would place an additional burden on workers, small business owners and the industry.

The equine industry in Jefferson County is hundreds of years old. It is not worth risking this historic and economically valuable industry by rezoning for industrial companies like Rockwool. An economic impact study of the Charles Town Thoroughbred Horse Racing Industry on Jefferson County's economy found that the spending by owners, breeders, and trainers of the equine industry directly contributes \$79.4 million to the county each year. Out-of-state owners, breeders, and trainers spend more than \$50 million in Jefferson County every year. The value of total business volume in Jefferson County is \$191 million each year (10). These numbers do not include the effect of the handle or the casino.

The equine industry provides jobs for a broad cross-section of the public. This industry offers individuals of any educational background a variety of paths to achieve a good middle-income

living. Many jobs allow individuals to pursue apprenticeships or on-the-job training rather than requiring a costly college education. This flexibility allows for greater lifetime earnings and improved educational debt-to-earnings ratio for these workers. The equine industry also provides opportunities for non-traditional workers by offering job opportunities to those who may not be employable by larger corporations. This industry provides a variety of full-time, part-time, flexible, and pick-up work. Encouraging this type of flexible job ecosystem helps create a healthy economy with broad participation in employment and consumption.

The equine industry is a large conglomerate of small businesses, which have a multitude of economic benefits over having a few large businesses. It has been extensively reported that small locally owned businesses and start ups create more jobs, cultivate innovation, generate higher incomes, and provide more opportunities for individuals that would otherwise not exist than big non-local firms, which can actually depress local economies. The equine industry provides opportunities for small businesses and startups responsible for this growth of better jobs that are so good for the economy.

The equine industry offers so many other benefits that the industry in the rezoned area would not. For example, the equine industry supports local agriculture by providing a market for agricultural goods such as straw. The robust straw market supported by owners, trainers, and breeders allows for a third cash crop to be produced from one field in a year. Through pastureland and support of local agricultural goods, the equine industry protects and preserves the open spaces that give our county its bucolic quality and help attract tourists. Through the breeders' incentive programs, the equine industry offers unique opportunities to draft state funds back to Jefferson County, to name a few.

Rezoning this area of Ranson for Special District Industrial will allow in entities whose activities are harmful to the equine industry. The losses incurred by the equine industry would far outweigh any benefits derived from industries occupying the rezoned area. Sacrificing the long-term viability of one of our oldest and most productive industries for a net loss in business volume and economic value just does not make good sense for the local economy. Please vote NO on Ordinance #2017-302.

Sincerely,

John Doyle

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on #2017-302. The air emissions, possibility of ground and surface water contamination, and their effect on our interwoven economies threaten the health, safety and welfare of not just Jefferson County but the greater region, including Loudoun and the greater Northern Virginia area.

This zoning would provide for industry that produces large amounts of air emissions. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. Northern Virginia is directly downwind from these emissions. Much of the gaseous, fine particulate, and hazardous emissions can reach Northern Virginia. Further affecting the outdoor air quality of the adjacent portion of Virginia and the ability of these areas to achieve and maintain National Ambient Air Quality Standards (NAAQS) attainment. This will affect agriculture and outdoor leisure and recreation.

For example, Loudoun County has been in nonattainment for the NAAQS 8-hour Ozone standard for the past two years. VOC and NO_x react after they have been emitted to produce ground level ozone. The industry that this rezoning would provide for would produce large amounts of these emissions. This would make it even harder as Loudoun County tries to achieve attainment. As time goes on and the scientific research advances our knowledge and understanding of the extent to which gaseous, particulate and hazardous emissions affect human health the NAAQS standards are likely to be reduced. The effects on air emission from this rezoning will make it only harder for Loudoun and Northern Virginia to meet these standards.

In addition to the concerns about the air, the possible ground and surface water contamination is very concerning to Loudoun and Virginia residents. The site is known to have ground water that is vulnerable to contamination due to the karst hydrogeology. A USGS study demonstrated that the ground water adjacent to the site to be rezoned communicates readily with surface

water tributaries of the Potomac River. In addition to direct infiltration where water moves directly from the surface to groundwater via porous limestone bedrock, karst is known to have severe ground instability problems. This makes karst geology prone to sinkhole development. Sinkholes provide direct connection between the surface water and any contaminants it may contain and the groundwater. This makes the aquifer vulnerability in karst areas very high, and contamination with industrial activity such as that provided for by this rezoning too likely.

Loudoun sources its drinking water from the Potomac River, downstream of many West Virginia tributaries that carry water from the epikarst and groundwater aquifer at the site to be rezoned. Loudoun has recently completed the new Trap Rock Water Treatment facility, which draws water from the Potomac River. Loudoun currently provides 40 million gallons and projects to provide 90 million gallons of drinking water a day to customers by 2040 (Loudounwater.org). Therefore, the viability of the Potomac River is a high priority for Virginia residents.

Loudoun and Northern Virginia is one of the fastest growing communities in the country and provides a lot to Jefferson County in their symbiotic relationship. Virginia residents support and enjoy Jefferson County through tourism, as our residents enjoy the natural and historical resources of your county. Virginia residents and businesses support the equine industry in a multitude of ways from providing wagering fans at the races to the Virginia Breeders Association Virginia Certified incentive programs and a strong market for retired racehorses. According to an economic impact study from WVU, at least 40% of Jefferson County residents travel outside of West Virginia for work, a good percentage of those travel to northern Virginia. This rezoning would allow for industry that would negatively affect the economy of both places and this relationship and the benefits for our residents gleaned from it.

This zoning change will provide for industry that will negatively effect the health safety and welfare of the Loudon and Northern Virginia community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Pamela Briggs

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The city has failed to address the latter part of this objective. By Changing the SDI in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and child hood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health, and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and overall earnings for owners, breeders, and

trainers. This group provides over 70 million dollars in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. This industry would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitorship and again decreasing return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up this industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the Karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive plan is clear the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would have a negative effect on water and air quality in neighboring states such as Maryland.

The Potomac River provides drinking water and a source of recreation to Maryland residents. Water and air pollution generated within the Potomac River's watershed will inevitably contaminate this valuable waterway. The site of the proposed zoning change in Ranson is located within the Potomac River Watershed.

The type of industry that ordinance #2017-30 would allow in Ranson would generate large quantities of wastewater, stored on-site, in an area of known karst terrain. The West Virginia Department of Environmental Protection has published guidelines that specifically discourage extensive development in areas of karst terrain because of the vulnerability of karst aquifers to contamination by surface pollution. Karst features increase surface water and groundwater connectivity and any spills or surface releases quickly percolate into the groundwater. Additionally, sinkholes are common in karst terrain and can cause ruptures in wastewater impoundments. Even if appropriate attempts are made to contain and manage wastewater and other stormwater runoff on-site, there is still a high risk that wastewater could contaminate the groundwater through tears and catastrophic failure of wastewater impoundments. Contaminated groundwater in karst terrain can easily resurface in waterways several miles away, as shown by a USGS tracer study conducted near the site in Ranson. The USGS study detected tracer dye in multiple springs and waterways miles from the initial injection site in Ranson. All of these waterways drain into the Potomac River.

Mismanagement of wastewater could also lead to contamination of nearby surface waters. For example, the site of the proposed rezoning in Ranson is in the Rocky Marsh Run watershed. Rocky Marsh Run also drains to the Potomac River. Voting no on ordinance #2017-30 will

preserve downstream water quality and ensure that the Potomac River remains usable for Maryland residents.

Air pollution poses another risk to Maryland residents. The type of industry that ordinance #2017-302 would allow would generate air pollutants like fine particulate matter. According to the US EPA, fine particulates can travel 100s of miles from its original source. Air pollution related to industrial activity in Ranson could easily reach Maryland. Fine particulates have a greater affinity for carrying toxic compounds and their small size allows them to be inhaled more deeply into the lungs. Chronic exposure to fine particulate matter is associated with increased risk of Alzheimer's in adults. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. Fine particulate matter also exacerbates regional haze which creates a visible reminder of air pollution. The psychological effects that arise from an increased perception of pollution include stress, anxiety, and unhappiness. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of Maryland residents.

I again request that you vote no on ordinance #2017-302. Zoning decisions in Ranson and Jefferson County have an undeniable influence on the quality of life in neighboring states.

Sincerely,

Colleen Winters

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask that you vote no on Ordinance #2017-302. While not in Ranson, the land and homes around the property that is the subject of the zoning change are closer to the property than anyone who currently lives within the city limits of Ranson. This area will be affected sooner and more harshly by the environmental issues that will develop secondary to the inappropriate siting of industry this zoning would allow.

The subject land has been well studied by Drs. Kozar, Doctor and Doctor and described in the scientific literature and USGS reports as having karst hydrology with very high aquifer vulnerability. The karst landscape is a consequence of the presence of soluble bedrock, which consists of limestone in the case of the subject land. In such landscapes water percolates through the ground and dissolves the underlying rock creating a porous network of caverns and throughways. Karst aquifers are known to be "extremely vulnerable to pollution" due to direct connection between the surface water and groundwater through both point (sinkholes) and diffuse (everywhere) infiltration. It is known from the Voluntary Remediation Plan of Jefferson Orchard that the groundwater at the subject site is only 60 feet below the ground. The subject property and much of the property around it are on an upland plain with few surface streams, but great seasonal variability in the water table resulting in numerous esteves and large amounts of water in the epikarst. This water is easily contaminated and this contamination spreads quickly throughout the aquifer. Dye tests performed near the subject site by the USGS have demonstrated this quick moving thorough dispersment in the aquifer in this area. While this contamination goes on to affect springs at the margins of the upland area continuing on in streams that service municipal water sources and the Potomac River, our concerns are far more immediate in both time and distance. Well water is the only water source available in the area of the proposed zoning change and, with the exception of Fox Glen, a majority of this water is supplied by private wells. Therefore, the groundwater aquifer fulfills a critical necessity, fulfilling all needs including human consumption, household uses, and agriculture and

maintenance of livestock and horses in the immediate area around the site. The concern is that if the aquifer becomes contaminated, then the local drinking water will be fouled.

For decades now, policy makers have been using “Aquifer Vulnerability,” to set land use and water resource protection policy. Karst has very high Aquifer Vulnerability. Therefore, this industrial use is not appropriate for this land and it should not be zoned for it. The guiding documents of the WVDEP recognize this. The introduction to the WVDEP document Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.”

The Chesapeake Bay Stormwater Network karst stormwater guidance document the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed, which the WVDEP cites in its own guiding document Stormwater Management Design in Karst Areas, clearly agrees stating:

“First, the effect of land development on karst terrain is complex and hard to predict, and requires professional analysis to reduce the risk of geological hazards, damage to infrastructure and groundwater contamination.” “The working group acknowledges that past approaches to stormwater and land development in karst terrain have been inadequate to safeguard the public and the environment.” “...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” We clearly need stronger comprehensive land use plans and zoning that direct new growth away from karst areas to more appropriate locations. Ordinance #2017-302 is literally the opposite of this.

Further, we cannot rely on the WVDEP to do the job that good local land use guidelines and zoning should do. For example, the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed states that detention and retention ponds are not recommended on karst and categorize them as discouraged. Also, quoting WVDEP’s own karst guidance: “attenuating surface runoff will increase the rate of sinkhole formation and potential groundwater contamination.” Yet the entity currently planning to utilize this zoning change is planning employment of multiple massive retention ponds and attenuating surface runoff completely. This has already been approved by the DEP in two Construction Stormwater General Permit registrations for that company. One of detention ponds is not even regulated by the DEP as it contains process water and has no outlet. Clearly the DEP recognizes the risks but is not appropriately limiting them. Relying on the DEP to protect the public health, safety, welfare, and the environment from any entity in these karst locations is simply as the CNS bulletin said it “inadequate to safeguard the public and the environment.” We must have appropriate zoning that takes into consideration appropriate use of land with karst hydrogeology. Ordinance #2017-302 does not do this, but instead increases the risk to the public and the environment.

A second serious concern is the air emissions from the industry that this zoning will provide for. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. These types of air emissions have been shown to increase the risk of, contribute to, and exacerbate a multitude of developmental, physical, physiological, physiological, cognitive and economic. The exposure of one individual can cause repercussions in multiple generations. Embryos, fetuses, and children are most vulnerable with effects born out over a lifetime, and that of their offspring. Many of these effects only require short-term exposure and some have even been shown to occur at levels below current limits recommended by the World Health Organization. One example of this is that a recent study found that “Even within the limits set by the World Health Organization, the pollutants PM₁₀, SO₂, NO₂, and O₃ are associated with increased risk of treatment for respiratory diseases in children 0 to 6 years of age.” Unfortunately, the US limits are higher than WHO, 300 % higher in the case of PM₁₀!

In fact, in 2019, in the Advice from the Independent Particulate Matter Review Panel (formerly U.S. EPA Clean Air Scientific Advisory Committee Particulate Matter Review Panel) on EPA’s Policy Assessment for the Review of the National Ambient Air Quality Standards for Particulate Matter, it stated that the committee unanimously and unequivocally found that the current primary annual and 24-hour PM_{2.5} National Ambient Air Quality Standards (NAAQS) are not adequate to protect public health. The advice from this 20-member committee, whose scientific disciplines include epidemiology, medicine, toxicology, air quality measurement, air quality modeling, exposure assessment measurement and modeling, risk assessment, statistics, and others, was ignored due presumably to political pressure. Not only are the NAAQS too high in some cases, but due to the measure and mechanism by which they work, they can not replace the safety provided by good land use and zoning regulations, that are meant to do things like keep factories with air emissions and hundreds of heavy trucks away from elementary schools. In fact, there is a state law that prohibits siting a school near a factory. Unfortunately, the reciprocal law does not exist. Clearly, just like with the water resources, we cannot rely on the DEP or the EPA to do the job of what appropriate zoning should do. The whole point of zoning is to keep people safe and provide for their health and welfare. Ordinance #2017-302 puts families and school children directly in harms way.

The air emissions, threat to the groundwater, and the very presence of the industry that this zoning change will allow for will have a serious negative economic effect on those who live and or work closest to the site in question. Productivity and workforce participation will be negatively affected by the health effects of the air emissions. The local agricultural operations will be negatively affected by the air emissions with lower quantity and quality of crop yield and would be devastated if the ground water aquifer were fouled. The equine operations in the area, of which there are several, will be negatively affected by the air emissions as they affect the horses’ health and performance. The mere presence of the industry that will be provided for by this zoning change will cause property values to fall. There will be serious economic consequences for the immediate area around the site in question.

Several of the communities in the immediate area of the site for proposed zoning change are traditionally underserved and have lower economic status. The choice of this location for such a zoning change represents an egregious example of environmental injustice that should not be promulgated or tolerated.

This zoning change will provide for industry that will negatively affect the health safety and welfare of our community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Please think about our home. Heavy industry is not what we want or need. Nobody wants to live, raise children, put down roots, contribute to growing an area dotted with factories and smoke stacks. Jefferson Co is beautiful and worth saving. We already have the industry of Berkeley county nearby so let's keep our area clean.

Sincerely,

Martin Goon

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The city has failed to address the latter part of this objective. By Changing the SDI in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and child hood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health, and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and overall earnings for owners, breeders, and

trainers. This group provides over 70 million dollars in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. This industry would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitorship and again decreasing return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up this industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the Karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive plan is clear the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Sharon M. Canfield-Major

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that will significantly harm the municipalities within Jefferson County and beyond effecting the health, welfare, and safety of our community. Harpers Ferry is a national treasure with the natural and historic resources tours flock to see each year and one of the communities that will be negatively impacted by this zoning change.

According to a 2019 study by the West Virginia Tourism Office, Jefferson County generated and average of \$178 million per year in tourism-derived revenue for state and local governments over the last 10 years, more than any other county in West Virginia by at least double. Tourism benefits the businesses and economy of Ranson and Jefferson County producing \$213.7 million in individual earning, 7040 jobs, and \$842.6 million in direct spending here in 2018. We would need 40 Project Shuttles to replace the individual earnings and 59 Rockwools to replace the jobs provided by the tourism industry in Jefferson County. It is important to note that most of the money generated by tourism in Jefferson County comes from neighboring states. In this way it is like an export. Not simply recycling money but bringing money into the state increasing its wealth. Much of the economy in Harpers Ferry is based on this tourism industry. A threat to this industry poses a threat to the economy and welfare of our community.

One of the important drivers for tourism in Harpers Ferry is the Appalachian Trail. According to the Appalachian Trail Conservancy (ATC), Harpers Ferry is the psychologic midpoint of the Trail, and Hikers often plan extended stays in Jefferson County with an obvious positive impact. The ATC reports that the smokestacks and associated lights will be visible in the view shed of 15 vistas on the Appalachian Trail (AT). Studies have shown that quality of vistas and human impact on the environment are not only noticed by visitors but effect their experience. Another study published in the Journal of Applied Recreation Research, found that points of interests and views drew visitors' attention and had a significant impact on their perception of the trail. It was also found that particularly beautiful vistas helped visitors overlook elements that usually

have a negative effect on trail experience like increased trail traffic. A 2009 study in Leisure Sciences revealed that scenic value was a perceptual theme of Appalachian Trail visitors, and that things as simple as dead trees visible in a vista can have a negative impact on visitors overall perception. Imagine the effect the smokestacks will have from the 15 vistas from which they will be visible. The introduction of industrial activity made possible by the proposed rezoning in Ranson would have a negative effect on the scenic views of beautiful landscapes from the Appalachian Trail in Jefferson County.

The smokestacks are not all visitors will be able to see, the air pollution will create haze. The effect of regional haze on tourists was explored in a review article published in the *Atmospheric Environment* titled "Impaired visibility: the air pollution people see." A key takeaway on the negative affect of haze on vacationing tourists was summarized as follows: "Vacations offer an escape from the routine and stress of our daily lives. Vacation destinations are often chosen based on their scenery; vacations are spent gazing at monuments, mountains, clouds, and oceans. Good visibility allows clear observation of distant features and appreciation of the inherent beauty of these scenes...Air pollution, which is often present in both our cities and parks, interferes with these attributes and can ruin the views vacationers travel to enjoy." People seek bucolic, unspoiled areas to escape the stresses of urban areas. A 2004 study in *Environment and Behavior* found Perceived pollution causes stress while viewing natural scenes has both psychological and physiological benefits, and a 2007 study confirmed these benefits. Two other studies found that people are emotionally affected by poor visibility, and tourists are disappointed when views are obscured by haze. The combination of smokestacks and haze will mar the viewshed and will not only reduce the positive effects of a scenic landscape but also leave tourists disappointed and dissatisfied with their choice of destination. With these effects the welfare of the Harpers Ferry community would undoubtedly be endangered by the industry that this zoning change will provide for.

Multiple studies by doctors Kozar, Doctor, and Doctor have demonstrated that the land at this site to be rezoned is Karst with the highest likelihood of sinkhole development in the county, and that the ground water aquifer there is incredibly sensitive to contamination from surface water. Further, this site is on an upland plain with relatively few surface streams, seasonal variability in the water table that results in numerous estavelles, and large amounts of water in the epikarst. In this area contamination in surface water communicates easily to the water in the epikarst via diffuse and point infiltration, and the springs at the margins of the upland area are directly affected by the water quality throughout the aquifer. According to Jefferson Orchards Voluntary Remediation Plan with the WVDEP, the ground water at the site is approximately 60 feet below the ground, and the tests performed by the USGS have shown that ground water from just adjacent to this site emerged in the headwaters of both the Elk's Run and Rattlesnake Run. This is critically important for Harpers Ferry because the Elk's Run headwaters is a spring about three miles south east of the site and goes on to become the drinking water source for Harpers Ferry and Bolivar before emptying into the Potomac River. The headwaters of Rattlesnake Run is a spring about 3.5 miles from the site and is also a tributary of the Potomac River. The Potomac River is the back up water source for Harpers Ferry. This means that the activity at the site will have a critical influence on the drinking water

of Harpers Ferry. In this was the industry permitted by this change in zoning would undoubtedly endanger the health and safety of the community in Harpers Ferry.

The untoward health effects and individual economic consequences from the pollution emissions of the industry this rezoning will allow that will be born out over the length of peoples lives and that of their decedents for at least 3 generations is an egregious example of environmental injustice that should not be tolerated. This zoning change may be in one of the poorest sections of the county but the effects will be felt in every part of Ranson and the county.

The Comprehensive plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” The industry that this rezoning will allow will jeopardize the health, safety and welfare of Ranson, Harpers Ferry and the whole county. Please vote no on the ordinance #2017-302.

Sincerely,

David Barrett

Shepherdstown, 25443

I absolutely oppose heavy industry in our county.

I will also add that I am very pro-business and believe that many businesses will come here and provide jobs and a tax base that will help Ranson and Jefferson County grow!

Please say no to Rockwool and Heavy industry! Let's join the 21st century! We could be a new Loudoun County and grow and become more beautiful without heavy industry!

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on #2017-302. The air emissions, possibility of ground and surface water contamination, and their effect on our interwoven economies threaten the health, safety and welfare of not just Jefferson County but the greater region, including Loudoun and the greater Northern Virginia area.

This zoning would provide for industry that produces large amounts of air emissions. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. Northern Virginia is directly downwind from these emissions. Much of the gaseous, fine particulate, and hazardous emissions can reach Northern Virginia. Further affecting the outdoor air quality of the adjacent portion of Virginia and the ability of these areas to achieve and maintain National Ambient Air Quality Standards (NAAQS) attainment. This will affect agriculture and outdoor leisure and recreation.

For example, Loudoun County has been in nonattainment for the NAAQS 8-hour Ozone standard for the past two years. VOC and NO_x react after they have been emitted to produce ground level ozone. The industry that this rezoning would provide for would produce large amounts of these emissions. This would make it even harder as Loudoun County tries to achieve attainment. As time goes on and the scientific research advances our knowledge and understanding of the extent to which gaseous, particulate and hazardous emissions affect human health the NAAQS standards are likely to be reduced. The effects on air emission from this rezoning will make it only harder for Loudoun and Northern Virginia to meet these standards.

In addition to the concerns about the air, the possible ground and surface water contamination is very concerning to Loudoun and Virginia residents. The site is known to have ground water that is vulnerable to contamination due to the karst hydrogeology. A USGS study demonstrated that the ground water adjacent to the site to be rezoned communicates readily with surface

water tributaries of the Potomac River. In addition to direct infiltration where water moves directly from the surface to groundwater via porous limestone bedrock, karst is known to have severe ground instability problems. This makes karst geology prone to sinkhole development. Sinkholes provide direct connection between the surface water and any contaminants it may contain and the groundwater. This makes the aquifer vulnerability in karst areas very high, and contamination with industrial activity such as that provided for by this rezoning too likely.

Loudoun sources its drinking water from the Potomac River, downstream of many West Virginia tributaries that carry water from the epikarst and groundwater aquifer at the site to be rezoned. Loudoun has recently completed the new Trap Rock Water Treatment facility, which draws water from the Potomac River. Loudoun currently provides 40 million gallons and projects to provide 90 million gallons of drinking water a day to customers by 2040 (Loudounwater.org). Therefore, the viability of the Potomac River is a high priority for Virginia residents.

Loudoun and Northern Virginia is one of the fastest growing communities in the country and provides a lot to Jefferson County in their symbiotic relationship. Virginia residents support and enjoy Jefferson County through tourism, as our residents enjoy the natural and historical resources of your county. Virginia residents and businesses support the equine industry in a multitude of ways from providing wagering fans at the races to the Virginia Breeders Association Virginia Certified incentive programs and a strong market for retired racehorses. According to an economic impact study from WVU, at least 40% of Jefferson County residents travel outside of West Virginia for work, a good percentage of those travel to northern Virginia. This rezoning would allow for industry that would negatively affect the economy of both places and this relationship and the benefits for our residents gleaned from it.

This zoning change will provide for industry that will negatively effect the health safety and welfare of the Loudon and Northern Virginia community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

David Hennessey

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

This zoning change will provide for industry that will negatively affect the agriculture industry in Jefferson County and beyond. The combination of the air emissions and threat to the ground water resources could have devastating consequences for the agricultural community of Jefferson County.

The agriculture industry in Jefferson County is hundreds of years old and continues to serve our community well today. According to the economic impact study "A Shared Agenda for Growing West Virginia's Agricultural Economy, Prepared by Fourth Economy for West Virginia Department Of Agriculture West Virginia University Extension Service 2012," Jefferson County is the second highest producing county for crops sales, third highest for fruits and vegetables sales, and in the top 9 counties for sales of animals and animal products.

Agriculture, tourism and the equine industries work synergistically to have an outsized positive impact on the economy in Ranson and Jefferson County as a whole. Agriculture drives tourism by creating agro-tourism opportunities, preserving beautiful open spaces that contribute to the bucolic nature of our county, and providing the locally produced agriculture goods many tourists are look for in our markets and restaurants. Agriculture also supports the equine industry by providing local products like hay and straw, helping maintain pasture land, co-supporting local dual-purpose retail stores, and helping recycle by products. Agriculture helps maintain the way of life that many those who choose to live in Jefferson County enjoy. Industrial manufacturing and industry this zoning will provide for could never achieve these things.

Local agriculture also provides a source of locally produced agricultural goods. It has become apparent with the current pandemic and health emergency. This became a supply chain crisis because as our supply chains have moved to be ever more lean and efficient they lack resiliency and agility. By having a local source of agricultural goods and food we add resiliency and agility

into our own economy and community. The agricultural industry in Jefferson County provides this.

A plethora of scientific studies have shown that a variety of air pollutants produced by the type of industry this zoning change would provide for causes decreased yields of both quantity and quality for several of the crops important to Jefferson County including winter wheat and soybeans. Soybeans and wheat are two of the crops significantly affected and two of the most prevalent crops in Jefferson County. Lower crop yields harm the farms and all the members of the down stream supply chain as well as the consumer.

Recent studies have shown that even small increases in air pollution affect the productivity of agricultural workers. Similar to the reduction in crop yield this will negatively affect the individual workers, businesses, consumers and industry as a whole.

Even more devastating is the possibility of groundwater contamination. The land at the subject location has karst hydrogeology and as such has porous bedrock and severe ground instability problems. The porous bedrock allows rapid diffuse infiltration of surface water into ground water and the severe ground instability problems leads to sinkhole development. Sinkholes provide direct connection of the surface water with the ground water aquifer through point infiltration. In fact, according to a 2012 study by Doctor and Doctor, the subject location and that of Terrapins Neck have the highest sinkhole vulnerability of any sites in Jefferson County. The propensity and easy of diffuse and point infiltration in areas of karst hydrogeology give them very high aquifer vulnerability meaning the aquifer is very vulnerable to contamination. For this reason, this measure has been used for decades by policymakers to set land use regulations.

The WVDEP recognizes development in car karst areas puts water resources high-risk for contamination but also recognizes that this is best protected against true local land use and zoning ordinances. WVDEP's guiding document *Stormwater Management Design in Karst Areas* states, "it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." This document also references the Chesapeake Bay Stormwater Network karst stormwater guidance document the *CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed*. In which it states "...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." Land use policy in Ranson and zoning need to take aquifer vulnerability into consideration as these agencies and documents suggest.

The Jefferson Orchards Voluntary Remediation Plan application reports that the ground water is only 60 feet from the surface at the site. It is described in the scientific literature that this land is an upland plane with large amounts of water in the epikarst, and contamination of this

water effects the whole aquifer including the communications with surface water streams. A USGS study demonstrated that the groundwater adjacent to the site communicates readily with several surface water structures and wells miles away from the site. The effects of contamination at this site would go well beyond Ranson fouling large portions of the ground water and surface water in Jefferson County.

Groundwater contamination at the site would have devastating effects on the Agricultural industry in Jefferson county. For geographic and economic reasons it is simply infeasible for the agricultural industry to rely on utility provided water. Based on the scientific literature the site being considered for rezoning is one of the areas of highest aquifer vulnerability in Jefferson County and is inappropriate for the industry that this zoning change will provide for.

By threatening the local agricultural industry, the industry that this zoning will provide for will threaten the health, safety, and welfare of the community. The Comprehensive Plan in Ranson is clear the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

David Barrett

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The city has failed to address the latter part of this objective. By Changing the SDI in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and child hood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health, and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and overall earnings for owners, breeders, and

trainers. This group provides over 70 million dollars in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. This industry would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitorship and again decreasing return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up this industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the Karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive plan is clear the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Margarita Edmondson

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Personal comment after our signature below. Please read. Thank you very much for your time.

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask you to vote NO on Ordinance #2017-302. The industry this zoning change will allow for endangers the health, safety and, welfare of the community, and violates the premise of the smart code zoning that we have spent so much time, effort and federal money employing.

Any change in zoning needs to align with the comprehensive plan. In Ranson's current comprehensive plan (2012), the city only refers to "heavy industry" in the history section. Here it is characterized as part of a bygone era that has been replaced by an emphasis on agriculture for local food production, open spaces, and quality-of-life. In the remainder of the document, the word industry is used loosely to describe businesses including flower shops and shoe stores. Nothing that resembles the industry that this zoning change will provide for is described in the current comprehensive plan of Ranson.

In the land use section of the comprehensive plan, number ten states:

"Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The comprehensive plan clearly states that the city will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community. This change in zoning clearly negatively affects the health, safety, and welfare of the community.

As the zoning is proposed, the industry that this zoning change will allow for will be directly across the street from houses, parks and other small businesses. A densely populated

subdivision and an elementary school already exit directly across the street. While these latter community sections are not in the city limits, the effect of this zoning on them should still be considered just the same as it would be if they were in the city limits.

The industry that this zoning change will provide for will produce particulate, gaseous, and hazardous air emissions. These emissions have been shown to be detrimental to human health at every stage of life from embryo to old age. In utero and childhood exposure are the most damaging with lasting effects being realized through out life, and with maternal exposure the effects can be felt for generations. Multiple organ systems are affected including respiratory, cardiovascular, neurologic, immune, and endocrine causing defects in multiple processes including in utero development, neurodevelopment, immune and tolerance development, and cognitive defects. There are also psychological, social, and economic effects from both perceived and actual air pollution in both children and adults. Many of these effects can be seen even with short-term exposure or exposure that is lower than the levels recommended by the US Environmental Protection Agency and World Health Organization. These consequences are devastating to the individual and depressing to the local community and economy. State law does not allow a school to be built next to industry that this zoning will allow but yet we are contemplating changing the zoning so this industry can build next to a school. This does not make sense. As Ranson residents, we want Ranson to follow the lead of the state and keep polluting industry away from kids. In these ways, this change in zoning will negatively affect the health and welfare of the community.

In addition to the health effects of the air emissions is the threat to groundwater from the industry that this zoning change would allow. The land in question has karst hydrogeology and therefore very high aquifer vulnerability and is not appropriate for this industry. With the type of industry this zoning will provide for, combined with high aquifer vulnerability, the likelihood of groundwater contamination is too high for the community and region to bear. A USGS study demonstrated that contamination in the groundwater adjacent to the site moves relatively quickly and can be found in wells and surface water structures in a variety of locations in the County. In this way, contamination at the site would affect the drinking water of the great majority of Jefferson County residents. Through the surface water connections, the water at the site also affects the water resources of the region.

Aquifer vulnerability has been used by policy makers for decades to set land use regulations. The guiding document, from the WVDEP, Stormwater Management Design in Karst Areas states, "it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." In Ranson, we need to follow this advice and not change the zoning of this land for use by industry that has among the highest aquifer vulnerability in the County. This zoning change will endanger the safety of the community and region by endangering the safe water resources. As Ranson residents, we want to safeguard the water resources of the county and region by following the WVDEP guidance here.

Further, by reallocating this transect district and replacing it with a monolithic block of Special District Industrial designation, hundreds of housing units, parks and space for small businesses are lost. Ranson loses the potential for property tax on these properties and their improvements, Business and Occupational tax on the businesses and sales tax in retail stores. The community loses out on the opportunity to develop affordable housing and create locations where people can live, work, play, and shop all in the same place reducing the need for travel.

Worse yet apparently a deal has been made where the entity that owns the subject land has required that a litany of things not be built on the adjacent land essentially stripping the purpose of the smart code transect zone that exists there. Transect zones in the smart code are meant to transition, from out to in, and provide communities where people can safely work and live in close proximity in an effort to reduce travel. Excluding many of the components of the transect zone effectively eliminates the features that make it a transect zone, thus, losing the benefits a transect zone offers the community and city. By losing these benefits, reducing the overall and affordable housing prospects, and reducing so drastically the opportunities for city income, this zoning change will negatively affect the welfare of the community.

As Ranson residents, we find it odd that we are changing zoning to provide for industry that we would not put in the middle of our town close to our residents, but we are placing it close to the homes of county residents. Further, it is striking that the area where this change in zoning is directly adjacent to historically underserved lower income communities and a Title I school. This amounts to environmental injustice and cannot be tolerated.

The purpose of zoning is for a city to protect the health, welfare, morals and safety of the community. In this case, the air emissions and heavy truck traffic will endanger the communities' health. The threat of water contamination will endanger the safety of the community. The effect of lost productivity and decreased workforce participation due to increased illness and the negative effect the air emissions and presence of such a factory will have on the local economy will negatively affect the welfare of the community. The environmental injustice of changing the zoning to accommodate such polluting industry in a location where your municipality has no residents, but yet hundreds of low income and underserved county residents live is egregiously amoral. This must not happen. We respectfully implore you to do the right thing and vote no on ordinance #2017-302.

Sincerely,

Erin and Mike Valasek
Shepherdstown , 25443

P.S. We own a small business in Jefferson County and fear that Rockwool is going to cause so many negative changes in the county, pushing small business owners like ourselves to close. We also have three daughters that are competitive gymnasts and are on the Flip N Cheer team, which practices right down the road from Rockwool. Athletes breathing in that air 15-20 hours a week....not good at all. This has been so disheartening. Please vote no to save our children, our families, our air, our small businesses, our community. Thank you for taking the time to read this.

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would negatively affect tourism, economic agility, groundwater quality, and individual health in neighboring municipalities like Shepherdstown.

Tourism is critically important to Shepherdstown's economy and to the county as a whole. In 2018, tourist spending in the Jefferson County contributed over \$170 million to state and local government revenue and \$213 million in individual earnings. Importantly, most of this money comes from tourists visiting from neighboring states like Virginia, Maryland, and Washington D.C. Out-of-state tourists are largely drawn to Jefferson County because of its reputation for environmental-friendly, sustainable industry. Key elements that support this reputation include the county's pastoral scenery and pristine natural resources. Ordinance #2017-302 will allow industry into Jefferson County that risks harming these elements and dramatically reducing the area's appeal to visitors. The resulting harm to our tourist industry would drive away visitors and decrease state, county, and local revenue. The long-term success of Jefferson County's tourism industry is dependent on local governments making coordinated zoning decisions. Allowing certain types in industry in Ranson will negatively affect tourism in every municipality throughout the county, including Shepherdstown. Voting no on ordinance #2017-302 will protect the foundations of the county's tourism industry and protect the 7,040 jobs in Jefferson County that are directly supported by tourism.

The type of large, consolidated industry that ordinance #2017-302 would allow in Ranson would generally reduce the flexibility of local economies in Jefferson County. Historically, the driving industries in Jefferson County have been tourism, agriculture, and the equine industries. These three industries are large conglomerates of small businesses. Small business is very important to Sheherdstown. Small businesses have been shown to create more jobs, cultivate more innovation, and provide more opportunities than big, non-local firms. Additionally, small businesses have been shown to more reactive to sudden changes relative to manufacturing

businesses. Bringing large, manufacturing-based industry into Jefferson county will depress the local economy and stifle innovation. During this time of economic upheaval and uncertainty, Jefferson County needs to support industries that will allow local economies to adapt and recover as fast as possible.

Voting no on ordinance #2017-302 will help protect water resources throughout Jefferson County. The type of industry that ordinance #2017-302 would allow puts the ground resources of Jefferson county at significant risk due to the karst hydrogeology. The site in Ranson is in the Rocky Marsh Run watershed, which is in the source water protection zone for Shepherdstown and drains to the Potomac River. Therefore, activity at this site will affect both groundwater and surface water streams. In municipalities like Shepherdstown, many residents and nearby farms depend on wells for water. Contamination of groundwater aquifers would create both health and remediation concerns for local residents. Dye tests performed by the USGS near the area of proposed rezoning in Ranson have shown just how far-reaching groundwater contamination at the Ranson site could be. Results from the USGS study revealed measurable dye concentrations in Elk's Run, Rattlesnake Run, and even the Shepherdstown Town Run. This last run cuts through the center of Shepherdstown and is a favorite area for children to play and learn to fish.

Groundwater pollution is not the only concern for communities like Shepherdstown. The type of industry that ordinance #2017-302 would allow in Ranson would also generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. These pollutants are particularly harmful to children. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. The site in Ranson is across the road from an elementary school and also within the Jefferson High Middle district. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of children in Shepherdstown and all of Jefferson County.

I again request that you vote no on ordinance #2017-302. The long-term economic, environmental, and community health of municipalities like Shepherdstown depend on Ranson's participation in a coordinated zoning plan for all of Jefferson County.

Sincerely,

David Conaway
Shepherdstown , 25442

To: spfaltzgraff@ransonwv.us; dpierson@ransonwv.us; gtaylor@ransonwv.us; scoulter@frontiernet.net; tgrant@ransonwv.us; astroud@ransonwv.us; andersonantS@aol.com; donhainessr@gmail.com
Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote NO on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would have a negative effect on water and air quality in neighboring states such as Maryland.

The Potomac River provides drinking water and a source of recreation to Maryland residents. Water and air pollution generated within the Potomac River's watershed will inevitably contaminate this valuable waterway. The site of the proposed zoning change in Ranson is located within the Potomac River Watershed.

The type of industry that ordinance #2017-30 would allow in Ranson would utilize large water impoundments, in an area of known karst terrain. This water will be contaminant from several sources including particulate mater that has fallen out from the air emissions and process water. The West Virginia Department of Environmental Protection has published guidelines that specifically discourage extensive development in areas of karst terrain because of the vulnerability of karst aquifers to contamination by surface pollution. Karst features increase surface water and groundwater connectivity and any spills or surface releases quickly percolate into the groundwater. Additionally, sinkholes are common in karst terrain and can cause ruptures in wastewater impoundments. Even if appropriate attempts are made to contain and manage wastewater and other stormwater runoff on-site, there is still a high risk that wastewater could contaminate the groundwater through tears and catastrophic failure of wastewater impoundments. Contaminated groundwater in karst terrain can easily resurface in waterways several miles away, as shown by a USGS tracer study conducted near the site in to be rezoned. The USGS study detected tracer dye in multiple springs and waterways miles from the initial injection site in Ranson. All of these waterways drain into the Potomac River.

Mismanagement of wastewater could also lead to contamination of nearby surface waters. For example, the site of the proposed rezoning in Ranson is in the Rocky Marsh Run watershed.

Rocky Marsh Run also drains to the Potomac River. Voting no on ordinance #2017-302 will preserve downstream water quality and help ensure that the Potomac River remains usable for Maryland residents.

Air pollution poses another risk to Maryland residents. The type of industry that ordinance #2017-302 would allow would generate air pollutants like fine particulate matter. According to the US EPA, fine particulates can travel 100s of miles from its original source. Air pollution related to industrial activity in Ranson could easily reach Maryland. Fine particulates have a greater affinity for carrying toxic compounds and their small size allows them to be inhaled more deeply into the lungs. Chronic exposure to fine particulate matter is associated with increased risk of several diseases including Alzheimer's in adults. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease among others. Fine particulate matter also exacerbates regional haze which creates a visible reminder of air pollution. The psychological effects that arise from an increased perception of pollution include stress, anxiety, and unhappiness. Voting no on ordinance #2017-302 will help prevent increased air pollution from negatively affecting the long-term health of Maryland residents.

I again request that you vote NO on ordinance #2017-302. Zoning decisions in Ranson and Jefferson County have an undeniable influence on the quality of life in neighboring states.
Sincerely,

Jane Ladner

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The city has failed to address the latter part of this objective. By Changing the SDI in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and child hood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health, and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and overall earnings for owners, breeders, and

trainers. This group provides over 70 million dollars in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. This industry would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitorship and again decreasing return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up this industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the Karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive plan is clear the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Alex Dunn

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on Ordinance #2017-302. Ranson's proposed zoning change presents a significant risk to the equine industry in Jefferson County and well beyond. The type of industry that would be allowed by the proposed zoning change in this location would jeopardize horse health, the groundwater supply, and workforce productivity. This will cause immediate shrinkage and threaten the long-term viability of the equine industry in the county.

The site of the proposed rezoning is less than six miles from Charles Town Races, with several breeding, training, and rehabilitation facilities between the two. The industry allowed by this rezoning would produce particulate, gaseous, and hazardous air emissions that would reach these sites. According to the WVDEP air permit, the Rockwool plant in Ranson is permitted to emit 250.87 tons of particulate matter per year into the air (1).

According to a recent study published in the journal of Veterinary Internal Medicine (2), horses are 15 times more sensitive to inhaled particulate matter than humans. Inhaled particulate matter can cause inflammation in horses' lungs that negatively affects performance. Inhaled particulate matter also contributes to the development of inflammatory airway disease (IAD) (3). IAD is a chronic airway disease that can affect horses long after their racing career is over. While there is little research on how other air pollutants affect horses, the effects of pollution on humans can be used to infer potential impact on horses. However unlike human models, these horses are elite athletes continuously exposed, and will thus likely experience detrimental effects at much lower levels of air pollution than humans.

The primary concern with air pollution is that increased levels of pollutants will increase inflammation in horses' lungs. Even small, subclinical amounts of inflammation in the lungs of horses negatively affect performance (2,3,4,5,6,11). This inflammation can also cause increased recovery times following racing (7,11). Reduced performance and training interruptions can lead to higher risk of injury, reduced winning average, fewer yearly starts, lower yearly

earnings, shortened career length, fewer lifetime starts, reduced lifetime earnings, and reduced quality of life (2,3,8,9,11). Each of these situations will lead to decreased return on investment, decreased cash flow, and decreased overall earnings for owners, trainers, and breeders with horses at Charles Town Races and in nearby areas.

While racing is usually a thoroughbred's first career, it is rarely their last. Some racing horses go on to be breeding stock, while others will have successful careers as sport horses. Jefferson County is an important source of new stock for sport horse trainers from Northern Virginia, and Maryland, and this is a resource for local horseman of both income and placement for horses not appropriate for breeding. However, if retired racehorses are unsound from injury or respiratory disease, they can be difficult to manage as breeding stock or unfit for a career as a sport horse. This affects the horse's quality of life and also places a burden on the industry locally and regionally.

The perception of decreased air quality from the increase in regional haze and visible smokestacks as one drives into the county will deter out of state owners and breeders from investing in West Virginia bred Race horses, decreasing or eliminating a critical \$50 million a year source of local business volume.

Another concern related to the proposed rezoning in Ranson is the risk of groundwater contamination as a result of the karst hydrogeology at the site and the industrial activity. Horsemen will either have to take on the expense of periodically testing water sources or they may not know local ground water is contaminated until their animals are sick. Veterinary care and testing adds expense and uncertainty to an industry that already deals with large inherent risks. The actual occurrence of ground water contamination would be devastating for Jefferson County's equine industry. For both geographic and financial reasons, it is simply impossible to think that the industry could solely use public or private utility-provided water if industrial activity fouled the local groundwater.

Finally, studies on US agricultural workers have demonstrated that increased air pollution decreases productivity of outdoors workers. This would place an additional burden on workers, small business owners and the industry.

The equine industry in Jefferson County is hundreds of years old. It is not worth risking this historic and economically valuable industry by rezoning for industrial companies like Rockwool. An economic impact study of the Charles Town Thoroughbred Horse Racing Industry on Jefferson County's economy found that the spending by owners, breeders, and trainers of the equine industry directly contributes \$79.4 million to the county each year. Out-of-state owners, breeders, and trainers spend more than \$50 million in Jefferson County every year. The value of total business volume in Jefferson County is \$191 million each year (10). These numbers do not include the effect of the handle or the casino.

The equine industry provides jobs for a broad cross-section of the public. This industry offers individuals of any educational background a variety of paths to achieve a good middle-income

living. Many jobs allow individuals to pursue apprenticeships or on-the-job training rather than requiring a costly college education. This flexibility allows for greater lifetime earnings and improved educational debt-to-earnings ratio for these workers. The equine industry also provides opportunities for non-traditional workers by offering job opportunities to those who may not be employable by larger corporations. This industry provides a variety of full-time, part-time, flexible, and pick-up work. Encouraging this type of flexible job ecosystem helps create a healthy economy with broad participation in employment and consumption.

The equine industry is a large conglomerate of small businesses, which have a multitude of economic benefits over having a few large businesses. It has been extensively reported that small locally owned businesses and start ups create more jobs, cultivate innovation, generate higher incomes, and provide more opportunities for individuals that would other wise not exist than big non-local firms, which can actually depress local economies. The equine industry provides opportunities for small businesses and startups responsible for this growth of better jobs that are so good for the economy.

The equine industry offers so many other benefits that the industry in the rezoned area would not. For example, the equine industry supports local agriculture by providing a market for agricultural goods such as straw. The robust straw market supported by owners, trainers, and breeders allows for a third cash crop to be produced from one field in a year. Through pastureland and support of local agricultural goods, the equine industry protects and preserves the open spaces that give our county its bucolic quality and help attract tourists. Through the breeders' incentive programs, the equine industry offers unique opportunities to draft state funds back to Jefferson County, to name a few.

Rezoning this area of Ranson for Special District Industrial will allow in entities whose activities are harmful to the equine industry. The losses incurred by the equine industry would far outweigh any benefits derived from industries occupying the rezoned area. Sacrificing the long-term viability of one of our oldest and most productive industries for a net loss in business volume and economic value just does not make good sense for the local economy. Please vote NO on Ordinance #2017-302.

Sincerely,

Cathy Reifer

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would negatively affect tourism, economic agility, groundwater quality, and individual health in neighboring municipalities like Shepherdstown.

Tourism is critically important to Shepherdstown's economy and to the county as a whole. In 2018, tourist spending in the Jefferson County contributed over \$170 million to state and local government revenue and \$213 million in individual earnings. Importantly, most of this money comes from tourists visiting from neighboring states like Virginia, Maryland, and Washington D.C. Out-of-state tourists are largely drawn to Jefferson County because of its reputation for environmental-friendly, sustainable industry. Key elements that support this reputation include the county's pastoral scenery and pristine natural resources. Ordinance #2017-302 will allow industry into Jefferson County that risks harming these elements and dramatically reducing the area's appeal to visitors. The resulting harm to our tourist industry would drive away visitors and decrease state, county, and local revenue. The long-term success of Jefferson County's tourism industry is dependent on local governments making coordinated zoning decisions. Allowing certain types in industry in Ranson will negatively affect tourism in every municipality throughout the county, including Shepherdstown. Voting no on ordinance #2017-302 will protect the foundations of the county's tourism industry and protect the 7,040 jobs in Jefferson County that are directly supported by tourism.

The type of large, consolidated industry that ordinance #2017-302 would allow in Ranson would generally reduce the flexibility of local economies in Jefferson County. Historically, the driving industries in Jefferson County have been tourism, agriculture, and the equine industries. These three industries are large conglomerates of small businesses. Small business is very important to Sheherdstown. Small businesses have been shown to create more jobs, cultivate more innovation, and provide more opportunities than big, non-local firms. Additionally, small businesses have been shown to more reactive to sudden changes relative to manufacturing

businesses. Bringing large, manufacturing-based industry into Jefferson county will depress the local economy and stifle innovation. During this time of economic upheaval and uncertainty, Jefferson County needs to support industries that will allow local economies to adapt and recover as fast as possible.

Voting no on ordinance #2017-302 will help protect water resources throughout Jefferson County. The type of industry that ordinance #2017-302 would allow puts the ground resources of Jefferson county at significant risk due to the karst hydrogeology. The site in Ranson is in the Rocky Marsh Run watershed, which is in the source water protection zone for Shepherdstown and drains to the Potomac River. Therefore, activity at this site will affect both groundwater and surface water streams. In municipalities like Shepherdstown, many residents and nearby farms depend on wells for water. Contamination of groundwater aquifers would create both health and remediation concerns for local residents. Dye tests performed by the USGS near the area of proposed rezoning in Ranson have shown just how far-reaching groundwater contamination at the Ranson site could be. Results from the USGS study revealed measurable dye concentrations in Elk's Run, Rattlesnake Run, and even the Shepherdstown Town Run. This last run cuts through the center of Shepherdstown and is a favorite area for children to play and learn to fish.

Groundwater pollution is not the only concern for communities like Shepherdstown. The type of industry that ordinance #2017-302 would allow in Ranson would also generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. These pollutants are particularly harmful to children. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. The site in Ranson is across the road from an elementary school and also within the Jefferson High Middle district. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of children in Shepherdstown and all of Jefferson County.

I again request that you vote no on ordinance #2017-302. The long-term economic, environmental, and community health of municipalities like Shepherdstown depend on Ranson's participation in a coordinated zoning plan for all of Jefferson County.

What good is our "Forever Farm" land if it is too polluted to farm? Save the agrarian traditions of Jefferson Co!

Sincerely,

Alicia-Kate Halverson

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would have a negative effect on water and air quality in neighboring states such as Maryland.

The Potomac River provides drinking water and a source of recreation to Maryland residents. Water and air pollution generated within the Potomac River's watershed will inevitably contaminate this valuable waterway. The site of the proposed zoning change in Ranson is located within the Potomac River Watershed.

The type of industry that ordinance #2017-30 would allow in Ranson would generate large quantities of wastewater, stored on-site, in an area of known karst terrain. The West Virginia Department of Environmental Protection has published guidelines that specifically discourage extensive development in areas of karst terrain because of the vulnerability of karst aquifers to contamination by surface pollution. Karst features increase surface water and groundwater connectivity and any spills or surface releases quickly percolate into the groundwater. Additionally, sinkholes are common in karst terrain and can cause ruptures in wastewater impoundments. Even if appropriate attempts are made to contain and manage wastewater and other stormwater runoff on-site, there is still a high risk that wastewater could contaminate the groundwater through tears and catastrophic failure of wastewater impoundments. Contaminated groundwater in karst terrain can easily resurface in waterways several miles away, as shown by a USGS tracer study conducted near the site in Ranson. The USGS study detected tracer dye in multiple springs and waterways miles from the initial injection site in Ranson. All of these waterways drain into the Potomac River.

Mismanagement of wastewater could also lead to contamination of nearby surface waters. For example, the site of the proposed rezoning in Ranson is in the Rocky Marsh Run watershed. Rocky Marsh Run also drains to the Potomac River. Voting no on ordinance #2017-30 will

preserve downstream water quality and ensure that the Potomac River remains usable for Maryland residents.

Air pollution poses another risk to Maryland residents. The type of industry that ordinance #2017-302 would allow would generate air pollutants like fine particulate matter. According to the US EPA, fine particulates can travel 100s of miles from its original source. Air pollution related to industrial activity in Ranson could easily reach Maryland. Fine particulates have a greater affinity for carrying toxic compounds and their small size allows them to be inhaled more deeply into the lungs. Chronic exposure to fine particulate matter is associated with increased risk of Alzheimer's in adults. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. Fine particulate matter also exacerbates regional haze which creates a visible reminder of air pollution. The psychological effects that arise from an increased perception of pollution include stress, anxiety, and unhappiness. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of Maryland residents.

I again request that you vote no on ordinance #2017-302. Zoning decisions in Ranson and Jefferson County have an undeniable influence on the quality of life in neighboring states.

Sincerely,

Serrina Davis

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I strongly urge you to vote no on #2017-302. The air emissions, likely ground and surface water contamination, and their effect on our interwoven economies threaten the health, safety and welfare of not just Jefferson County but the greater region, including Loudoun and the greater Northern Virginia area.

This zoning would provide for industry that produces large amounts of air emissions. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. Northern Virginia is directly downwind from these emissions. Much of the gaseous, fine particulate, and hazardous emissions can reach Northern Virginia. Further affecting the outdoor air quality of the adjacent portion of Virginia and the ability of these areas to achieve and maintain National Ambient Air Quality Standards (NAAQS) attainment. This will affect agriculture and outdoor leisure and recreation - the defining characteristic and economic lifeblood of the region.

For example, Loudoun County has been in nonattainment for the NAAQS 8-hour Ozone standard for the past two years. VOC and NO_x react after they have been emitted to produce ground level ozone. The industry that this rezoning would provide for would produce large amounts of these emissions. This would make it even harder as Loudoun County tries to achieve attainment. As time goes on and the scientific research advances our knowledge and understanding of the extent to which gaseous, particulate and hazardous emissions affect human health the NAAQS standards are likely to be reduced. The effects on air emission from this rezoning will make it only harder for Loudoun and Northern Virginia to meet these standards.

In addition to the concerns about the air, the possible ground and surface water contamination is very concerning to Loudoun and Virginia residents. The site is known to have ground water that is vulnerable to contamination due to the karst hydrogeology. A USGS study demonstrated

that the ground water adjacent to the site to be rezoned communicates readily with surface water tributaries of the Potomac River. In addition to direct infiltration where water moves directly from the surface to groundwater via porous limestone bedrock, karst is known to have severe ground instability problems. This makes karst geology prone to sinkhole development. Sinkholes provide direct connection between the surface water and any contaminants it may contain and the groundwater. This makes the aquifer vulnerability in karst areas very high, and contamination with industrial activity such as that provided for by this rezoning too likely.

Loudoun sources its drinking water from the Potomac River, downstream of many West Virginia tributaries that carry water from the epikarst and groundwater aquifer at the site to be rezoned. Loudoun has recently completed the new Trap Rock Water Treatment facility, which draws water from the Potomac River. Loudoun currently provides 40 million gallons and projects to provide 90 million gallons of drinking water a day to customers by 2040 (Loudounwater.org). Therefore, the viability of the Potomac River is a high priority for Virginia residents.

Loudoun and Northern Virginia is one of the fastest growing communities in the country and provides a lot to Jefferson County in their symbiotic relationship. Virginia residents support and enjoy Jefferson County through tourism, as our residents enjoy the natural and historical resources of your county. Virginia residents and businesses support the equine industry in a multitude of ways from providing wagering fans at the races to the Virginia Breeders Association Virginia Certified incentive programs and a strong market for retired racehorses. According to an economic impact study from WVU, at least 40% of Jefferson County residents travel outside of West Virginia for work, a good percentage of those travel to northern Virginia. This rezoning would allow for industry that would negatively affect the economy of both places and this relationship and the benefits for our residents gleaned from it.

I also wish to add that I grew up visiting relatives in many parts of WV where high-pollution industries were frequently welcomed in with tax breaks under the premise of jobs. Not once in my experience did these ventures fail to bring more harm than good. Please learn from those who have gone before you.

This zoning change will provide for industry that will negatively effect the health safety and welfare of the Loudon and Northern Virginia community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Susan Boyd

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Steven Hula

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The city has failed to address the latter part of this objective. By Changing the SDI in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and child hood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health, and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and overall earnings for owners, breeders, and

trainers. This group provides over 70 million dollars in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. This industry would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitorship and again decreasing return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up this industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the Karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive plan is clear the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that will significantly harm the municipalities within Jefferson County and beyond effecting the health, welfare, and safety of our community. Harpers Ferry is a national treasure with the natural and historic resources tours flock to see each year and one of the communities that will be negatively impacted by this zoning change.

According to a 2019 study by the West Virginia Tourism Office, Jefferson County generated an average of \$178 million per year in tourism-derived revenue for state and local governments over the last 10 years, more than any other county in West Virginia by at least double. Tourism benefits the businesses and economy of Ranson and Jefferson County producing \$213.7 million in individual earning, 7040 jobs, and \$842.6 million in direct spending here in 2018. We would need 40 Project Shuttles to replace the individual earnings and 59 Rockwools to replace the jobs provided by the tourism industry in Jefferson County. It is important to note that most of the money generated by tourism in Jefferson County comes from neighboring states. In this way, it is like an export: not simply recycling money, but bringing money into the state increasing its wealth. Much of the economy in Harpers Ferry is based on this tourism industry. A threat to this industry poses a threat to the economy and welfare of our community.

One of the important drivers for tourism in Harpers Ferry is the Appalachian Trail. According to the Appalachian Trail Conservancy (ATC), Harpers Ferry is the psychologic midpoint of the Trail, and hikers often plan extended stays in Jefferson County with an obvious positive impact. The ATC reports that the smokestacks and associated lights will be visible in the viewshed of 15 vistas on the Appalachian Trail (AT). Studies have shown that quality of vistas and human impact on the environment are not only noticed by visitors, but effect their experience. Another study published in the Journal of Applied Recreation Research, found that points of interests and views drew visitors' attention and had a significant impact on their perception of the trail. It was also found that particularly beautiful vistas helped visitors overlook elements

that usually have a negative effect on trail experience like increased trail traffic. A 2009 study in Leisure Sciences revealed that scenic value was a perceptual theme of Appalachian Trail visitors, and that things as simple as dead trees visible in a vista can have a negative impact on visitors' overall perception. Imagine the effect the smokestacks will have from the 15 vistas from which they will be visible. The introduction of industrial activity made possible by the proposed rezoning in Ranson would have a negative effect on the scenic views of beautiful landscapes from the Appalachian Trail in Jefferson County.

The smokestacks are not all visitors will be able to see — the air pollution will create haze. The effect of regional haze on tourists was explored in a review article published in the Atmospheric Environment titled "Impaired visibility: the air pollution people see." A key takeaway on the negative affect of haze on vacationing tourists was summarized as follows:

"Vacations offer an escape from the routine and stress of our daily lives. Vacation destinations are often chosen based on their scenery; vacations are spent gazing at monuments, mountains, clouds, and oceans. Good visibility allows clear observation of distant features and appreciation of the inherent beauty of these scenes...Air pollution, which is often present in both our cities and parks, interferes with these attributes and can ruin the views vacationers travel to enjoy."

People seek bucolic, unspoiled areas to escape the stresses of urban areas. A 2004 study in Environment and Behavior found perceived pollution causes stress while viewing natural scenes has both psychological and physiological benefits, and a 2007 study confirmed these benefits. Two other studies found that people are emotionally affected by poor visibility, and tourists are disappointed when views are obscured by haze.

The combination of smokestacks and haze will mar the viewshed and will not only reduce the positive effects of a scenic landscape but also leave tourists disappointed and dissatisfied with their choice of destination. With these effects the welfare of the Harpers Ferry community would undoubtedly be endangered by the industry that this zoning change will provide for.

Multiple studies by doctors Kozar, Doctor, and Doctor have demonstrated that the land at this site to be rezoned is Karst with the highest likelihood of sinkhole development in the county, and that the groundwater aquifer there is incredibly sensitive to contamination from surface water. Further, this site is on an upland plain with relatively few surface streams, seasonal variability in the water table that results in numerous estavelles, and large amounts of water in the epikarst. In this area contamination in surface water communicates easily to the water in the epikarst via diffuse and point infiltration, and the springs at the margins of the upland area are directly affected by the water quality throughout the aquifer. According to Jefferson Orchards Voluntary Remediation Plan with the WVDEP, the groundwater at the site is approximately 60 feet below the ground, and the tests performed by the USGS have shown that groundwater from just adjacent to this site emerged in the headwaters of both the Elk's Run and Rattlesnake Run. This is critically important for Harpers Ferry because the Elk's Run headwaters is a spring about three miles southeast of the site and goes on to become the drinking water source for Harpers Ferry and Bolivar before emptying into the Potomac River.

The headwaters of Rattlesnake Run is a spring about 3.5 miles from the site and is also a tributary of the Potomac River. The Potomac River is the back up water source for Harpers Ferry. This means that the activity at the site will have a critical influence on the drinking water of Harpers Ferry. In this was the industry permitted by this change in zoning would undoubtedly endanger the health and safety of the community in Harpers Ferry.

The untoward health effects and individual economic consequences from the pollution emissions of the industry this rezoning will allow that will be born out over the length of people's lives and that of their decedents for at least three generations is an egregious example of environmental injustice that should not be tolerated. This zoning change may be in one of the poorest sections of the county, but the effects will be felt in every part of Ranson and the county.

The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." The industry that this rezoning will allow will jeopardize the health, safety and welfare of Ranson, Harpers Ferry and the whole county. Please vote no on the ordinance #2017-302.

Sincerely,

Dan Baltzell

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that will significantly harm the municipalities within Jefferson County and beyond effecting the health, welfare, and safety of our community. Harpers Ferry is a national treasure with the natural and historic resources tours flock to see each year and one of the communities that will be negatively impacted by this zoning change.

According to a 2019 study by the West Virginia Tourism Office, Jefferson County generated and average of \$178 million per year in tourism-derived revenue for state and local governments over the last 10 years, more than any other county in West Virginia by at least double. Tourism benefits the businesses and economy of Ranson and Jefferson County producing \$213.7 million in individual earning, 7040 jobs, and \$842.6 million in direct spending here in 2018. We would need 40 Project Shuttles to replace the individual earnings and 59 Rockwools to replace the jobs provided by the tourism industry in Jefferson County. It is important to note that most of the money generated by tourism in Jefferson County comes from neighboring states. In this way it is like an export. Not simply recycling money but bringing money into the state increasing its wealth. Much of the economy in Harpers Ferry is based on this tourism industry. A threat to this industry poses a threat to the economy and welfare of our community.

One of the important drivers for tourism in Harpers Ferry is the Appalachian Trail. According to the Appalachian Trail Conservancy (ATC), Harpers Ferry is the psychologic midpoint of the Trail, and Hikers often plan extended stays in Jefferson County with an obvious positive impact. The ATC reports that the smokestacks and associated lights will be visible in the view shed of 15 vistas on the Appalachian Trail (AT). Studies have shown that quality of vistas and human impact on the environment are not only noticed by visitors but effect their experience. Another study published in the Journal of Applied Recreation Research, found that points of interests and views drew visitors' attention and had a significant impact on their perception of the trail. It was also found that particularly beautiful vistas helped visitors overlook elements that usually

have a negative effect on trail experience like increased trail traffic. A 2009 study in Leisure Sciences revealed that scenic value was a perceptual theme of Appalachian Trail visitors, and that things as simple as dead trees visible in a vista can have a negative impact on visitors overall perception. Imagine the effect the smokestacks will have from the 15 vistas from which they will be visible. The introduction of industrial activity made possible by the proposed rezoning in Ranson would have a negative effect on the scenic views of beautiful landscapes from the Appalachian Trail in Jefferson County.

The smokestacks are not all visitors will be able to see, the air pollution will create haze. The effect of regional haze on tourists was explored in a review article published in the *Atmospheric Environment* titled "Impaired visibility: the air pollution people see." A key takeaway on the negative affect of haze on vacationing tourists was summarized as follows: "Vacations offer an escape from the routine and stress of our daily lives. Vacation destinations are often chosen based on their scenery; vacations are spent gazing at monuments, mountains, clouds, and oceans. Good visibility allows clear observation of distant features and appreciation of the inherent beauty of these scenes...Air pollution, which is often present in both our cities and parks, interferes with these attributes and can ruin the views vacationers travel to enjoy." People seek bucolic, unspoiled areas to escape the stresses of urban areas. A 2004 study in *Environment and Behavior* found Perceived pollution causes stress while viewing natural scenes has both psychological and physiological benefits, and a 2007 study confirmed these benefits. Two other studies found that people are emotionally affected by poor visibility, and tourists are disappointed when views are obscured by haze. The combination of smokestacks and haze will mar the viewshed and will not only reduce the positive effects of a scenic landscape but also leave tourists disappointed and dissatisfied with their choice of destination. With these effects the welfare of the Harpers Ferry community would undoubtedly be endangered by the industry that this zoning change will provide for.

Multiple studies by doctors Kozar, Doctor, and Doctor have demonstrated that the land at this site to be rezoned is Karst with the highest likelihood of sinkhole development in the county, and that the ground water aquifer there is incredibly sensitive to contamination from surface water. Further, this site is on an upland plain with relatively few surface streams, seasonal variability in the water table that results in numerous estavelles, and large amounts of water in the epikarst. In this area contamination in surface water communicates easily to the water in the epikarst via diffuse and point infiltration, and the springs at the margins of the upland area are directly affected by the water quality throughout the aquifer. According to Jefferson Orchards Voluntary Remediation Plan with the WVDEP, the ground water at the site is approximately 60 feet below the ground, and the tests performed by the USGS have shown that ground water from just adjacent to this site emerged in the headwaters of both the Elk's Run and Rattlesnake Run. This is critically important for Harpers Ferry because the Elk's Run headwaters is a spring about three miles south east of the site and goes on to become the drinking water source for Harpers Ferry and Bolivar before emptying into the Potomac River. The headwaters of Rattlesnake Run is a spring about 3.5 miles from the site and is also a tributary of the Potomac River. The Potomac River is the back up water source for Harpers Ferry. This means that the activity at the site will have a critical influence on the drinking water

of Harpers Ferry. In this was the industry permitted by this change in zoning would undoubtedly endanger the health and safety of the community in Harpers Ferry.

The untoward health effects and individual economic consequences from the pollution emissions of the industry this rezoning will allow that will be born out over the length of peoples lives and that of their decedents for at least 3 generations is an egregious example of environmental injustice that should not be tolerated. This zoning change may be in one of the poorest sections of the county but the effects will be felt in every part of Ranson and the county.

The Comprehensive plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” The industry that this rezoning will allow will jeopardize the health, safety and welfare of Ranson, Harpers Ferry and the whole county. Please vote no on the ordinance #2017-302.

Sincerely,

Michael DeMary

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

No heavy industry in this county!!!

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that will significantly harm the municipalities within Jefferson County and beyond effecting the health, welfare, and safety of our community. Harpers Ferry is a national treasure with the natural and historic resources tours flock to see each year and one of the communities that will be negatively impacted by this zoning change.

According to a 2019 study by the West Virginia Tourism Office, Jefferson County generated an average of \$178 million per year in tourism-derived revenue for state and local governments over the last 10 years, more than any other county in West Virginia by at least double. Tourism benefits the businesses and economy of Ranson and Jefferson County producing \$213.7 million in individual earning, 7040 jobs, and \$842.6 million in direct spending here in 2018. We would need 40 Project Shuttles to replace the individual earnings and 59 Rockwools to replace the jobs provided by the tourism industry in Jefferson County. It is important to note that most of the money generated by tourism in Jefferson County comes from neighboring states. In this way, it is like an export: not simply recycling money, but bringing money into the state increasing its wealth. Much of the economy in Harpers Ferry is based on this tourism industry. A threat to this industry poses a threat to the economy and welfare of our community.

One of the important drivers for tourism in Harpers Ferry is the Appalachian Trail. According to the Appalachian Trail Conservancy (ATC), Harpers Ferry is the psychologic midpoint of the Trail, and hikers often plan extended stays in Jefferson County with an obvious positive impact. The ATC reports that the smokestacks and associated lights will be visible in the viewshed of 15 vistas on the Appalachian Trail (AT). Studies have shown that quality of vistas and human impact on the environment are not only noticed by visitors, but effect their experience. Another study published in the Journal of Applied Recreation Research, found that points of

interests and views drew visitors' attention and had a significant impact on their perception of the trail. It was also found that particularly beautiful vistas helped visitors overlook elements that usually have a negative effect on trail experience like increased trail traffic. A 2009 study in Leisure Sciences revealed that scenic value was a perceptual theme of Appalachian Trail visitors, and that things as simple as dead trees visible in a vista can have a negative impact on visitors' overall perception. Imagine the effect the smokestacks will have from the 15 vistas from which they will be visible. The introduction of industrial activity made possible by the proposed rezoning in Ranson would have a negative effect on the scenic views of beautiful landscapes from the Appalachian Trail in Jefferson County.

The smokestacks are not all visitors will be able to see — the air pollution will create haze. The effect of regional haze on tourists was explored in a review article published in the Atmospheric Environment titled "Impaired visibility: the air pollution people see." A key takeaway on the negative affect of haze on vacationing tourists was summarized as follows:

"Vacations offer an escape from the routine and stress of our daily lives. Vacation destinations are often chosen based on their scenery; vacations are spent gazing at monuments, mountains, clouds, and oceans. Good visibility allows clear observation of distant features and appreciation of the inherent beauty of these scenes...Air pollution, which is often present in both our cities and parks, interferes with these attributes and can ruin the views vacationers travel to enjoy."

People seek bucolic, unspoiled areas to escape the stresses of urban areas. A 2004 study in Environment and Behavior found perceived pollution causes stress while viewing natural scenes has both psychological and physiological benefits, and a 2007 study confirmed these benefits. Two other studies found that people are emotionally affected by poor visibility, and tourists are disappointed when views are obscured by haze.

The combination of smokestacks and haze will mar the viewshed and will not only reduce the positive effects of a scenic landscape but also leave tourists disappointed and dissatisfied with their choice of destination. With these effects the welfare of the Harpers Ferry community would undoubtedly be endangered by the industry that this zoning change will provide for.

Multiple studies by doctors Kozar, Doctor, and Doctor have demonstrated that the land at this site to be rezoned is Karst with the highest likelihood of sinkhole development in the county, and that the groundwater aquifer there is incredibly sensitive to contamination from surface water. Further, this site is on an upland plain with relatively few surface streams, seasonal variability in the water table that results in numerous estavelles, and large amounts of water in the epikarst. In this area contamination in surface water communicates easily to the water in the epikarst via diffuse and point infiltration, and the springs at the margins of the upland area are directly affected by the water quality throughout the aquifer. According to Jefferson Orchards Voluntary Remediation Plan with the WVDEP, the groundwater at the site is approximately 60 feet below the ground, and the tests performed by the USGS have shown that groundwater from just adjacent to this site emerged in the headwaters of both the Elk's Run and Rattlesnake Run. This is critically important for Harpers Ferry because the Elk's Run

headwaters is a spring about three miles southeast of the site and goes on to become the drinking water source for Harpers Ferry and Bolivar before emptying into the Potomac River. The headwaters of Rattlesnake Run is a spring about 3.5 miles from the site and is also a tributary of the Potomac River. The Potomac River is the back up water source for Harpers Ferry. This means that the activity at the site will have a critical influence on the drinking water of Harpers Ferry. In this was the industry permitted by this change in zoning would undoubtedly endanger the health and safety of the community in Harpers Ferry.

The untoward health effects and individual economic consequences from the pollution emissions of the industry this rezoning will allow that will be born out over the length of people's lives and that of their decedents for at least three generations is an egregious example of environmental injustice that should not be tolerated. This zoning change may be in one of the poorest sections of the county, but the effects will be felt in every part of Ranson and the county.

The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." The industry that this rezoning will allow will jeopardize the health, safety and welfare of Ranson, Harpers Ferry and the whole county. Please vote no on the ordinance #2017-302.

Sincerely,

Kellie Tatem

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on #2017-302. The air emissions, possibility of ground and surface water contamination, and their effect on our interwoven economies threaten the health, safety and welfare of not just Jefferson County but the greater region, including Loudoun and the greater Northern Virginia area.

This zoning would provide for industry that produces large amounts of air emissions. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. Northern Virginia is directly downwind from these emissions. Much of the gaseous, fine particulate, and hazardous emissions can reach Northern Virginia. Further affecting the outdoor air quality of the adjacent portion of Virginia and the ability of these areas to achieve and maintain National Ambient Air Quality Standards (NAAQS) attainment. This will affect agriculture and outdoor leisure and recreation.

For example, Loudoun County has been in nonattainment for the NAAQS 8-hour Ozone standard for the past two years. VOC and NO_x react after they have been emitted to produce ground level ozone. The industry that this rezoning would provide for would produce large amounts of these emissions. This would make it even harder as Loudoun County tries to achieve attainment. As time goes on and the scientific research advances our knowledge and understanding of the extent to which gaseous, particulate and hazardous emissions affect human health the NAAQS standards are likely to be reduced. The effects on air emission from this rezoning will make it only harder for Loudoun and Northern Virginia to meet these standards.

In addition to the concerns about the air, the possible ground and surface water contamination is very concerning to Loudoun and Virginia residents. The site is known to have ground water that is vulnerable to contamination due to the karst hydrogeology. A USGS study demonstrated that the ground water adjacent to the site to be rezoned communicates readily with surface

water tributaries of the Potomac River. In addition to direct infiltration where water moves directly from the surface to groundwater via porous limestone bedrock, karst is known to have severe ground instability problems. This makes karst geology prone to sinkhole development. Sinkholes provide direct connection between the surface water and any contaminants it may contain and the groundwater. This makes the aquifer vulnerability in karst areas very high, and contamination with industrial activity such as that provided for by this rezoning too likely.

Loudoun sources its drinking water from the Potomac River, downstream of many West Virginia tributaries that carry water from the epikarst and groundwater aquifer at the site to be rezoned. Loudoun has recently completed the new Trap Rock Water Treatment facility, which draws water from the Potomac River. Loudoun currently provides 40 million gallons and projects to provide 90 million gallons of drinking water a day to customers by 2040 (Loudounwater.org). Therefore, the viability of the Potomac River is a high priority for Virginia residents.

Loudoun and Northern Virginia is one of the fastest growing communities in the country and provides a lot to Jefferson County in their symbiotic relationship. Virginia residents support and enjoy Jefferson County through tourism, as our residents enjoy the natural and historical resources of your county. Virginia residents and businesses support the equine industry in a multitude of ways from providing wagering fans at the races to the Virginia Breeders Association Virginia Certified incentive programs and a strong market for retired racehorses. According to an economic impact study from WVU, at least 40% of Jefferson County residents travel outside of West Virginia for work, a good percentage of those travel to northern Virginia. This rezoning would allow for industry that would negatively affect the economy of both places and this relationship and the benefits for our residents gleaned from it.

This zoning change will provide for industry that will negatively effect the health safety and welfare of the Loudon and Northern Virginia community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Matthew Altenburger

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask you to vote NO on Ordinance #2017-302. The industry this zoning change will allow for endangers the health, safety and, welfare of the community, and violates the premise of the smart code zoning that we have spent so much time, effort and federal money employing.

This zoning change will provide for industry that will negatively affect the agriculture industry in Jefferson County and beyond. The combination of the air emissions and threat to the ground water resources could have devastating consequences for the agricultural community of Jefferson County.

The agriculture industry in Jefferson County is hundreds of years old and continues to serve our community well today. According to the economic impact study "A Shared Agenda for Growing West Virginia's Agricultural Economy, Prepared by Fourth Economy for West Virginia Department Of Agriculture West Virginia University Extension Service 2012," Jefferson County is the second highest producing county for crops sales, third highest for fruits and vegetables sales, and in the top 9 counties for sales of animals and animal products.

Agriculture, tourism and the equine industries work synergistically to have an outsized positive impact on the economy in Ranson and Jefferson County as a whole. Agriculture drives tourism by creating agro-tourism opportunities, preserving beautiful open spaces that contribute to the bucolic nature of our county, and providing the locally produced agriculture goods many tourists are look for in our markets and restaurants. Agriculture also supports the equine industry by providing local products like hay and straw, helping maintain pasture land, co-supporting local dual-purpose retail stores, and helping recycle by products. Agriculture helps maintain the way of life that many those who choose to live in Jefferson County enjoy. Industrial manufacturing and industry this zoning will provide for could never achieve these things.

Local agriculture also provides a source of locally produced agricultural goods. It has become apparent with the current pandemic and health emergency. This became a supply chain crisis because as our supply chains have moved to be ever more lean and efficient they lack resiliency and agility. By having a local source of agricultural goods and food we add resiliency and agility into our own economy and community. The agricultural industry in Jefferson County provides this.

A plethora of scientific studies have shown that a variety of air pollutants produced by the type of industry this zoning change would provide for causes decreased yields of both quantity and quality for several of the crops important to Jefferson County including winter wheat and soybeans. Soybeans and wheat are two of the crops significantly affected and two of the most prevalent crops in Jefferson County. Lower crop yields harm the farms and all the members of the down stream supply chain as well as the consumer.

Recent studies have shown that even small increases in air pollution affect the productivity of agricultural workers. Similar to the reduction in crop yield this will negatively affect the individual workers, businesses, consumers and industry as a whole.

Even more devastating is the possibility of groundwater contamination. The land at the subject location has karst hydrogeology and as such has porous bedrock and severe ground instability problems. The porous bedrock allows rapid diffuse infiltration of surface water into ground water and the severe ground instability problems leads to sinkhole development. Sinkholes provide direct connection of the surface water with the ground water aquifer through point infiltration. In fact, according to a 2012 study by Doctor and Doctor, the subject location and that of Terrapins Neck have the highest sinkhole vulnerability of any sites in Jefferson County. The propensity and easy of diffuse and point infiltration in areas of karst hydrogeology give them very high aquifer vulnerability meaning the aquifer is very vulnerable to contamination. For this reason, this measure has been used for decades by policymakers to set land use regulations.

The WVDEP recognizes development in karst areas puts water resources high-risk for contamination but also recognizes that this is best protected against true local land use and zoning ordinances. WVDEP's guiding document Stormwater Management Design in Karst Areas states, "it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." This document also references the Chesapeake Bay Stormwater Network karst stormwater guidance document the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed. In which it states "...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more

appropriate locations.” Land use policy in Ranson and zoning need to take aquifer vulnerability into consideration as these agencies and documents suggest.

The Jefferson Orchards Voluntary Remediation Plan application reports that the ground water is only 60 feet from the surface at the site. It is described in the scientific literature that this land is an upland plane with large amounts of water in the epikarst, and contamination of this water effects the whole aquifer including the communications with surface water streams. A USGS study demonstrated that the groundwater adjacent to the site communicates readily with several surface water structures and wells miles away from the site. The effects of contamination at this site would go well beyond Ranson fouling large portions of the ground water and surface water in Jefferson County.

Groundwater contamination at the site would have devastating effects on the Agricultural industry in Jefferson county. For geographic and economic reasons it is simply infeasible for the agricultural industry to rely on utility provided water. Based on the scientific literature the site being considered for rezoning is one of the areas of highest aquifer vulnerability in Jefferson County and is inappropriate for the industry that this zoning change will provide for.

The industry that this zoning will provide for will threaten the health, safety, and welfare of the community by threatening the agriculture industry's ability to produce. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Please protect Jefferson and Berkeley County Forever farmland by voting "no" on heavy industry in Jefferson County!

Sincerely,

Alicia-Kate Halverson

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The city has failed to address the latter part of this objective. By Changing the SDI in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and child hood as development is exquisitely sensitive during these times, but the effects are realized through out life negatively impacting a variety of lifetime parameters including physical and mental health, and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over 70 million dollars in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and over all earnings. This industry would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitorship and again decreasing return on investment, cash flow, and over all earnings for the hundreds of small businesses that make up this industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the Karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive plan is clear the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Louise Purdy

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would have a negative effect on water and air quality in neighboring states such as Maryland.

The Potomac River provides drinking water and a source of recreation to Maryland residents. Water and air pollution generated within the Potomac River's watershed will inevitably contaminate this valuable waterway. The site of the proposed zoning change in Ranson is located within the Potomac River Watershed.

The type of industry that ordinance #2017-30 would allow in Ranson would generate large quantities of wastewater, stored on-site, in an area of known karst terrain. The West Virginia Department of Environmental Protection has published guidelines that specifically discourage extensive development in areas of karst terrain because of the vulnerability of karst aquifers to contamination by surface pollution. Karst features increase surface water and groundwater connectivity and any spills or surface releases quickly percolate into the groundwater. Additionally, sinkholes are common in karst terrain and can cause ruptures in wastewater impoundments. Even if appropriate attempts are made to contain and manage wastewater and other stormwater runoff on-site, there is still a high risk that wastewater could contaminate the groundwater through tears and catastrophic failure of wastewater impoundments. Contaminated groundwater in karst terrain can easily resurface in waterways several miles away, as shown by a USGS tracer study conducted near the site in Ranson. The USGS study detected tracer dye in multiple springs and waterways miles from the initial injection site in Ranson. All of these waterways drain into the Potomac River.

Mismanagement of wastewater could also lead to contamination of nearby surface waters. For example, the site of the proposed rezoning in Ranson is in the Rocky Marsh Run watershed. Rocky Marsh Run also drains to the Potomac River. Voting no on ordinance #2017-30 will

preserve downstream water quality and ensure that the Potomac River remains usable for Maryland residents.

Air pollution poses another risk to Maryland residents. The type of industry that ordinance #2017-302 would allow would generate air pollutants like fine particulate matter. According to the US EPA, fine particulates can travel 100s of miles from its original source. Air pollution related to industrial activity in Ranson could easily reach Maryland. Fine particulates have a greater affinity for carrying toxic compounds and their small size allows them to be inhaled more deeply into the lungs. Chronic exposure to fine particulate matter is associated with increased risk of Alzheimer's in adults. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. Fine particulate matter also exacerbates regional haze which creates a visible reminder of air pollution. The psychological effects that arise from an increased perception of pollution include stress, anxiety, and unhappiness. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of Maryland residents.

I again request that you vote no on ordinance #2017-302. Zoning decisions in Ranson and Jefferson County have an undeniable influence on the quality of life in neighboring states.

Sincerely,

Lana MontgoMery

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would have a negative effect on water and air quality in neighboring states such as Maryland.

The Potomac River provides drinking water and a source of recreation to Maryland residents. Water and air pollution generated within the Potomac River's watershed will inevitably contaminate this valuable waterway. The site of the proposed zoning change in Ranson is located within the Potomac River Watershed.

The type of industry that ordinance #2017-30 would allow in Ranson would utilize large water impoundments, in an area of known karst terrain. This water will be contaminant from several sources including particulate mater that has fallen out from the air emissions and process water. The West Virginia Department of Environmental Protection has published guidelines that specifically discourage extensive development in areas of karst terrain because of the vulnerability of karst aquifers to contamination by surface pollution. Karst features increase surface water and groundwater connectivity and any spills or surface releases quickly percolate into the groundwater. Additionally, sinkholes are common in karst terrain and can cause ruptures in wastewater impoundments. Even if appropriate attempts are made to contain and manage wastewater and other stormwater runoff on-site, there is still a high risk that wastewater could contaminate the groundwater through tears and catastrophic failure of wastewater impoundments. Contaminated groundwater in karst terrain can easily resurface in waterways several miles away, as shown by a USGS tracer study conducted near the site in to be rezoned. The USGS study detected tracer dye in multiple springs and waterways miles from the initial injection site in Ranson. All of these waterways drain into the Potomac River.

Mismanagement of wastewater could also lead to contamination of nearby surface waters. For example, the site of the proposed rezoning in Ranson is in the Rocky Marsh Run watershed.

Rocky Marsh Run also drains to the Potomac River. Voting no on ordinance #2017-302 will preserve downstream water quality and help ensure that the Potomac River remains usable for Maryland residents.

Air pollution poses another risk to Maryland residents. The type of industry that ordinance #2017-302 would allow would generate air pollutants like fine particulate matter. According to the US EPA, fine particulates can travel 100s of miles from its original source. Air pollution related to industrial activity in Ranson could easily reach Maryland. Fine particulates have a greater affinity for carrying toxic compounds and their small size allows them to be inhaled more deeply into the lungs. Chronic exposure to fine particulate matter is associated with increased risk of several diseases including Alzheimer's in adults. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease among others. Fine particulate matter also exacerbates regional haze which creates a visible reminder of air pollution. The psychological effects that arise from an increased perception of pollution include stress, anxiety, and unhappiness. Voting no on ordinance #2017-302 will help prevent increased air pollution from negatively affecting the long-term health of Maryland residents.

For the reasons stated above, I again request that you vote no on ordinance #2017-302. Zoning decisions in Ranson and Jefferson County have an undeniable influence on the quality of life in neighboring states.

Sincerely,

Mare Cromwell

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The city has failed to address the latter part of this objective. By Changing the SDI in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and child hood as development is exquisitely sensitive during these times, but the effects are realized through out life negatively impacting a variety of lifetime parameters including physical and mental health, and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over 70 million dollars in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and over all earnings. This industry would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitorship and again decreasing return on investment, cash flow, and over all earnings for the hundreds of small businesses that make up this industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the Karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive plan is clear the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Cynthia Huesman

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would have a negative effect on water and air quality in neighboring states such as Maryland.

The Potomac River provides drinking water and a source of recreation to Maryland residents. Water and air pollution generated within the Potomac River's watershed will inevitably contaminate this valuable waterway. The site of the proposed zoning change in Ranson is located within the Potomac River Watershed.

The type of industry that ordinance #2017-30 would allow in Ranson would generate large quantities of wastewater, stored on-site, in an area of known karst terrain. The West Virginia Department of Environmental Protection has published guidelines that specifically discourage extensive development in areas of karst terrain because of the vulnerability of karst aquifers to contamination by surface pollution. Karst features increase surface water and groundwater connectivity and any spills or surface releases quickly percolate into the groundwater. Additionally, sinkholes are common in karst terrain and can cause ruptures in wastewater impoundments. Even if appropriate attempts are made to contain and manage wastewater and other stormwater runoff on-site, there is still a high risk that wastewater could contaminate the groundwater through tears and catastrophic failure of wastewater impoundments. Contaminated groundwater in karst terrain can easily resurface in waterways several miles away, as shown by a USGS tracer study conducted near the site in Ranson. The USGS study detected tracer dye in multiple springs and waterways miles from the initial injection site in Ranson. All of these waterways drain into the Potomac River.

Mismanagement of wastewater could also lead to contamination of nearby surface waters. For example, the site of the proposed rezoning in Ranson is in the Rocky Marsh Run watershed. Rocky Marsh Run also drains to the Potomac River. Voting no on ordinance #2017-30 will

preserve downstream water quality and ensure that the Potomac River remains usable for Maryland residents.

Air pollution poses another risk to Maryland residents. The type of industry that ordinance #2017-302 would allow would generate air pollutants like fine particulate matter. According to the US EPA, fine particulates can travel 100s of miles from its original source. Air pollution related to industrial activity in Ranson could easily reach Maryland. Fine particulates have a greater affinity for carrying toxic compounds and their small size allows them to be inhaled more deeply into the lungs. Chronic exposure to fine particulate matter is associated with increased risk of Alzheimer's in adults. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. Fine particulate matter also exacerbates regional haze which creates a visible reminder of air pollution. The psychological effects that arise from an increased perception of pollution include stress, anxiety, and unhappiness. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of Maryland residents.

I again request that you vote no on ordinance #2017-302. Zoning decisions in Ranson and Jefferson County have an undeniable influence on the quality of life in neighboring states.

Sincerely,

Joanne Horn

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on #2017-302. The air emissions, possibility of ground and surface water contamination, and their effect on our interwoven economies threaten the health, safety and welfare of not just Jefferson County but the greater region, including Loudoun and the greater Northern Virginia area.

This zoning would provide for industry that produces large amounts of air emissions. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. Northern Virginia is directly downwind from these emissions. Much of the gaseous, fine particulate, and hazardous emissions can reach Northern Virginia. Further affecting the outdoor air quality of the adjacent portion of Virginia and the ability of these areas to achieve and maintain National Ambient Air Quality Standards (NAAQS) attainment. This will affect agriculture and outdoor leisure and recreation.

For example, Loudoun County has been in nonattainment for the NAAQS 8-hour Ozone standard for the past two years. VOC and NO_x react after they have been emitted to produce ground level ozone. The industry that this rezoning would provide for would produce large amounts of these emissions. This would make it even harder as Loudoun County tries to achieve attainment. As time goes on and the scientific research advances our knowledge and understanding of the extent to which gaseous, particulate and hazardous emissions affect human health the NAAQS standards are likely to be reduced. The effects on air emission from this rezoning will make it only harder for Loudoun and Northern Virginia to meet these standards.

In addition to the concerns about the air, the possible ground and surface water contamination is very concerning to Loudoun and Virginia residents. The site is known to have ground water that is vulnerable to contamination due to the karst hydrogeology. A USGS study demonstrated that the ground water adjacent to the site to be rezoned communicates readily with surface

water tributaries of the Potomac River. In addition to direct infiltration where water moves directly from the surface to groundwater via porous limestone bedrock, karst is known to have severe ground instability problems. This makes karst geology prone to sinkhole development. Sinkholes provide direct connection between the surface water and any contaminants it may contain and the groundwater. This makes the aquifer vulnerability in karst areas very high, and contamination with industrial activity such as that provided for by this rezoning too likely.

Loudoun sources its drinking water from the Potomac River, downstream of many West Virginia tributaries that carry water from the epikarst and groundwater aquifer at the site to be rezoned. Loudoun has recently completed the new Trap Rock Water Treatment facility, which draws water from the Potomac River. Loudoun currently provides 40 million gallons and projects to provide 90 million gallons of drinking water a day to customers by 2040 (Loudounwater.org). Therefore, the viability of the Potomac River is a high priority for Virginia residents.

Loudoun and Northern Virginia is one of the fastest growing communities in the country and provides a lot to Jefferson County in their symbiotic relationship. Virginia residents support and enjoy Jefferson County through tourism, as our residents enjoy the natural and historical resources of your county. Virginia residents and businesses support the equine industry in a multitude of ways from providing wagering fans at the races to the Virginia Breeders Association Virginia Certified incentive programs and a strong market for retired racehorses. According to an economic impact study from WVU, at least 40% of Jefferson County residents travel outside of West Virginia for work, a good percentage of those travel to northern Virginia. This rezoning would allow for industry that would negatively affect the economy of both places and this relationship and the benefits for our residents gleaned from it.

This zoning change will provide for industry that will negatively effect the health safety and welfare of the Loudon and Northern Virginia community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Luke Reichel

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Rockwool does not belong here, please read this and consider. Keep foreign polluting industry away from us!

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Furthermore, the area designated is protected by the National Park Service for its approximation to historical lands and tributaries. In addition, Maryland acts prohibit the contributions of contaminants to streams and tributaries linked to the Potomac River, that flow to the Chesapeake and Atlantic Ocean. Wildlife and human life will be forever altered and for some extinct and for all a shortened lifespan.

The Denmark industry and others you no doubt have planned for the are will not being significant jobs to the area, not will their profits be home based. The economic development you may wish us to believe to come from this outrageous plan is non existent. No one, but the manufacturers will benefit. The only reason they are coming here is to strip the land for resources and take advantage of very lax environmental protections in WV.

Any jobs during the build will cease upon completion.

Do NOT vote for the rezoning. To do so KILLS your family and mine, KILLS agriculture, KILLS an entire ecosystem pristine in natural habitat and history.

Sincerely,

Mary Gies

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would negatively affect tourism, economic agility, groundwater quality, and individual health in neighboring municipalities like Shepherdstown.

Tourism is critically important to Shepherdstown's economy and to the county as a whole. In 2018, tourist spending in the Jefferson County contributed over \$170 million to state and local government revenue and \$213 million in individual earnings. Importantly, most of this money comes from tourists visiting from neighboring states like Virginia, Maryland, and Washington D.C. Out-of-state tourists are largely drawn to Jefferson County because of its reputation for environmental-friendly, sustainable industry. Key elements that support this reputation include the county's pastoral scenery and pristine natural resources. Ordinance #2017-302 will allow industry into Jefferson County that risks harming these elements and dramatically reducing the area's appeal to visitors. The resulting harm to our tourist industry would drive away visitors and decrease state, county, and local revenue. The long-term success of Jefferson County's tourism industry is dependent on local governments making coordinated zoning decisions. Allowing certain types in industry in Ranson will negatively affect tourism in every municipality throughout the county, including Shepherdstown. Voting no on ordinance #2017-302 will protect the foundations of the county's tourism industry and protect the 7,040 jobs in Jefferson County that are directly supported by tourism.

The type of large, consolidated industry that ordinance #2017-302 would allow in Ranson would generally reduce the flexibility of local economies in Jefferson County. Historically, the driving industries in Jefferson County have been tourism, agriculture, and the equine industries. These three industries are large conglomerates of small businesses. Small business is very important to Sheherdstown. Small businesses have been shown to create more jobs, cultivate more innovation, and provide more opportunities than big, non-local firms. Additionally, small businesses have been shown to more reactive to sudden changes relative to manufacturing

businesses. Bringing large, manufacturing-based industry into Jefferson county will depress the local economy and stifle innovation. During this time of economic upheaval and uncertainty, Jefferson County needs to support industries that will allow local economies to adapt and recover as fast as possible.

Voting no on ordinance #2017-302 will help protect water resources throughout Jefferson County. The type of industry that ordinance #2017-302 would allow puts the ground resources of Jefferson county at significant risk due to the karst hydrogeology. The site in Ranson is in the Rocky Marsh Run watershed, which is in the source water protection zone for Shepherdstown and drains to the Potomac River. Therefore, activity at this site will affect both groundwater and surface water streams. In municipalities like Shepherdstown, many residents and nearby farms depend on wells for water. Contamination of groundwater aquifers would create both health and remediation concerns for local residents. Dye tests performed by the USGS near the area of proposed rezoning in Ranson have shown just how far-reaching groundwater contamination at the Ranson site could be. Results from the USGS study revealed measurable dye concentrations in Elk's Run, Rattlesnake Run, and even the Shepherdstown Town Run. This last run cuts through the center of Shepherdstown and is a favorite area for children to play and learn to fish.

Groundwater pollution is not the only concern for communities like Shepherdstown. The type of industry that ordinance #2017-302 would allow in Ranson would also generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. These pollutants are particularly harmful to children. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. The site in Ranson is across the road from an elementary school and also within the Jefferson High Middle district. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of children in Shepherdstown and all of Jefferson County.

I again request that you vote no on ordinance #2017-302. The long-term economic, environmental, and community health of municipalities like Shepherdstown depend on Ranson's participation in a coordinated zoning plan for all of Jefferson County.

PS. Please vote no. I live with my seventy year old mother in Shepherdstown. Our home is our investment for the future. Please don't let our property value plummet. We also live with my brother, who has allergy issues. Please don't make the air worse for him. I myself am living with brain tumors I got from drinking industry polluted water in my hometown of Parkersburg. Please don't poison my new home.

Thank you for your time.

Sincerely,

Elizabeth

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I am a native West Virginian who finally had to leave for health reasons. I had developed serious lung issues from decades of breathing polluted air, first from the chemical industry in Kanawha County and later in Morgantown, where fracking surrounded us. What a nightmare that now I live with my family in MD and my health will again be compromised by WV chemicals. The air you contaminate will not observe state lines. Please be accountable for the dangers you are posing for thousands of individuals by permitting dangerous pollutants to contaminate the region. Please do your job by accepting your responsibility for protecting us. Thank you.

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would have a negative effect on water and air quality in neighboring states such as Maryland. Our air quality in Maryland is already poor, due very much to West Virginia's irresponsible actions permitting pollutants to continue.

The Potomac River provides drinking water and a source of recreation to Maryland residents. Water and air pollution generated within the Potomac River's watershed will inevitably contaminate this valuable waterway. The site of the proposed zoning change in Ranson is located within the Potomac River Watershed.

The type of industry that ordinance #2017-30 would allow in Ranson would utilize large water impoundments, in an area of known karst terrain. This water will be contaminant from several sources including particulate mater that has fallen out from the air emissions and process water. The West Virginia Department of Environmental Protection has published guidelines that specifically discourage extensive development in areas of karst terrain because of the vulnerability of karst aquifers to contamination by surface pollution. Karst features increase surface water and groundwater connectivity and any spills or surface releases quickly percolate into the groundwater. Additionally, sinkholes are common in karst terrain and can cause

ruptures in wastewater impoundments. Even if appropriate attempts are made to contain and manage wastewater and other stormwater runoff on-site, there is still a high risk that wastewater could contaminate the groundwater through tears and catastrophic failure of wastewater impoundments. Contaminated groundwater in karst terrain can easily resurface in waterways several miles away, as shown by a USGS tracer study conducted near the site in to be rezoned. The USGS study detected tracer dye in multiple springs and waterways miles from the initial injection site in Ranson. All of these waterways drain into the Potomac River.

Mismanagement of wastewater could also lead to contamination of nearby surface waters. For example, the site of the proposed rezoning in Ranson is in the Rocky Marsh Run watershed. Rocky Marsh Run also drains to the Potomac River. Voting no on ordinance #2017-302 will preserve downstream water quality and help ensure that the Potomac River remains usable for Maryland residents.

Air pollution poses another risk to Maryland residents. The type of industry that ordinance #2017-302 would allow would generate air pollutants like fine particulate matter. According to the US EPA, fine particulates can travel 100s of miles from its original source. Air pollution related to industrial activity in Ranson could easily reach Maryland. Fine particulates have a greater affinity for carrying toxic compounds and their small size allows them to be inhaled more deeply into the lungs. Chronic exposure to fine particulate matter is associated with increased risk of several diseases including Alzheimer's in adults. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease among others. Fine particulate matter also exacerbates regional haze which creates a visible reminder of air pollution. The psychological effects that arise from an increased perception of pollution include stress, anxiety, and unhappiness. Voting no on ordinance #2017-302 will help prevent increased air pollution from negatively affecting the long-term health of Maryland residents.

I again request that you vote no on ordinance #2017-302. Zoning decisions in Ranson and Jefferson County have an undeniable influence on the quality of life in neighboring states.
Sincerely,

Ann Payne

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The city has failed to address the latter part of this objective. By Changing the SDI in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and child hood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health, and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and overall earnings for owners, breeders, and

trainers. This group provides over 70 million dollars in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. This industry would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitorship and again decreasing return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up this industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the Karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive plan is clear the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Shannon Hornich

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I have major concerns about the safety and well-being of generations to come due to this industry coming to the area. I lived in Huntington, WV also known as "chemical valley" for years and the health concerns for people in the area as well as the distinguished difference in air quality have led me to have concerns about Rockwool and anything like it coming to Jefferson County.

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would have a negative effect on water and air quality in neighboring states such as Maryland.

The Potomac River provides drinking water and a source of recreation to Maryland residents. Water and air pollution generated within the Potomac River's watershed will inevitably contaminate this valuable waterway. The site of the proposed zoning change in Ranson is located within the Potomac River Watershed.

The type of industry that ordinance #2017-30 would allow in Ranson would generate large quantities of wastewater, stored on-site, in an area of known karst terrain. The West Virginia Department of Environmental Protection has published guidelines that specifically discourage extensive development in areas of karst terrain because of the vulnerability of karst aquifers to contamination by surface pollution. Karst features increase surface water and groundwater connectivity and any spills or surface releases quickly percolate into the groundwater. Additionally, sinkholes are common in karst terrain and can cause ruptures in wastewater impoundments. Even if appropriate attempts are made to contain and manage wastewater and other stormwater runoff on-site, there is still a high risk that wastewater could contaminate the groundwater through tears and catastrophic failure of wastewater impoundments. Contaminated groundwater in karst terrain can easily resurface in waterways several miles away, as shown by a USGS tracer study conducted near the site in Ranson. The USGS study detected tracer dye in multiple springs and waterways miles from the initial injection site in Ranson. All of these waterways drain into the Potomac River.

Mismanagement of wastewater could also lead to contamination of nearby surface waters. For example, the site of the proposed rezoning in Ranson is in the Rocky Marsh Run watershed. Rocky Marsh Run also drains to the Potomac River. Voting no on ordinance #2017-30 will

preserve downstream water quality and ensure that the Potomac River remains usable for Maryland residents.

Air pollution poses another risk to Maryland residents. The type of industry that ordinance #2017-302 would allow would generate air pollutants like fine particulate matter. According to the US EPA, fine particulates can travel 100s of miles from its original source. Air pollution related to industrial activity in Ranson could easily reach Maryland. Fine particulates have a greater affinity for carrying toxic compounds and their small size allows them to be inhaled more deeply into the lungs. Chronic exposure to fine particulate matter is associated with increased risk of Alzheimer's in adults. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. Fine particulate matter also exacerbates regional haze which creates a visible reminder of air pollution. The psychological effects that arise from an increased perception of pollution include stress, anxiety, and unhappiness. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of Maryland residents.

I again request that you vote no on ordinance #2017-302. Zoning decisions in Ranson and Jefferson County have an undeniable influence on the quality of life in neighboring states.

Sincerely,

Mary Cramer

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The city has failed to address the latter part of this objective. By Changing the SDI in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and child hood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health, and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and overall earnings for owners, breeders, and

trainers. This group provides over 70 million dollars in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. This industry would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitorship and again decreasing return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up this industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the Karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive plan is clear the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Jacqueline Ras

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The original vision of the Jefferson Orchards property as mixed retail/residential was radically hijacked by bringing in heavy industry. This is a betrayal of the public welfare of our beautiful area. The process by which it was changed was not transparent at all. Most were not aware of these changes until they were already completed. Furthermore, this property is not even adjacent to the city of Ranson, making the whole process even more suspect. Who and what was behind this push to bring this heavy industry to our area?

In light of all this, it makes sense that this property not be zoned for heavy industry. Zoning it for heavy industry is not in the best interests of our beautiful and historic area.

Sincerely,

Richard Urban

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Now is the time to protect our environment for people as well as animals! Do we really want to add polluted water and air to our list of the world's woes at the moment?

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would have a negative effect on water and air quality in neighboring states such as Maryland.

The Potomac River provides drinking water and a source of recreation to Maryland residents. Water and air pollution generated within the Potomac River's watershed will inevitably contaminate this valuable waterway. The site of the proposed zoning change in Ranson is located within the Potomac River Watershed.

The type of industry that ordinance #2017-30 would allow in Ranson would utilize large water impoundments, in an area of known karst terrain. This water will be contaminant from several sources including particulate mater that has fallen out from the air emissions and process water. The West Virginia Department of Environmental Protection has published guidelines that specifically discourage extensive development in areas of karst terrain because of the vulnerability of karst aquifers to contamination by surface pollution. Karst features increase surface water and groundwater connectivity and any spills or surface releases quickly percolate into the groundwater. Additionally, sinkholes are common in karst terrain and can cause ruptures in wastewater impoundments. Even if appropriate attempts are made to contain and manage wastewater and other stormwater runoff on-site, there is still a high risk that wastewater could contaminate the groundwater through tears and catastrophic failure of wastewater impoundments. Contaminated groundwater in karst terrain can easily resurface in waterways several miles away, as shown by a USGS tracer study conducted near the site in to be rezoned. The USGS study detected tracer dye in multiple springs and waterways miles from the initial injection site in Ranson. All of these waterways drain into the Potomac River.

Mismanagement of wastewater could also lead to contamination of nearby surface waters. For example, the site of the proposed rezoning in Ranson is in the Rocky Marsh Run watershed. Rocky Marsh Run also drains to the Potomac River. Voting no on ordinance #2017-302 will preserve downstream water quality and help ensure that the Potomac River remains usable for Maryland residents.

Air pollution poses another risk to Maryland residents. The type of industry that ordinance #2017-302 would allow would generate air pollutants like fine particulate matter. According to the US EPA, fine particulates can travel 100s of miles from its original source. Air pollution related to industrial activity in Ranson could easily reach Maryland. Fine particulates have a greater affinity for carrying toxic compounds and their small size allows them to be inhaled more deeply into the lungs. Chronic exposure to fine particulate matter is associated with increased risk of several diseases including Alzheimer's in adults. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease among others. Fine particulate matter also exacerbates regional haze which creates a visible reminder of air pollution. The psychological effects that arise from an increased perception of pollution include stress, anxiety, and unhappiness. Voting no on ordinance #2017-302 will help prevent increased air pollution from negatively affecting the long-term health of Maryland residents.

I again request that you vote no on ordinance #2017-302. Zoning decisions in Ranson and Jefferson County have an undeniable influence on the quality of life in neighboring states.
Sincerely,

Carey Murphy

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I live across the Potomac from y'all. Your air becomes my air, and your water my water. Your decisions here affect my health and the health of my community.

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would have a negative effect on water and air quality in neighboring states such as Maryland.

The Potomac River provides drinking water and a source of recreation to Maryland residents. Water and air pollution generated within the Potomac River's watershed will inevitably contaminate this valuable waterway. The site of the proposed zoning change in Ranson is located within the Potomac River Watershed.

The type of industry that ordinance #2017-30 would allow in Ranson would utilize large water impoundments, in an area of known karst terrain. This water will be contaminant from several sources including particulate mater that has fallen out from the air emissions and process water. The West Virginia Department of Environmental Protection has published guidelines that specifically discourage extensive development in areas of karst terrain because of the vulnerability of karst aquifers to contamination by surface pollution. Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would negatively affect tourism, economic agility, groundwater quality, and individual health in neighboring municipalities like Shepherdstown.

Tourism is critically important to Shepherdstown's economy and to the county as a whole. In 2018, tourist spending in the Jefferson County contributed over \$170 million to state and local government revenue and \$213 million in individual earnings. Importantly, most of this money comes from tourists visiting from neighboring states like Virginia, Maryland, and Washington D.C. Out-of-state tourists are largely drawn to Jefferson County because of its reputation for environmental-friendly, sustainable industry. Key elements that support this reputation include the county's pastoral scenery and pristine natural resources. Ordinance #2017-302 will allow industry into Jefferson County that risks harming these elements and dramatically reducing the area's appeal to visitors. The resulting harm to our tourist industry would drive away visitors and decrease state, county, and local revenue. The long-term success of Jefferson County's tourism industry is dependent on local governments making coordinated zoning decisions. Allowing certain types in industry in Ranson will negatively affect tourism in every municipality throughout the county, including Shepherdstown. Voting no on ordinance #2017-302 will protect the foundations of the county's tourism industry and protect the 7,040 jobs in Jefferson County that are directly supported by tourism.

The type of large, consolidated industry that ordinance #2017-302 would allow in Ranson would generally reduce the flexibility of local economies in Jefferson County. Historically, the driving industries in Jefferson County have been tourism, agriculture, and the equine industries. These three industries are large conglomerates of small businesses. Small business is very important to Sheherdstown. Small businesses have been shown to create more jobs, cultivate more innovation, and provide more opportunities than big, non-local firms. Additionally, small businesses have been shown to more reactive to sudden changes relative to manufacturing

businesses. Bringing large, manufacturing-based industry into Jefferson county will depress the local economy and stifle innovation. During this time of economic upheaval and uncertainty, Jefferson County needs to support industries that will allow local economies to adapt and recover as fast as possible.

Voting no on ordinance #2017-302 will help protect water resources throughout Jefferson County. The type of industry that ordinance #2017-302 would allow puts the ground resources of Jefferson county at significant risk due to the karst hydrogeology. The site in Ranson is in the Rocky Marsh Run watershed, which is in the source water protection zone for Shepherdstown and drains to the Potomac River. Therefore, activity at this site will affect both groundwater and surface water streams. In municipalities like Shepherdstown, many residents and nearby farms depend on wells for water. Contamination of groundwater aquifers would create both health and remediation concerns for local residents. Dye tests performed by the USGS near the area of proposed rezoning in Ranson have shown just how far-reaching groundwater contamination at the Ranson site could be. Results from the USGS study revealed measurable dye concentrations in Elk's Run, Rattlesnake Run, and even the Shepherdstown Town Run. This last run cuts through the center of Shepherdstown and is a favorite area for children to play and learn to fish.

Groundwater pollution is not the only concern for communities like Shepherdstown. The type of industry that ordinance #2017-302 would allow in Ranson would also generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. These pollutants are particularly harmful to children. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. The site in Ranson is across the road from an elementary school and also within the Jefferson High Middle district. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of children in Shepherdstown and all of Jefferson County.

I again request that you vote no on ordinance #2017-302. The long-term economic, environmental, and community health of municipalities like Shepherdstown depend on Ranson's participation in a coordinated zoning plan for all of Jefferson County.

Sincerely,

Kelly Pannill-Perkins
Charles Town, 25414

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

This zoning change will provide for industry that will negatively affect the agriculture industry in Jefferson County and beyond. The combination of the air emissions and threat to the ground water resources could have devastating consequences for the agricultural community of Jefferson County.

The agriculture industry in Jefferson County is hundreds of years old and continues to serve our community well today. According to the economic impact study "A Shared Agenda for Growing West Virginia's Agricultural Economy, Prepared by Fourth Economy for West Virginia Department Of Agriculture West Virginia University Extension Service 2012," Jefferson County is the second highest producing county for crops sales, third highest for fruits and vegetables sales, and in the top 9 counties for sales of animals and animal products.

Agriculture, tourism and the equine industries work synergistically to have an outsized positive impact on the economy in Ranson and Jefferson County as a whole. Agriculture drives tourism by creating agro-tourism opportunities, preserving beautiful open spaces that contribute to the bucolic nature of our county, and providing the locally produced agriculture goods many tourists are look for in our markets and restaurants. Agriculture also supports the equine industry by providing local products like hay and straw, helping maintain pasture land, co-supporting local dual-purpose retail stores, and helping recycle by products. Agriculture helps maintain the way of life that many those who choose to live in Jefferson County enjoy. Industrial manufacturing and industry this zoning will provide for could never achieve these things.

Local agriculture also provides a source of locally produced agricultural goods. It has become apparent with the current pandemic and health emergency. This became a supply chain crisis because as our supply chains have moved to be ever more lean and efficient they lack resiliency and agility. By having a local source of agricultural goods and food we add resiliency and agility

into our own economy and community. The agricultural industry in Jefferson County provides this.

A plethora of scientific studies have shown that a variety of air pollutants produced by the type of industry this zoning change would provide for causes decreased yields of both quantity and quality for several of the crops important to Jefferson County including winter wheat and soybeans. Soybeans and wheat are two of the crops significantly affected and two of the most prevalent crops in Jefferson County. Lower crop yields harm the farms and all the members of the down stream supply chain as well as the consumer.

Recent studies have shown that even small increases in air pollution affect the productivity of agricultural workers. Similar to the reduction in crop yield this will negatively affect the individual workers, businesses, consumers and industry as a whole.

Even more devastating is the possibility of groundwater contamination. The land at the subject location has karst hydrogeology and as such has porous bedrock and severe ground instability problems. The porous bedrock allows rapid diffuse infiltration of surface water into ground water and the severe ground instability problems leads to sinkhole development. Sinkholes provide direct connection of the surface water with the ground water aquifer through point infiltration. In fact, according to a 2012 study by Doctor and Doctor, the subject location and that of Terrapins Neck have the highest sinkhole vulnerability of any sites in Jefferson County. The propensity and easy of diffuse and point infiltration in areas of karst hydrogeology give them very high aquifer vulnerability meaning the aquifer is very vulnerable to contamination. For this reason, this measure has been used for decades by policymakers to set land use regulations.

The WVDEP recognizes development in car karst areas puts water resources high-risk for contamination but also recognizes that this is best protected against true local land use and zoning ordinances. WVDEP's guiding document *Stormwater Management Design in Karst Areas* states, "it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." This document also references the Chesapeake Bay Stormwater Network karst stormwater guidance document the *CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed*. In which it states "...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." Land use policy in Ranson and zoning need to take aquifer vulnerability into consideration as these agencies and documents suggest.

The Jefferson Orchards Voluntary Remediation Plan application reports that the ground water is only 60 feet from the surface at the site. It is described in the scientific literature that this land is an upland plane with large amounts of water in the epikarst, and contamination of this

water effects the whole aquifer including the communications with surface water streams. A USGS study demonstrated that the groundwater adjacent to the site communicates readily with several surface water structures and wells miles away from the site. The effects of contamination at this site would go well beyond Ranson fouling large portions of the ground water and surface water in Jefferson County.

Groundwater contamination at the site would have devastating effects on the Agricultural industry in Jefferson county. For geographic and economic reasons it is simply infeasible for the agricultural industry to rely on utility provided water. Based on the scientific literature the site being considered for rezoning is one of the areas of highest aquifer vulnerability in Jefferson County and is inappropriate for the industry that this zoning change will provide for.

By threatening the local agricultural industry, the industry that this zoning will provide for will threaten the health, safety, and welfare of the community. The Comprehensive Plan in Ranson is clear the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Ashley Viands

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The city has failed to address the latter part of this objective. By Changing the SDI in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and child hood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health, and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and overall earnings for owners, breeders, and

trainers. This group provides over 70 million dollars in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. This industry would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitorship and again decreasing return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up this industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the Karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive plan is clear the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Jack Eggleston

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask you to vote NO on Ordinance #2017-302. The industry this zoning change will allow for endangers the health, safety and, welfare of the community, and violates the premise of the smart code zoning that we have spent so much time, effort and federal money employing.

Any change in zoning needs to align with the comprehensive plan. In Ranson's current comprehensive plan (2012), the City only refers to "heavy industry" in the history section. Here it is characterized as part of a bygone era that has been replaced by an emphasis on agriculture for local food production, open spaces, and quality-of-life. In the remainder of the document, the word industry is used loosely to describe businesses including flower shops and shoe stores. Nothing that resembles the industry that this zoning change will provide for is described in the current comprehensive plan of Ranson.

In the land use section of the comprehensive plan, number ten states:

"Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The comprehensive plan clearly states that the city will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community. This change in zoning clearly negatively affects the health, safety, and welfare of the community.

As the zoning is proposed, the industry that this zoning change will allow for will be directly across the street from houses, parks and other small businesses. A densely populated subdivision and an elementary school already exit directly across the street. While these latter

community sections are not in the city limits, the effect of this zoning on them should still be considered just the same as it would be if they were in the city limits.

The industry that this zoning change will provide for will produce particulate, gaseous, and hazardous air emissions. These emissions have been shown to be detrimental to human health at every stage of life from embryo to old age. In utero and childhood exposure are the most damaging with lasting effects being realized through out life, and with maternal exposure the effects can be felt for generations. Multiple organ systems are affected including respiratory, cardiovascular, neurologic, immune, and endocrine causing defects in multiple processes including in utero development, neurodevelopment, immune and tolerance development, and cognitive defects. There are also psychological, social, and economic effects from both perceived and actual air pollution in both children and adults. Many of these effects can be seen even with short-term exposure or exposure that is lower than the levels recommended by the US Environmental Protection Agency and World Health Organization. These consequences are devastating to the individual and depressing to the local community and economy. State law does not allow a school to be built next to industry that this zoning will allow but yet we are contemplating changing the zoning so this industry can build next to a school. This does not make sense. As Ranson residents, we want Ranson to follow the lead of the state and keep polluting industry away from kids. In these ways, this change in zoning will negatively affect the health and welfare of the community.

In addition to the health effects of the air emissions is the threat to groundwater from the industry that this zoning change would allow. The land in question has karst hydrogeology and therefore very high aquifer vulnerability and is not appropriate for this industry. With the type of industry this zoning will provide for, combined with high aquifer vulnerability, the likelihood of groundwater contamination is too high for the community and region to bear. A USGS study demonstrated that contamination in the groundwater adjacent to the site moves relatively quickly and can be found in wells and surface water structures in a variety of locations in the County. In this way, contamination at the site would affect the drinking water of the great majority of Jefferson County residents. Through the surface water connections, the water at the site also affects the water resources of the region.

Aquifer vulnerability has been used by policy makers for decades to set land use regulations. The guiding document, from the WVDEP, *Stormwater Management Design in Karst Areas* states, "it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." In Ranson, we need to follow this advice and not change the zoning of this land for use by industry that has among the highest aquifer vulnerability in the County. This zoning change will endanger the safety of the community and region by endangering the safe water resources. As Ranson residents, we want to safeguard the water resources of the county and region by following the WVDEP guidance here.

Further, by reallocating this transect district and replacing it with a monolithic block of Special District Industrial designation, hundreds of housing units, parks and space for small businesses are lost. Ranson loses the potential for property tax on these properties and their improvements, Business and Occupational tax on the businesses and sales tax in retail stores. The community loses out on the opportunity to develop affordable housing and create locations where people can live, work, play, and shop all in the same place reducing the need for travel.

Worse yet apparently a deal has been made where the entity that owns the subject land has required that a litany of things not be built on the adjacent land essentially stripping the purpose of the smart code transect zone that exists there. Transect zones in the smart code are meant to transition, from out to in, and provide communities where people can safely work and live in close proximity in an effort to reduce travel. Excluding many of the components of the transect zone effectively eliminates the features that make it a transect zone, thus, losing the benefits a transect zone offers the community and city. By losing these benefits, reducing the overall and affordable housing prospects, and reducing so drastically the opportunities for city income, this zoning change will negatively affect the welfare of the community.

As Ranson residents, we find it odd that we are changing zoning to provide for industry that we would not put in the middle of our town close to our residents, but we are placing it close to the homes of county residents. Further, it is striking that the area where this change in zoning is directly adjacent to historically underserved lower income communities and a Title I school. This amounts to environmental injustice and cannot be tolerated.

The purpose of zoning is for a city to protect the health, welfare, morals and safety of the community. In this case, the air emissions and heavy truck traffic will endanger the communities' health. The threat of water contamination will endanger the safety of the community. The effect of lost productivity and decreased workforce participation due to increased illness and the negative effect the air emissions and presence of such a factory will have on the local economy will negatively affect the welfare of the community. The environmental injustice of changing the zoning to accommodate such polluting industry in a location where your municipality has no residents, but yet hundreds of low income and underserved county residents live is egregiously amoral. This must not happen. We respectfully implore you to do the right thing and vote no on ordinance #2017-302.

Sincerely,

Julie Allen

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The city has failed to address the latter part of this objective. By Changing the SDI in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and child hood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health, and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and overall earnings for owners, breeders, and

trainers. This group provides over 70 million dollars in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. This industry would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitorship and again decreasing return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up this industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the Karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive plan is clear the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Brandon Darr

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The city has failed to address the latter part of this objective. By Changing the SDI in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and child hood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health, and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and overall earnings for owners, breeders, and

trainers. This group provides over 70 million dollars in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. This industry would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitorship and again decreasing return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up this industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the Karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive plan is clear the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Gregory Stefano

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I am a long-time resident of Jefferson County and my family has been living in the eastern panhandle since the 1730's. While I have left the region for education and job transfers over the years, I always find myself drawn back to this area where my soul is at peace. I have raised my children here. This community supported me and my then 4 and 12 year old children in the dark days after my husband died of an environmentally derived cancer. I hope to live out my life here surrounded by friends and family and, when the time comes, lay my bones to rest beside generations of my family in the good earth of the eastern panhandle. But that will not be possible if our air, water and livelihoods become yet another sacrifice zone for industrial pollution. I fully support smart economic growth and that path forward has been laid out for us through careful research and planning. Please do not throw all of that away. Please do not destroy our lives. I respectfully request and implore you to choose the better path and vote no on ordinance #2017-302.

The type of industry that this ordinance would allow in Ranson would negatively affect tourism, economic agility, groundwater quality, and individual health in neighboring municipalities like Shepherdstown.

Tourism is critically important to Shepherdstown's economy and to the county as a whole. In 2018, tourist spending in the Jefferson County contributed over \$170 million to state and local government revenue and \$213 million in individual earnings. Importantly, most of this money comes from tourists visiting from neighboring states like Virginia, Maryland, and Washington D.C. Out-of-state tourists are largely drawn to Jefferson County because of its reputation for environmental-friendly, sustainable industry. Key elements that support this reputation include the county's pastoral scenery and pristine natural resources. Ordinance #2017-302 will allow industry into Jefferson County that risks harming these elements and dramatically reducing the area's appeal to visitors. The resulting harm to our tourist industry would drive away visitors and decrease state, county, and local revenue. The long-term success of Jefferson County's

tourism industry is dependent on local governments making coordinated zoning decisions. Allowing certain types in industry in Ranson will negatively affect tourism in every municipality throughout the county, including Shepherdstown. Voting no on ordinance #2017-302 will protect the foundations of the county's tourism industry and protect the 7,040 jobs in Jefferson County that are directly supported by tourism.

The type of large, consolidated industry that ordinance #2017-302 would allow in Ranson would generally reduce the flexibility of local economies in Jefferson County. Historically, the driving industries in Jefferson County have been tourism, agriculture, and the equine industries. These three industries are large conglomerates of small businesses. Small business is very important to Sheherdstown. Small businesses have been shown to create more jobs, cultivate more innovation, and provide more opportunities than big, non-local firms. Additionally, small businesses have been shown to more reactive to sudden changes relative to manufacturing businesses. Bringing large, manufacturing-based industry into Jefferson county will depress the local economy and stifle innovation. During this time of economic upheaval and uncertainty, Jefferson County needs to support industries that will allow local economies to adapt and recover as fast as possible.

Voting no on ordinance #2017-302 will help protect water resources throughout Jefferson County. The type of industry that ordinance #2017-302 would allow puts the ground resources of Jefferson county at significant risk due to the karst hydrogeology. The site in Ranson is in the Rocky Marsh Run watershed, which is in the source water protection zone for Shepherdstown and drains to the Potomac River. Therefore, activity at this site will affect both groundwater and surface water streams. In municipalities like Shepherdstown, many residents and nearby farms depend on wells for water. Contamination of groundwater aquifers would create both health and remediation concerns for local residents. Dye tests performed by the USGS near the area of proposed rezoning in Ranson have shown just how far-reaching groundwater contamination at the Ranson site could be. Results from the USGS study revealed measurable dye concentrations in Elk's Run, Rattlesnake Run, and even the Shepherdstown Town Run. This last run cuts through the center of Shepherdstown and is a favorite area for children to play and learn to fish.

Groundwater pollution is not the only concern for communities like Shepherdstown. The type of industry that ordinance #2017-302 would allow in Ranson would also generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. These pollutants are particularly harmful to children. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. The site in Ranson is across the road from an elementary school and also within the Jefferson High Middle district. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of children in Shepherdstown and all of Jefferson County.

I again request that you vote no on ordinance #2017-302. The long-term economic, environmental, and community health of municipalities like Shepherdstown depend on Ranson's participation in a coordinated zoning plan for all of Jefferson County.

Sincerely,

Elizabeth Cauvel

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would have a negative effect on water and air quality in neighboring states such as Maryland.

The Potomac River provides drinking water and a source of recreation to Maryland residents. Water and air pollution generated within the Potomac River's watershed will inevitably contaminate this valuable waterway. The site of the proposed zoning change in Ranson is located within the Potomac River Watershed.

The type of industry that ordinance #2017-30 would allow in Ranson would generate large quantities of wastewater, stored on-site, in an area of known karst terrain. The West Virginia Department of Environmental Protection has published guidelines that specifically discourage extensive development in areas of karst terrain because of the vulnerability of karst aquifers to contamination by surface pollution. Karst features increase surface water and groundwater connectivity and any spills or surface releases quickly percolate into the groundwater. Additionally, sinkholes are common in karst terrain and can cause ruptures in wastewater impoundments. Even if appropriate attempts are made to contain and manage wastewater and other stormwater runoff on-site, there is still a high risk that wastewater could contaminate the groundwater through tears and catastrophic failure of wastewater impoundments. Contaminated groundwater in karst terrain can easily resurface in waterways several miles away, as shown by a USGS tracer study conducted near the site in Ranson. The USGS study detected tracer dye in multiple springs and waterways miles from the initial injection site in Ranson. All of these waterways drain into the Potomac River.

Mismanagement of wastewater could also lead to contamination of nearby surface waters. For example, the site of the proposed rezoning in Ranson is in the Rocky Marsh Run watershed. Rocky Marsh Run also drains to the Potomac River. Voting no on ordinance #2017-30 will

preserve downstream water quality and ensure that the Potomac River remains usable for Maryland residents.

Air pollution poses another risk to Maryland residents. The type of industry that ordinance #2017-302 would allow would generate air pollutants like fine particulate matter. According to the US EPA, fine particulates can travel 100s of miles from its original source. Air pollution related to industrial activity in Ranson could easily reach Maryland. Fine particulates have a greater affinity for carrying toxic compounds and their small size allows them to be inhaled more deeply into the lungs. Chronic exposure to fine particulate matter is associated with increased risk of Alzheimer's in adults. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. Fine particulate matter also exacerbates regional haze which creates a visible reminder of air pollution. The psychological effects that arise from an increased perception of pollution include stress, anxiety, and unhappiness. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of Maryland residents.

I again request that you vote no on ordinance #2017-302. Zoning decisions in Ranson and Jefferson County have an undeniable influence on the quality of life in neighboring states.

Sincerely,

Laura Thorpe

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The city has failed to address the latter part of this objective. By Changing the SDI in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and child hood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health, and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and overall earnings for owners, breeders, and

trainers. This group provides over 70 million dollars in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. This industry would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitorship and again decreasing return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up this industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the Karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive plan is clear the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Carolyn Williams

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on #2017-302. The air emissions, possibility of ground and surface water contamination, and their effect on our interwoven economies threaten the health, safety and welfare of not just Jefferson County but the greater region, including Loudoun and the greater Northern Virginia area.

This zoning would provide for industry that produces large amounts of air emissions. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. Northern Virginia is directly downwind from these emissions. Much of the gaseous, fine particulate, and hazardous emissions can reach Northern Virginia. Further affecting the outdoor air quality of the adjacent portion of Virginia and the ability of these areas to achieve and maintain National Ambient Air Quality Standards (NAAQS) attainment. This will affect agriculture and outdoor leisure and recreation.

For example, Loudoun County has been in nonattainment for the NAAQS 8-hour Ozone standard for the past two years. VOC and NO_x react after they have been emitted to produce ground level ozone. The industry that this rezoning would provide for would produce large amounts of these emissions. This would make it even harder as Loudoun County tries to achieve attainment. As time goes on and the scientific research advances our knowledge and understanding of the extent to which gaseous, particulate and hazardous emissions affect human health the NAAQS standards are likely to be reduced. The effects on air emission from this rezoning will make it only harder for Loudoun and Northern Virginia to meet these standards.

In addition to the concerns about the air, the possible ground and surface water contamination is very concerning to Loudoun and Virginia residents. The site is known to have ground water that is vulnerable to contamination due to the karst hydrogeology. A USGS study demonstrated that the ground water adjacent to the site to be rezoned communicates readily with surface

water tributaries of the Potomac River. In addition to direct infiltration where water moves directly from the surface to groundwater via porous limestone bedrock, karst is known to have severe ground instability problems. This makes karst geology prone to sinkhole development. Sinkholes provide direct connection between the surface water and any contaminants it may contain and the groundwater. This makes the aquifer vulnerability in karst areas very high, and contamination with industrial activity such as that provided for by this rezoning too likely.

Loudoun sources its drinking water from the Potomac River, downstream of many West Virginia tributaries that carry water from the epikarst and groundwater aquifer at the site to be rezoned. Loudoun has recently completed the new Trap Rock Water Treatment facility, which draws water from the Potomac River. Loudoun currently provides 40 million gallons and projects to provide 90 million gallons of drinking water a day to customers by 2040 (Loudounwater.org). Therefore, the viability of the Potomac River is a high priority for Virginia residents.

Loudoun and Northern Virginia is one of the fastest growing communities in the country and provides a lot to Jefferson County in their symbiotic relationship. Virginia residents support and enjoy Jefferson County through tourism, as our residents enjoy the natural and historical resources of your county. Virginia residents and businesses support the equine industry in a multitude of ways from providing wagering fans at the races to the Virginia Breeders Association Virginia Certified incentive programs and a strong market for retired racehorses. According to an economic impact study from WVU, at least 40% of Jefferson County residents travel outside of West Virginia for work, a good percentage of those travel to northern Virginia. This rezoning would allow for industry that would negatively affect the economy of both places and this relationship and the benefits for our residents gleaned from it.

This zoning change will provide for industry that will negatively effect the health safety and welfare of the Loudon and Northern Virginia community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Tamara Reynolds

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The city has failed to address the latter part of this objective. By Changing the SDI in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and child hood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health, and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and overall earnings for owners, breeders, and

trainers. This group provides over 70 million dollars in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. This industry would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitorship and again decreasing return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up this industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the Karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive plan is clear the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Ralph Doty

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that will significantly harm the municipalities within Jefferson County and beyond effecting the health, welfare, and safety of our community. Harpers Ferry is a national treasure with the natural and historic resources tours flock to see each year and one of the communities that will be negatively impacted by this zoning change.

According to a 2019 study by the West Virginia Tourism Office, Jefferson County generated and average of \$178 million per year in tourism-derived revenue for state and local governments over the last 10 years, more than any other county in West Virginia by at least double. Tourism benefits the businesses and economy of Ranson and Jefferson County producing \$213.7 million in individual earning, 7040 jobs, and \$842.6 million in direct spending here in 2018. We would need 40 Project Shuttles to replace the individual earnings and 59 Rockwools to replace the jobs provided by the tourism industry in Jefferson County. It is important to note that most of the money generated by tourism in Jefferson County comes from neighboring states. In this way it is like an export. Not simply recycling money but bringing money into the state increasing its wealth. Much of the economy in Harpers Ferry is based on this tourism industry. A threat to this industry poses a threat to the economy and welfare of our community.

One of the important drivers for tourism in Harpers Ferry is the Appalachian Trail. According to the Appalachian Trail Conservancy (ATC), Harpers Ferry is the psychologic midpoint of the Trail, and Hikers often plan extended stays in Jefferson County with an obvious positive impact. The ATC reports that the smokestacks and associated lights will be visible in the view shed of 15 vistas on the Appalachian Trail (AT). Studies have shown that quality of vistas and human impact on the environment are not only noticed by visitors but effect their experience. Another study published in the Journal of Applied Recreation Research, found that points of interests and views drew visitors' attention and had a significant impact on their perception of the trail. It was also found that particularly beautiful vistas helped visitors overlook elements that usually

have a negative effect on trail experience like increased trail traffic. A 2009 study in Leisure Sciences revealed that scenic value was a perceptual theme of Appalachian Trail visitors, and that things as simple as dead trees visible in a vista can have a negative impact on visitors overall perception. Imagine the effect the smokestacks will have from the 15 vistas from which they will be visible. The introduction of industrial activity made possible by the proposed rezoning in Ranson would have a negative effect on the scenic views of beautiful landscapes from the Appalachian Trail in Jefferson County.

The smokestacks are not all visitors will be able to see, the air pollution will create haze. The effect of regional haze on tourists was explored in a review article published in the *Atmospheric Environment* titled "Impaired visibility: the air pollution people see." A key takeaway on the negative affect of haze on vacationing tourists was summarized as follows: "Vacations offer an escape from the routine and stress of our daily lives. Vacation destinations are often chosen based on their scenery; vacations are spent gazing at monuments, mountains, clouds, and oceans. Good visibility allows clear observation of distant features and appreciation of the inherent beauty of these scenes...Air pollution, which is often present in both our cities and parks, interferes with these attributes and can ruin the views vacationers travel to enjoy." People seek bucolic, unspoiled areas to escape the stresses of urban areas. A 2004 study in *Environment and Behavior* found Perceived pollution causes stress while viewing natural scenes has both psychological and physiological benefits, and a 2007 study confirmed these benefits. Two other studies found that people are emotionally affected by poor visibility, and tourists are disappointed when views are obscured by haze. The combination of smokestacks and haze will mar the viewshed and will not only reduce the positive effects of a scenic landscape but also leave tourists disappointed and dissatisfied with their choice of destination. With these effects the welfare of the Harpers Ferry community would undoubtedly be endangered by the industry that this zoning change will provide for.

Multiple studies by doctors Kozar, Doctor, and Doctor have demonstrated that the land at this site to be rezoned is Karst with the highest likelihood of sinkhole development in the county, and that the ground water aquifer there is incredibly sensitive to contamination from surface water. Further, this site is on an upland plain with relatively few surface streams, seasonal variability in the water table that results in numerous estavelles, and large amounts of water in the epikarst. In this area contamination in surface water communicates easily to the water in the epikarst via diffuse and point infiltration, and the springs at the margins of the upland area are directly affected by the water quality throughout the aquifer. According to Jefferson Orchards Voluntary Remediation Plan with the WVDEP, the ground water at the site is approximately 60 feet below the ground, and die tests performed by the USGS have shown that ground water from just adjacent to this site emerged in the headwaters of both the Elk's Run and Rattlesnake Run. This is critically important for Harpers Ferry because the Elk's Run headwaters is a spring about three miles south east of the site and goes on to become the drinking water source for Harpers Ferry and Bolivar before emptying into the Potomac River. The headwaters of Rattlesnake Run is a spring about 3.5 miles from the site and is also a tributary of the Potomac River. The Potomac River is the back up water source for Harpers Ferry. This means that the activity at the site will have a critical influence on the drinking water

of Harpers Ferry. In this was the industry permitted by this change in zoning would undoubtedly endanger the health and safety of the community in Harpers Ferry.

The untoward health effects and individual economic consequences from the pollution emissions of the industry this rezoning will allow that will be born out over the length of peoples lives and that of their decedents for at least 3 generations is an egregious example of environmental injustice that should not be tolerated. This zoning change may be in one of the poorest sections of the county but the effects will be felt in every part of Ranson and the county.

The Comprehensive plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” The industry that this rezoning will allow will jeopardize the health, safety and welfare of Ranson, Harpers Ferry and the whole county. Please vote no on the ordinance #2017-302.

Sincerely,

Candice Salter

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302. As a Jefferson County resident and long time home owner, I STRONGLY OPPOSE ordinance #2017-302.

Sincerely,

April Allmond

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

It has been a huge disappointment to me that the City of Ranson chose to invalidate the Mixed Use Concept Plan which would have provided a train station, housing and light industry. This was one of the attractions for an elderly person like me. I had hoped to occupy housing in this proposed village.

My sole reason for leaving the Kanawha Valley, the place where I was born, was the 2008 chemical explosion at the Bayer plant. The explosion took place while the methyl isocyanate mixer was being restarted. The process being contemplated by Rockwool is eerily similar to what happened in Charleston. I am distressed to think that the same thing will eventually happen with Rockwool.

- Rockwool is a threat to our health. It is disgraceful that this level of carcinogens would be placed next to Title 1 schools. How is it that we cannot locate a school next to a polluting plant but we locate a polluting plant next to schools and daycare centers. There is no safe level of exposure to carcinogens.
- Rockwool is a threat to our successful economy. Jefferson County has the lowest unemployment numbers in WV. We don't need these jobs which will damage our tourism, agricultural and equine industries.
- When the Rockwool's air permit was revealed, I was shocked and concerned about the poisoning of our air. After I educated myself about our karst terrain in this area, I became even more concerned about the pollution of our drinking water. We cannot survive without clean water. Having seen the poisoning of water in the coalfields and the sickness it brought to citizens, I'm not willing to take a chance on this threat to our water supply. Citizens in Southern WV were SLOWLY poisoned; however, because of the unique vulnerability of our karst terrain, citizens in the Eastern Panhandle can be QUICKLY poisoned.

- Rockwool was brought to our area (under the guise of Project Shuttle) and Eastern Panhandle citizens are very resentful. There can be no peace in our Shenandoah Valley and Rockwool will never be welcome here.

Please vote NO on this attempted rezoning action.

Regina Hendrix, 65 Bradford Court, Charles Town, WV (304) 725-0223", "", ""
 "", "10", "", "April ", "Allmond", "allmond@mac.com", "", "Harpers Ferry", "", "25425", "", "", "2020-06-16 11:46:54", "", "1", "Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect

visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that will significantly harm the municipalities within Jefferson County and beyond effecting the health, welfare, and safety of our community. Harpers Ferry is a national treasure with the natural and historic resources tours flock to see each year and one of the communities that will be negatively impacted by this zoning change.

According to a 2019 study by the West Virginia Tourism Office, Jefferson County generated and average of \$178 million per year in tourism-derived revenue for state and local governments over the last 10 years, more than any other county in West Virginia by at least double. Tourism benefits the businesses and economy of Ranson and Jefferson County producing \$213.7 million in individual earning, 7040 jobs, and \$842.6 million in direct spending here in 2018. We would need 40 Project Shuttles to replace the individual earnings and 59 Rockwools to replace the jobs provided by the tourism industry in Jefferson County. It is important to note that most of the money generated by tourism in Jefferson County comes from neighboring states. In this way it is like an export. Not simply recycling money but bringing money into the state increasing its wealth. Much of the economy in Harpers Ferry is based on this tourism industry. A threat to this industry poses a threat to the economy and welfare of our community.

One of the important drivers for tourism in Harpers Ferry is the Appalachian Trail. According to the Appalachian Trail Conservancy (ATC), Harpers Ferry is the psychologic midpoint of the Trail, and Hikers often plan extended stays in Jefferson County with an obvious positive impact. The ATC reports that the smokestacks and associated lights will be visible in the view shed of 15 vistas on the Appalachian Trail (AT). Studies have shown that quality of vistas and human impact on the environment are not only noticed by visitors but effect their experience. Another study published in the Journal of Applied Recreation Research, found that points of interests and views drew visitors' attention and had a significant impact on their perception of the trail. It was also found that particularly beautiful vistas helped visitors overlook elements that usually

have a negative effect on trail experience like increased trail traffic. A 2009 study in Leisure Sciences revealed that scenic value was a perceptual theme of Appalachian Trail visitors, and that things as simple as dead trees visible in a vista can have a negative impact on visitors overall perception. Imagine the effect the smokestacks will have from the 15 vistas from which they will be visible. The introduction of industrial activity made possible by the proposed rezoning in Ranson would have a negative effect on the scenic views of beautiful landscapes from the Appalachian Trail in Jefferson County.

The smokestacks are not all visitors will be able to see, the air pollution will create haze. The effect of regional haze on tourists was explored in a review article published in the *Atmospheric Environment* titled "Impaired visibility: the air pollution people see." A key takeaway on the negative affect of haze on vacationing tourists was summarized as follows: "Vacations offer an escape from the routine and stress of our daily lives. Vacation destinations are often chosen based on their scenery; vacations are spent gazing at monuments, mountains, clouds, and oceans. Good visibility allows clear observation of distant features and appreciation of the inherent beauty of these scenes...Air pollution, which is often present in both our cities and parks, interferes with these attributes and can ruin the views vacationers travel to enjoy." People seek bucolic, unspoiled areas to escape the stresses of urban areas. A 2004 study in *Environment and Behavior* found Perceived pollution causes stress while viewing natural scenes has both psychological and physiological benefits, and a 2007 study confirmed these benefits. Two other studies found that people are emotionally affected by poor visibility, and tourists are disappointed when views are obscured by haze. The combination of smokestacks and haze will mar the viewshed and will not only reduce the positive effects of a scenic landscape but also leave tourists disappointed and dissatisfied with their choice of destination. With these effects the welfare of the Harpers Ferry community would undoubtedly be endangered by the industry that this zoning change will provide for.

Multiple studies by doctors Kozar, Doctor, and Doctor have demonstrated that the land at this site to be rezoned is Karst with the highest likelihood of sinkhole development in the county, and that the ground water aquifer there is incredibly sensitive to contamination from surface water. Further, this site is on an upland plain with relatively few surface streams, seasonal variability in the water table that results in numerous estavelles, and large amounts of water in the epikarst. In this area contamination in surface water communicates easily to the water in the epikarst via diffuse and point infiltration, and the springs at the margins of the upland area are directly affected by the water quality throughout the aquifer. According to Jefferson Orchards Voluntary Remediation Plan with the WVDEP, the ground water at the site is approximately 60 feet below the ground, and the tests performed by the USGS have shown that ground water from just adjacent to this site emerged in the headwaters of both the Elk's Run and Rattlesnake Run. This is critically important for Harpers Ferry because the Elk's Run headwaters is a spring about three miles south east of the site and goes on to become the drinking water source for Harpers Ferry and Bolivar before emptying into the Potomac River. The headwaters of Rattlesnake Run is a spring about 3.5 miles from the site and is also a tributary of the Potomac River. The Potomac River is the back up water source for Harpers Ferry. This means that the activity at the site will have a critical influence on the drinking water

of Harpers Ferry. In this was the industry permitted by this change in zoning would undoubtedly endanger the health and safety of the community in Harpers Ferry.

The untoward health effects and individual economic consequences from the pollution emissions of the industry this rezoning will allow that will be born out over the length of peoples lives and that of their decedents for at least 3 generations is an egregious example of environmental injustice that should not be tolerated. This zoning change may be in one of the poorest sections of the county but the effects will be felt in every part of Ranson and the county.

The Comprehensive plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” The industry that this rezoning will allow will jeopardize the health, safety and welfare of Ranson, Harpers Ferry and the whole county. Please vote no on the ordinance #2017-302.

Sincerely,

Kelly Grove

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would negatively affect tourism, economic agility, groundwater quality, and individual health in neighboring municipalities like Shepherdstown.

Tourism is critically important to Shepherdstown's economy and to the county as a whole. In 2018, tourist spending in Jefferson County contributed over \$170 million to state and local government revenue and \$213 million in individual earnings. Importantly, most of this money comes from tourists visiting from neighboring states like Virginia, Maryland, and Washington D.C. Out-of-state tourists are largely drawn to Jefferson County because of its reputation for environmentally-friendly, sustainable industry. Key elements that support this reputation include the county's pastoral scenery and pristine natural resources. Ordinance #2017-302 will allow industry into Jefferson County that risks harming these elements and dramatically reducing the area's appeal to visitors. The resulting harm to our tourist industry would drive away visitors and decrease state, county, and local revenue. The long-term success of Jefferson County's tourism industry is dependent on local governments making coordinated zoning decisions. Allowing certain types in industry in Ranson will negatively affect tourism in every municipality throughout the county, including Shepherdstown. Voting no on ordinance #2017-302 will protect the foundations of the county's tourism industry and protect the 7,040 jobs in Jefferson County that are directly supported by tourism.

The type of large, consolidated industry that ordinance #2017-302 would allow in Ranson would generally reduce the flexibility of local economies in Jefferson County. Historically, the driving industries in Jefferson County have been tourism, agriculture, and the equine industries. These three industries are large conglomerates of small businesses. Small business is very important to Sheherdstown. Small businesses have been shown to create more jobs, cultivate more innovation, and provide more opportunities than big, non-local firms. Additionally, small businesses have been shown to be more reactive to sudden changes relative to manufacturing

businesses. Bringing large, manufacturing-based industry into Jefferson county will depress the local economy and stifle innovation. During this time of economic upheaval and uncertainty, Jefferson County needs to support industries that will allow local economies to adapt and recover as fast as possible.

Voting no on ordinance #2017-302 will help protect water resources throughout Jefferson County. The type of industry that ordinance #2017-302 would allow puts the ground resources of Jefferson county at significant risk due to the karst hydrogeology. The site in Ranson is in the Rocky Marsh Run watershed, which is in the source water protection zone for Shepherdstown and drains to the Potomac River. Therefore, activity at this site will affect both groundwater and surface water streams. In municipalities like Shepherdstown, many residents and nearby farms depend on wells for water. Contamination of groundwater aquifers would create both health and remediation concerns for local residents. Dye tests performed by the USGS near the area of proposed rezoning in Ranson have shown just how far-reaching groundwater contamination at the Ranson site could be. Results from the USGS study revealed measurable dye concentrations in Elk's Run, Rattlesnake Run, and even the Shepherdstown Town Run. This last run cuts through the center of Shepherdstown and is a favorite area for children to play and learn to fish.

Groundwater pollution is not the only concern for communities like Shepherdstown. The type of industry that ordinance #2017-302 would allow in Ranson would also generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. These pollutants are particularly harmful to children. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. The site in Ranson is across the road from an elementary school and also within the Jefferson High Middle district. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of children in Shepherdstown and all of Jefferson County.

I again request that you vote no on ordinance #2017-302. The long-term economic, environmental, and community health of municipalities like Shepherdstown depend on Ranson's participation in a coordinated zoning plan for all of Jefferson County.

Sincerely,

Melanie Jesteadt

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302.

I'm a concerned citizen who's family has owned property on route 480 (between Shepherdstown and Kearneysville) since the mid 60's. I understand the desire to bring business and Multinational investment to this area, but the risks associated with this particular business seem too high.

One of the biggest issues facing West Virginia today is the flight of young qualified minds to other parts of this country. This represents a negative return on investment for all West Virginians. To spend the money to educate them all the way until college, only to see them excel and leave the state? The reason so many leave is because the quality of life here obliterates the nostalgic pangs we might have for where we came of age. The dream of living where your family raised you some day becomes an increasingly irresponsible decision. What protections, monitoring technologies, guarantees under legal protection can this area offer someone who's home relies on clean groundwater for their well?

A lack of a guarantee on clean groundwater is more than enough to avoid this place, but there are plenty of other reasons too. It's bad enough that you pay for a 2020 internet connection and can't get better than a 2005 one. Bad too, that if you're livelihood is made out of state that the road's your only option to get there, as MARC funding continues to be underwhelming and not nearly enough trains coming and going. But surely you cannot think a large plant that conjures images of Martinsburg's cement plant is a good solution to whatever problems you think this solves. Every time I have to drive into Martinsburg along route 9 that eyesore is always staring back at me and I just shake my head.

Jefferson County has a natural beauty and rural landscape with quaint towns. It's proximity to DC and Baltimore mean that lots of people my age could have an opportunity to have the best

of both worlds: reside in a beautiful country landscape without the loss of earning potential that often goes with it. I lived in New York City for 7 years after college. Everyone there thought rent was way too high, but couldn't leave cause their job was there. Up on the Hudson, as far as two hours north, little towns are full of people who rely on the working mecca that is NYC. These towns are quaint communities, beautiful, people there pay higher rates in property prices because they get to live how they want while working they job they want. Sound like a place we know? As DC continues to renovate and gentrify, where's the next best alternative for people to settle? Loudon's as expensive as DC. People will come here. The higher revenues from these higher earners will mean infrastructure improvements, more trains, more train lines (more jobs and less wear and tear on roads used by people who don't work out of state). Its a future where people here can enjoy a steady rise in property value and leave a legacy to their children that is actually desirable, that their kids will be proud of.

You're throwing that away if you green-light this project. In stunning move after stunning move, I've watched from afar, and now up close, as this area continues to take fast money rather than smart money. You welcome the federal jobs and investment that come with eye sores like the facilities on 340. Those facilities mean more jobs, so developers buy up land as fast as they can for commercial and residential use. They built a massive strip mall behind Briar Run near Jefferson High School. Homes are for sale along the through traffic line that cars take to get to Home Depot or Glory Days at an alarming rate. More and more cookie cutter neighborhoods are sprouting up in those surrounding areas. Heavy traffic through down town Shepherdstown and along old 480 (now called Kearneysville Pike) seems to get louder and more frequent by the day. The "for sale" signs at the heart of these little towns that dot our county mean we're steering toward a Martinsburg dichotomy: a place where a downtown exists but no one in their right mind spends any time there.

So what does it get you if you continue on this path? Rather than moving out this way, folks will go further south in Virginia or deeper into Maryland to try and find some cheap imitation of what we have here, and frankly, I'll be one of them.

I wrestle constantly about what to do someday when our family home is mine to care for. It breaks my heart, but there is no way in the world I could consider raising my children in a place like what I'm describing, and if you allow this to go forward, that is what this place will be assured to become. The home that was built on my family's land was designed by grandfather. He and my grandmother would sit in their kitchen in Martinsburg drawing and correcting the blueprints as they saved to build a home on the property they had purchased. I spent all of my summers growing up at the place. It was my favorite place in the world. Then one day, as my grandfather's age meant he wanted to downsize, my parents decided to buy the place, and it became my home. I went to Jefferson High School, plenty of other graduates can tell you all about the memories this home has for them. Life times have come and gone on that land. Lives that I will always love and remember, that I want my kids to know and their kids.

We live in a country where we bulldoze anything and everything for progress, for money. We all need money, and being an adult means making tough choices. I know this whole situation is

probably making you crazy. You probably thought you were doing right by the county, or, hell maybe there's some money in it for you or people you love and you were just trying to get yours. No judgement. Life's complicated. Whatever your reasons, whatever you think of this situation and the people writing you or tweeting, facebooking, protesting, etc. I'm a person who's heart and soul is in this county, is on that land. I'm asking you, please, at least allow for the possibility that this is a mistake. That even though there's a ton of pressure and you all likely made up your minds about this years ago, maybe, just before it's too late, there's an opportunity to change your mind.

My family's past, present, and future are riding on it.

Thank you for your time and attention,

Casey DeMarco

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The city has failed to address the latter part of this objective. By Changing the SDI in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and child hood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health, and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and overall earnings for owners, breeders, and

trainers. This group provides over 70 million dollars in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. This industry would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitorship and again decreasing return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up this industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the Karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive plan is clear the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Chadwick Cooper

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would negatively affect tourism, economic agility, groundwater quality, and individual health in neighboring municipalities like Shepherdstown.

Tourism is critically important to Shepherdstown's economy and to the county as a whole. In 2018, tourist spending in the Jefferson County contributed over \$170 million to state and local government revenue and \$213 million in individual earnings. Importantly, most of this money comes from tourists visiting from neighboring states like Virginia, Maryland, and Washington D.C. Out-of-state tourists are largely drawn to Jefferson County because of its reputation for environmental-friendly, sustainable industry. Key elements that support this reputation include the county's pastoral scenery and pristine natural resources. Ordinance #2017-302 will allow industry into Jefferson County that risks harming these elements and dramatically reducing the area's appeal to visitors. The resulting harm to our tourist industry would drive away visitors and decrease state, county, and local revenue. The long-term success of Jefferson County's tourism industry is dependent on local governments making coordinated zoning decisions. Allowing certain types in industry in Ranson will negatively affect tourism in every municipality throughout the county, including Shepherdstown. Voting no on ordinance #2017-302 will protect the foundations of the county's tourism industry and protect the 7,040 jobs in Jefferson County that are directly supported by tourism.

The type of large, consolidated industry that ordinance #2017-302 would allow in Ranson would generally reduce the flexibility of local economies in Jefferson County. Historically, the driving industries in Jefferson County have been tourism, agriculture, and the equine industries. These three industries are large conglomerates of small businesses. Small business is very important to Sheherdstown. Small businesses have been shown to create more jobs, cultivate more innovation, and provide more opportunities than big, non-local firms. Additionally, small businesses have been shown to more reactive to sudden changes relative to manufacturing

businesses. Bringing large, manufacturing-based industry into Jefferson county will depress the local economy and stifle innovation. During this time of economic upheaval and uncertainty, Jefferson County needs to support industries that will allow local economies to adapt and recover as fast as possible.

Voting no on ordinance #2017-302 will help protect water resources throughout Jefferson County. The type of industry that ordinance #2017-302 would allow puts the ground resources of Jefferson county at significant risk due to the karst hydrogeology. The site in Ranson is in the Rocky Marsh Run watershed, which is in the source water protection zone for Shepherdstown and drains to the Potomac River. Therefore, activity at this site will affect both groundwater and surface water streams. In municipalities like Shepherdstown, many residents and nearby farms depend on wells for water. Contamination of groundwater aquifers would create both health and remediation concerns for local residents. Dye tests performed by the USGS near the area of proposed rezoning in Ranson have shown just how far-reaching groundwater contamination at the Ranson site could be. Results from the USGS study revealed measurable dye concentrations in Elk's Run, Rattlesnake Run, and even the Shepherdstown Town Run. This last run cuts through the center of Shepherdstown and is a favorite area for children to play and learn to fish.

Groundwater pollution is not the only concern for communities like Shepherdstown. The type of industry that ordinance #2017-302 would allow in Ranson would also generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. These pollutants are particularly harmful to children. Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask that you vote no on Ordinance #2017-302. While not in Ranson, the land and homes around the property that is the subject of the zoning change are closer to the property than anyone who currently lives within the city limits of Ranson. This area will be affected sooner and more harshly by the environmental issues that will develop secondary to the inappropriate siting of industry this zoning would allow.

The subject land has been well studied by Drs. Kozar, Doctor and Doctor and described in the scientific literature and USGS reports as having karst hydrology with very high aquifer vulnerability. The karst landscape is a consequence of the presence of soluble bedrock, which consists of limestone in the case of the subject land. In such landscapes water percolates through the ground and dissolves the underlying rock creating a porous network of caverns and throughways. Karst aquifers are known to be "extremely vulnerable to pollution" due to direct connection between the surface water and groundwater through both point (sinkholes) and diffuse (everywhere) infiltration. It is known from the Voluntary Remediation Plan of Jefferson Orchard that the groundwater at the subject site is only 60 feet below the ground. The subject property and much of the property around it are on an upland plain with few surface streams, but great seasonal variability in the water table resulting in numerous esteves and large amounts of water in the epikarst. This water is easily contaminated and this contamination spreads quickly throughout the aquifer. Dye tests performed near the subject site by the USGS have demonstrated this quick moving thorough dispersment in the aquifer in this area. While this contamination goes on to affect springs at the margins of the upland area continuing on in streams that service municipal water sources and the Potomac River, our concerns are far more immediate in both time and distance. Well water is the only water source available in the area of the proposed zoning change and, with the exception of Fox Glen, a majority of this water is supplied by private wells. Therefore, the groundwater aquifer fulfills a critical necessity, fulfilling all needs including human consumption, household uses, and agriculture and

maintenance of livestock and horses in the immediate area around the site. The concern is that if the aquifer becomes contaminated, then the local drinking water will be fouled.

For decades now, policy makers have been using “Aquifer Vulnerability,” to set land use and water resource protection policy. Karst has very high Aquifer Vulnerability. Therefore, this industrial use is not appropriate for this land and it should not be zoned for it. The guiding documents of the WVDEP recognize this. The introduction to the WVDEP document *Stormwater Management Design in Karst Areas* states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.”

The Chesapeake Bay Stormwater Network karst stormwater guidance document the *CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed*, which the WVDEP cites in its own guiding document *Stormwater Management Design in Karst Areas*, clearly agrees stating

“First, the effect of land development on karst terrain is complex and hard to predict, and requires professional analysis to reduce the risk of geological hazards, damage to infrastructure and groundwater contamination.”

“The working group acknowledges that past approaches to stormwater and land development in karst terrain have been inadequate to safeguard the public and the environment.”

“...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.”

We clearly need stronger comprehensive land use plans and zoning that direct new growth away from karst areas to more appropriate locations. Ordinance #2017-302 is literally the opposite of this.

Further, we cannot rely on the WVDEP to do the job that good local land use guidelines and zoning should do. For example, the *CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed* states that detention and retention ponds are not recommended on karst and categorize them as discouraged. Also, quoting WVDEP’s own karst guidance: “attenuating surface runoff will increase the rate of sinkhole formation and potential groundwater contamination.” Yet the entity currently planning to utilize this zoning change is planning employment of multiple massive retention ponds and attenuating surface runoff completely. This has already been approved by the DEP in two Construction Stormwater General Permit registrations for that company. One of detention ponds is not even regulated by the DEP as it contains process water and has no outlet. Clearly the DEP recognizes the risks but is not appropriately limiting them. Relying on the DEP to protect the public health, safety, welfare, and the environment from any entity in these karst locations is simply as the CNS bulletin said it “inadequate to safeguard the public and the environment.” We must have appropriate zoning that takes into consideration appropriate use of land with karst

hydrogeology. Ordinance #2017-302 does not do this, but instead increases the risk to the public and the environment.

A second serious concern is the air emissions from the industry that this zoning will provide for. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. These types of air emissions have been shown to increase the risk of, contribute to, and exacerbate a multitude of developmental, physical, physiological, physiological, cognitive and economic. The exposure of one individual can cause repercussions in multiple generations. Embryos, fetuses, and children are most vulnerable with effects born out over a lifetime, and that of their offspring. Many of these effects only require short-term exposure and some have even been shown to occur at levels below current limits recommended by the World Health Organization. One example of this is that a recent study found that “Even within the limits set by the World Health Organization, the pollutants PM10, SO₂, NO₂, and O₃ are associated with increased risk of treatment for respiratory diseases in children 0 to 6 years of age.” Unfortunately, the US limits are higher than WHO, 300 % higher in the case of PM10!

In fact, in 2019, in the Advice from the Independent Particulate Matter Review Panel (formerly U.S. EPA Clean Air Scientific Advisory Committee Particulate Matter Review Panel) on EPA’s Policy Assessment for the Review of the National Ambient Air Quality Standards for Particulate Matter, it stated that the committee unanimously and unequivocally found that the current primary annual and 24-hour PM_{2.5} National Ambient Air Quality Standards (NAAQS) are not adequate to protect public health. The advice from this 20-member committee, whose scientific disciplines include epidemiology, medicine, toxicology, air quality measurement, air quality modeling, exposure assessment measurement and modeling, risk assessment, statistics, and others, was ignored due presumably to political pressure. Not only are the NAAQS too high in some cases, but due to the measure and mechanism by which they work, they can not replace the safety provided by good land use and zoning regulations, that are meant to do things like keep factories with air emissions and hundreds of heavy trucks away from elementary schools. In fact, there is a state law that prohibits siting a school near a factory. Unfortunately, the reciprocal law does not exist. Clearly, just like with the water resources, we cannot rely on the DEP or the EPA to do the job of what appropriate zoning should do. The whole point of zoning is to keep people safe and provide for their health and welfare. Ordinance #2017-302 puts families and school children directly in harms way.

The air emissions, threat to the groundwater, and the very presence of the industry that this zoning change will allow for will have a serious negative economic effect on those who live and or work closest to the site in question. Productivity and workforce participation will be negatively affected by the health effects of the air emissions. The local agricultural operations will be negatively affected by the air emissions with lower quantity and quality of crop yield and would be devastated if the ground water aquifer were fouled. The equine operations in the area, of which there are several, will be negatively affected by the air emissions as they affect the horses’ health and performance. The mere presence of the industry that will be provided

for by this zoning change will cause property values to fall. There will be serious economic consequences for the immediate area around the site in question.

Several of the communities in the immediate area of the site for proposed zoning change are traditionally underserved and have lower economic status. The choice of this location for such a zoning change represents an egregious example of environmental injustice that should not be promulgated or tolerated.

This zoning change will provide for industry that will negatively affect the health safety and welfare of our community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Terri Ramos

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The city has failed to address the latter part of this objective. By Changing the SDI in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and child hood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health, and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and overall earnings for owners, breeders, and

trainers. This group provides over 70 million dollars in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. This industry would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitorship and again decreasing return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up this industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the Karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive plan is clear the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Kit McGinnis

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The city has failed to address the latter part of this objective. By Changing the SDI in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and child hood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health, and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and overall earnings for owners, breeders, and

trainers. This group provides over 70 million dollars in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. This industry would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitorship and again decreasing return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up this industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the Karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive plan is clear the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Jami Hadden

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that will significantly harm the municipalities within Jefferson County and beyond effecting the health, welfare, and safety of our community. Harpers Ferry is a national treasure with the natural and historic resources tours flock to see each year and one of the communities that will be negatively impacted by this zoning change.

According to a 2019 study by the West Virginia Tourism Office, Jefferson County generated an average of \$178 million per year in tourism-derived revenue for state and local governments over the last 10 years, more than any other county in West Virginia by at least double. Tourism benefits the businesses and economy of Ranson and Jefferson County producing \$213.7 million in individual earning, 7040 jobs, and \$842.6 million in direct spending here in 2018. We would need 40 Project Shuttles to replace the individual earnings and 59 Rockwools to replace the jobs provided by the tourism industry in Jefferson County. It is important to note that most of the money generated by tourism in Jefferson County comes from neighboring states. In this way, it is like an export: not simply recycling money, but bringing money into the state increasing its wealth. Much of the economy in Harpers Ferry is based on this tourism industry. A threat to this industry poses a threat to the economy and welfare of our community.

One of the important drivers for tourism in Harpers Ferry is the Appalachian Trail. According to the Appalachian Trail Conservancy (ATC), Harpers Ferry is the psychologic midpoint of the Trail, and hikers often plan extended stays in Jefferson County with an obvious positive impact. The ATC reports that the smokestacks and associated lights will be visible in the viewshed of 15 vistas on the Appalachian Trail (AT). Studies have shown that quality of vistas and human impact on the environment are not only noticed by visitors, but effect their experience. Another study published in the Journal of Applied Recreation Research, found that points of interests and views drew visitors' attention and had a significant impact on their perception of the trail. It was also found that particularly beautiful vistas helped visitors overlook elements

that usually have a negative effect on trail experience like increased trail traffic. A 2009 study in Leisure Sciences revealed that scenic value was a perceptual theme of Appalachian Trail visitors, and that things as simple as dead trees visible in a vista can have a negative impact on visitors' overall perception. Imagine the effect the smokestacks will have from the 15 vistas from which they will be visible. The introduction of industrial activity made possible by the proposed rezoning in Ranson would have a negative effect on the scenic views of beautiful landscapes from the Appalachian Trail in Jefferson County.

The smokestacks are not all visitors will be able to see — the air pollution will create haze. The effect of regional haze on tourists was explored in a review article published in the Atmospheric Environment titled "Impaired visibility: the air pollution people see." A key takeaway on the negative affect of haze on vacationing tourists was summarized as follows:

"Vacations offer an escape from the routine and stress of our daily lives. Vacation destinations are often chosen based on their scenery; vacations are spent gazing at monuments, mountains, clouds, and oceans. Good visibility allows clear observation of distant features and appreciation of the inherent beauty of these scenes...Air pollution, which is often present in both our cities and parks, interferes with these attributes and can ruin the views vacationers travel to enjoy."

People seek bucolic, unspoiled areas to escape the stresses of urban areas. A 2004 study in Environment and Behavior found perceived pollution causes stress while viewing natural scenes has both psychological and physiological benefits, and a 2007 study confirmed these benefits. Two other studies found that people are emotionally affected by poor visibility, and tourists are disappointed when views are obscured by haze.

The combination of smokestacks and haze will mar the viewshed and will not only reduce the positive effects of a scenic landscape but also leave tourists disappointed and dissatisfied with their choice of destination. With these effects the welfare of the Harpers Ferry community would undoubtedly be endangered by the industry that this zoning change will provide for.

Multiple studies by doctors Kozar, Doctor, and Doctor have demonstrated that the land at this site to be rezoned is Karst with the highest likelihood of sinkhole development in the county, and that the groundwater aquifer there is incredibly sensitive to contamination from surface water. Further, this site is on an upland plain with relatively few surface streams, seasonal variability in the water table that results in numerous estavelles, and large amounts of water in the epikarst. In this area contamination in surface water communicates easily to the water in the epikarst via diffuse and point infiltration, and the springs at the margins of the upland area are directly affected by the water quality throughout the aquifer. According to Jefferson Orchards Voluntary Remediation Plan with the WVDEP, the groundwater at the site is approximately 60 feet below the ground, and the tests performed by the USGS have shown that groundwater from just adjacent to this site emerged in the headwaters of both the Elk's Run and Rattlesnake Run. This is critically important for Harpers Ferry because the Elk's Run headwaters is a spring about three miles southeast of the site and goes on to become the drinking water source for Harpers Ferry and Bolivar before emptying into the Potomac River.

The headwaters of Rattlesnake Run is a spring about 3.5 miles from the site and is also a tributary of the Potomac River. The Potomac River is the back up water source for Harpers Ferry. This means that the activity at the site will have a critical influence on the drinking water of Harpers Ferry. In this was the industry permitted by this change in zoning would undoubtedly endanger the health and safety of the community in Harpers Ferry.

The untoward health effects and individual economic consequences from the pollution emissions of the industry this rezoning will allow that will be born out over the length of people's lives and that of their decedents for at least three generations is an egregious example of environmental injustice that should not be tolerated. This zoning change may be in one of the poorest sections of the county, but the effects will be felt in every part of Ranson and the county.

The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." The industry that this rezoning will allow will jeopardize the health, safety and welfare of Ranson, Harpers Ferry and the whole county. Please vote no on the ordinance #2017-302.

Sincerely,

Mary Brooke

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Please consider: Which way the wind blows is to an industrial plant as planting an oak tree on the property line is to a neighbor! Do they really deserve to clean up acorns for the rest of their life even though they benefit from the shade? I've lived downwind in Northern Virginia for twenty years and one thing I've noticed is West Virginia is no longer a state with nothing but hills or just that coal mine repository with relatively low population . The development in Northern Virginia is coming straight up route 9 to Charlestown and Kearnesyville and Harper's Ferry and West Virginia is benefiting. There's also Winchester not far away. Thinking of West Virginia as a rural, coal, vast land that can take another industrial player is ill advised. I understand that the need for energy and industrial production is necessary but we can't contaminate people in the process. I don't know what the answer is, and there is an answer, but blasting Northern Virginia with hazardous air emissions isn't one of them. I genuinely believe you leaders are smart enough to combine current day technology and your many years of experience to do the right thing. Please don't prove me wrong! I'm sick of explaining incompetence to my children with every news broadcast. We're all watching and waiting for you to succeed. Thanks.

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on #2017-302. The air emissions, possibility of ground and surface water contamination, and their effect on our interwoven economies threaten the health, safety and welfare of not just Jefferson County but the greater region, including Loudoun and the greater Northern Virginia area.

This zoning would provide for industry that produces large amounts of air emissions. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. Northern Virginia is directly downwind from these emissions. Much of the gaseous, fine particulate, and hazardous emissions can reach Northern Virginia. Further affecting the outdoor air quality of the adjacent portion of Virginia and the

ability of these areas to achieve and maintain National Ambient Air Quality Standards (NAAQS) attainment. This will affect agriculture and outdoor leisure and recreation.

For example, Loudoun County has been in nonattainment for the NAAQS 8-hour Ozone standard for the past two years. VOC and NO_x react after they have been emitted to produce ground level ozone. The industry that this rezoning would provide for would produce large amounts of these emissions. This would make it even harder as Loudoun County tries to achieve attainment. As time goes on and the scientific research advances our knowledge and understanding of the extent to which gaseous, particulate and hazardous emissions affect human health the NAAQS standards are likely to be reduced. The effects on air emission from this rezoning will make it only harder for Loudoun and Northern Virginia to meet these standards.

In addition to the concerns about the air, the possible ground and surface water contamination is very concerning to Loudoun and Virginia residents. The site is known to have ground water that is vulnerable to contamination due to the karst hydrogeology. A USGS study demonstrated that the ground water adjacent to the site to be rezoned communicates readily with surface water tributaries of the Potomac River. In addition to direct infiltration where water moves directly from the surface to groundwater via porous limestone bedrock, karst is known to have severe ground instability problems. This makes karst geology prone to sinkhole development. Sinkholes provide direct connection between the surface water and any contaminants it may contain and the groundwater. This makes the aquifer vulnerability in karst areas very high, and contamination with industrial activity such as that provided for by this rezoning too likely.

Loudoun sources its drinking water from the Potomac River, downstream of many West Virginia tributaries that carry water from the epikarst and groundwater aquifer at the site to be rezoned. Loudoun has recently completed the new Trap Rock Water Treatment facility, which draws water from the Potomac River. Loudoun currently provides 40 million gallons and projects to provide 90 million gallons of drinking water a day to customers by 2040 (Loudounwater.org). Therefore, the viability of the Potomac River is a high priority for Virginia residents.

Loudoun and Northern Virginia is one of the fastest growing communities in the country and provides a lot to Jefferson County in their symbiotic relationship. Virginia residents support and enjoy Jefferson County through tourism, as our residents enjoy the natural and historical resources of your county. Virginia residents and businesses support the equine industry in a multitude of ways from providing wagering fans at the races to the Virginia Breeders Association Virginia Certified incentive programs and a strong market for retired racehorses. According to an economic impact study from WVU, at least 40% of Jefferson County residents travel outside of West Virginia for work, a good percentage of those travel to northern Virginia. This rezoning would allow for industry that would negatively affect the economy of both places and this relationship and the benefits for our residents gleaned from it.

This zoning change will provide for industry that will negatively effect the health safety and welfare of the Loudon and Northern Virginia community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Charles Pape

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would negatively affect tourism, economic agility, groundwater quality, and individual health in neighboring municipalities like Shepherdstown.

Tourism is critically important to Shepherdstown's economy and to the county as a whole. In 2018, tourist spending in the Jefferson County contributed over \$170 million to state and local government revenue and \$213 million in individual earnings. Importantly, most of this money comes from tourists visiting from neighboring states like Virginia, Maryland, and Washington D.C. Out-of-state tourists are largely drawn to Jefferson County because of its reputation for environmental-friendly, sustainable industry. Key elements that support this reputation include the county's pastoral scenery and pristine natural resources. Ordinance #2017-302 will allow industry into Jefferson County that risks harming these elements and dramatically reducing the area's appeal to visitors. The resulting harm to our tourist industry would drive away visitors and decrease state, county, and local revenue. The long-term success of Jefferson County's tourism industry is dependent on local governments making coordinated zoning decisions. Allowing certain types in industry in Ranson will negatively affect tourism in every municipality throughout the county, including Shepherdstown. Voting no on ordinance #2017-302 will protect the foundations of the county's tourism industry and protect the 7,040 jobs in Jefferson County that are directly supported by tourism.

The type of large, consolidated industry that ordinance #2017-302 would allow in Ranson would generally reduce the flexibility of local economies in Jefferson County. Historically, the driving industries in Jefferson County have been tourism, agriculture, and the equine industries. These three industries are large conglomerates of small businesses. Small business is very important to Sheherdstown. Small businesses have been shown to create more jobs, cultivate more innovation, and provide more opportunities than big, non-local firms. Additionally, small businesses have been shown to more reactive to sudden changes relative to manufacturing

businesses. Bringing large, manufacturing-based industry into Jefferson county will depress the local economy and stifle innovation. During this time of economic upheaval and uncertainty, Jefferson County needs to support industries that will allow local economies to adapt and recover as fast as possible.

Voting no on ordinance #2017-302 will help protect water resources throughout Jefferson County. The type of industry that ordinance #2017-302 would allow puts the ground resources of Jefferson county at significant risk due to the karst hydrogeology. The site in Ranson is in the Rocky Marsh Run watershed, which is in the source water protection zone for Shepherdstown and drains to the Potomac River. Therefore, activity at this site will affect both groundwater and surface water streams. In municipalities like Shepherdstown, many residents and nearby farms depend on wells for water. Contamination of groundwater aquifers would create both health and remediation concerns for local residents. Dye tests performed by the USGS near the area of proposed rezoning in Ranson have shown just how far-reaching groundwater contamination at the Ranson site could be. Results from the USGS study revealed measurable dye concentrations in Elk's Run, Rattlesnake Run, and even the Shepherdstown Town Run. This last run cuts through the center of Shepherdstown and is a favorite area for children to play and learn to fish.

Groundwater pollution is not the only concern for communities like Shepherdstown. The type of industry that ordinance #2017-302 would allow in Ranson would also generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. These pollutants are particularly harmful to children. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. The site in Ranson is across the road from an elementary school and also within the Jefferson High Middle district. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of children in Shepherdstown and all of Jefferson County.

I again request that you vote no on ordinance #2017-302. The long-term economic, environmental, and community health of municipalities like Shepherdstown depend on Ranson's participation in a coordinated zoning plan for all of Jefferson County.

Sincerely,

Kara Myren

The resulting harm to our tourist industry would drive away visitors and decrease state, county, and local revenue. The long-term success of Jefferson County's tourism industry is dependent on local governments making coordinated zoning decisions. Allowing certain types in industry in Ranson will negatively affect tourism in every municipality throughout the county, including Shepherdstown. Voting no on ordinance #2017-302 will protect the foundations of the county's tourism industry and protect the 7,040 jobs in Jefferson County that are directly supported by tourism.

The type of large, consolidated industry that ordinance #2017-302 would allow in Ranson would generally reduce the flexibility of local economies in Jefferson County. Historically, the driving industries in Jefferson County have been tourism, agriculture, and the equine industries. These three industries are large conglomerates of small businesses. Small business is very important

to Shepherdstown. Small businesses have been shown to create more jobs, cultivate more innovation, and provide more opportunities than big, non-local firms. Additionally, small businesses have been shown to be more reactive to sudden changes relative to manufacturing businesses. Bringing large, manufacturing-based industry into Jefferson County will depress the local economy and stifle innovation. During this time of economic upheaval and uncertainty, Jefferson County needs to support industries that will allow local economies to adapt and recover as fast as possible.

Voting no on ordinance #2017-302 will help protect water resources throughout Jefferson County. The type of industry that ordinance #2017-302 would allow puts the ground resources of Jefferson County at significant risk due to the karst hydrogeology. The site in Ranson is in the Rocky Marsh Run watershed, which is in the source water protection zone for Shepherdstown and drains to the Potomac River. Therefore, activity at this site will affect both groundwater and surface water streams. In municipalities like Shepherdstown, many residents and nearby farms depend on wells for water. Contamination of groundwater aquifers would create both health and remediation concerns for local residents. Dye tests performed by the USGS near the area of proposed rezoning in Ranson have shown just how far-reaching groundwater contamination at the Ranson site could be. Results from the USGS study revealed measurable dye concentrations in Elk's Run, Rattlesnake Run, and even the Shepherdstown Town Run. This last run cuts through the center of Shepherdstown and is a favorite area for children to play and learn to fish.

Groundwater pollution is not the only concern for communities like Shepherdstown. The type of industry that ordinance #2017-302 would allow in Ranson would also generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. These pollutants are particularly harmful to children. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. The site in Ranson is across the road from an elementary school and also within the Jefferson High Middle district. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of children in Shepherdstown and all of Jefferson County.

I again request that you vote no on ordinance #2017-302. The long-term economic, environmental, and community health of municipalities like Shepherdstown depend on Ranson's participation in a coordinated zoning plan for all of Jefferson County.

Sincerely,

Ottilia Smith
Shepherdstown, 25443

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask that you vote no on Ordinance #2017-302. While not in Ranson, the land and homes around the property that is the subject of the zoning change are closer to the property than anyone who currently lives within the city limits of Ranson. This area will be affected sooner and more harshly by the environmental issues that will develop secondary to the inappropriate siting of industry this zoning would allow.

I live in Duffields, within 2 miles of the proposed Rockwool plant. I am concerned about a number of effects it will have on the immediate vicinity. I am foremost concerned about the effects on ground water. My water is provided by a well on my property. The karst geology of this region increases the chance for polluting the water aquifer, and it seems that the location of the Rockwool plant is in an area most susceptible to sinkhole formation and possible environmental catastrophe. What will I do if my well water is contaminated? There is no municipal water line that I can tap into. I am equally concerned about the increase in heavy trucks in the area. I live at the corner of Flowing Springs Road and Luther Jones Road. Luther Jones experiences higher than normal traffic of dump trucks and semi-trucks DAILY. I don't know what the road is rated, but there are no painted road lines so I question whether it is in fact designed to handle such heavy vehicles. It seems that they are using Luther Jones Road as a shortcut to bypass congestion in Charles Town. I fear that it will only increase if Rockwool begins operation. I am concerned about significant noise AND light pollution from a plant that runs 24/7. And lastly, I am concerned (outraged, really) that Ranson is controlling what is going on in my neighborhood and not Kearyneysville or Shenandoah Junction. The annexation should never have been allowed to happen. It is not different than gerrymandering congressional districts. Ranson is allowed to dictate what is happening but WILL NOT suffer the immediate consequences.

The subject land has been well studied by Drs. Kozar, Doctor and Doctor and described in the scientific literature and USGS reports as having karst hydrology with very high aquifer

vulnerability. The karst landscape is a consequence of the presence of soluble bedrock, which consists of limestone in the case of the subject land. In such landscapes water percolates through the ground and dissolves the underlying rock creating a porous network of caverns and throughways. Karst aquifers are known to be “extremely vulnerable to pollution” due to direct connection between the surface water and groundwater through both point (sinkholes) and diffuse (everywhere) infiltration. It is known from the Voluntary Remediation Plan of Jefferson Orchard that the groundwater at the subject site is only 60 feet below the ground. The subject property and much of the property around it are on an upland plain with few surface streams, but great seasonal variability in the water table resulting in numerous estavelles and large amounts of water in the epikarst. This water is easily contaminated and this contamination spreads quickly throughout the aquifer. Dye tests performed near the subject site by the USGS have demonstrated this quick moving thorough dispersment in the aquifer in this area. While this contamination goes on to affect springs at the margins of the upland area continuing on in streams that service municipal water sources and the Potomac River, our concerns are far more immediate in both time and distance. Well water is the only water source available in the area of the proposed zoning change and, with the exception of Fox Glen, a majority of this water is supplied by private wells. Therefore, the groundwater aquifer fulfills a critical necessity, fulfilling all needs including human consumption, household uses, and agriculture and maintenance of livestock and horses in the immediate area around the site. The concern is that if the aquifer becomes contaminated, then the local drinking water will be fouled.

For decades now, policy makers have been using “Aquifer Vulnerability,” to set land use and water resource protection policy. Karst has very high Aquifer Vulnerability. Therefore, this industrial use is not appropriate for this land and it should not be zoned for it. The guiding documents of the WVDEP recognize this. The introduction to the WVDEP document Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.”

The Chesapeake Bay Stormwater Network karst stormwater guidance document the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed, which the WVDEP cites in its own guiding document Stormwater Management Design in Karst Areas, clearly agrees stating:

“First, the effect of land development on karst terrain is complex and hard to predict, and requires professional analysis to reduce the risk of geological hazards, damage to infrastructure and groundwater contamination.” “The working group acknowledges that past approaches to stormwater and land development in karst terrain have been inadequate to safeguard the public and the environment.” “...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” We clearly need stronger comprehensive land use plans and zoning that

direct new growth away from karst areas to more appropriate locations. Ordinance #2017-302 is literally the opposite of this.

Further, we cannot rely on the WVDEP to do the job that good local land use guidelines and zoning should do. For example, the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed states that detention and retention ponds are not recommended on karst and categorize them as discouraged. Also, quoting WVDEP's own karst guidance: "attenuating surface runoff will increase the rate of sinkhole formation and potential groundwater contamination." Yet the entity currently planning to utilize this zoning change is planning employment of multiple massive retention ponds and attenuating surface runoff completely. This has already been approved by the DEP in two Construction Stormwater General Permit registrations for that company. One of detention ponds is not even regulated by the DEP as it contains process water and has no outlet. Clearly the DEP recognizes the risks but is not appropriately limiting them. Relying on the DEP to protect the public health, safety, welfare, and the environment from any entity in these karst locations is simply as the CNS bulletin said it "inadequate to safeguard the public and the environment." We must have appropriate zoning that takes into consideration appropriate use of land with karst hydrogeology. Ordinance #2017-302 does not do this, but instead increases the risk to the public and the environment.

A second serious concern is the air emissions from the industry that this zoning will provide for. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. These types of air emissions have been shown to increase the risk of, contribute to, and exacerbate a multitude of developmental, physical, physiological, physiological, cognitive and economic. The exposure of one individual can cause repercussions in multiple generations. Embryos, fetuses, and children are most vulnerable with effects born out over a lifetime, and that of their offspring. Many of these effects only require short-term exposure and some have even been shown to occur at levels below current limits recommended by the World Health Organization. One example of this is that a recent study found that "Even within the limits set by the World Health Organization, the pollutants PM₁₀, SO₂, NO₂, and O₃ are associated with increased risk of treatment for respiratory diseases in children 0 to 6 years of age." Unfortunately, the US limits are higher than WHO, 300 % higher in the case of PM₁₀!

In fact, in 2019, in the Advice from the Independent Particulate Matter Review Panel (formerly U.S. EPA Clean Air Scientific Advisory Committee Particulate Matter Review Panel) on EPA's Policy Assessment for the Review of the National Ambient Air Quality Standards for Particulate Matter, it stated that the committee unanimously and unequivocally found that the current primary annual and 24-hour PM_{2.5} National Ambient Air Quality Standards (NAAQS) are not adequate to protect public health. The advice from this 20-member committee, whose scientific disciplines include epidemiology, medicine, toxicology, air quality measurement, air quality modeling, exposure assessment measurement and modeling, risk assessment, statistics, and others, was ignored due presumably to political pressure. Not only are the NAAQS too high in some cases, but due to the measure and mechanism by which they work, they can not

replace the safety provided by good land use and zoning regulations, that are meant to do things like keep factories with air emissions and hundreds of heavy trucks away from elementary schools. In fact, there is a state law that prohibits siting a school near a factory. Unfortunately, the reciprocal law does not exist. Clearly, just like with the water resources, we cannot rely on the DEP or the EPA to do the job of what appropriate zoning should do. The whole point of zoning is to keep people safe and provide for their health and welfare. Ordinance #2017-302 puts families and school children directly in harms way.

The air emissions, threat to the groundwater, and the very presence of the industry that this zoning change will allow for will have a serious negative economic effect on those who live and or work closest to the site in question. Productivity and workforce participation will be negatively affected by the health effects of the air emissions. The local agricultural operations will be negatively affected by the air emissions with lower quantity and quality of crop yield and would be devastated if the ground water aquifer were fouled. The equine operations in the area, of which there are several, will be negatively affected by the air emissions as they affect the horses' health and performance. The mere presence of the industry that will be provided for by this zoning change will cause property values to fall. There will be serious economic consequences for the immediate area around the site in question.

Several of the communities in the immediate area of the site for proposed zoning change are traditionally underserved and have lower economic status. The choice of this location for such a zoning change represents an egregious example of environmental injustice that should not be promulgated or tolerated.

This zoning change will provide for industry that will negatively affect the health safety and welfare of our community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Stephanie Webb

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

This zoning change will provide for industry that will negatively affect the agriculture industry in Jefferson County and beyond. The combination of the air emissions and threat to the ground water resources could have devastating consequences for the agricultural community of Jefferson County.

The agriculture industry in Jefferson County is hundreds of years old and continues to serve our community well today. According to the economic impact study "A Shared Agenda for Growing West Virginia's Agricultural Economy, Prepared by Fourth Economy for West Virginia Department Of Agriculture West Virginia University Extension Service 2012," Jefferson County is the second highest producing county for crops sales, third highest for fruits and vegetables sales, and in the top 9 counties for sales of animals and animal products.

Agriculture, tourism and the equine industries work synergistically to have an outsized positive impact on the economy in Ranson and Jefferson County as a whole. Agriculture drives tourism by creating agro-tourism opportunities, preserving beautiful open spaces that contribute to the bucolic nature of our county, and providing the locally produced agriculture goods many tourists are look for in our markets and restaurants. Agriculture also supports the equine industry by providing local products like hay and straw, helping maintain pasture land, co-supporting local dual-purpose retail stores, and helping recycle by products. Agriculture helps maintain the way of life that many those who choose to live in Jefferson County enjoy. Industrial manufacturing and industry this zoning will provide for could never achieve these things.

Local agriculture also provides a source of locally produced agricultural goods. It has become apparent with the current pandemic and health emergency. This became a supply chain crisis because as our supply chains have moved to be ever more lean and efficient they lack resiliency and agility. By having a local source of agricultural goods and food we add resiliency and agility

into our own economy and community. The agricultural industry in Jefferson County provides this.

A plethora of scientific studies have shown that a variety of air pollutants produced by the type of industry this zoning change would provide for causes decreased yields of both quantity and quality for several of the crops important to Jefferson County including winter wheat and soybeans. Soybeans and wheat are two of the crops significantly affected and two of the most prevalent crops in Jefferson County. Lower crop yields harm the farms and all the members of the down stream supply chain as well as the consumer.

Recent studies have shown that even small increases in air pollution affect the productivity of agricultural workers. Similar to the reduction in crop yield this will negatively affect the individual workers, businesses, consumers and industry as a whole.

Even more devastating is the possibility of groundwater contamination. The land at the subject location has karst hydrogeology and as such has porous bedrock and severe ground instability problems. The porous bedrock allows rapid diffuse infiltration of surface water into ground water and the severe ground instability problems leads to sinkhole development. Sinkholes provide direct connection of the surface water with the ground water aquifer through point infiltration. In fact, according to a 2012 study by Doctor and Doctor, the subject location and that of Terrapins Neck have the highest sinkhole vulnerability of any sites in Jefferson County. The propensity and easy of diffuse and point infiltration in areas of karst hydrogeology give them very high aquifer vulnerability meaning the aquifer is very vulnerable to contamination. For this reason, this measure has been used for decades by policymakers to set land use regulations.

The WVDEP recognizes development in car karst areas puts water resources high-risk for contamination but also recognizes that this is best protected against true local land use and zoning ordinances. WVDEP's guiding document *Stormwater Management Design in Karst Areas* states, "it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." This document also references the Chesapeake Bay Stormwater Network karst stormwater guidance document the *CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed*. In which it states "...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." Land use policy in Ranson and zoning need to take aquifer vulnerability into consideration as these agencies and documents suggest.

The Jefferson Orchards Voluntary Remediation Plan application reports that the ground water is only 60 feet from the surface at the site. It is described in the scientific literature that this land is an upland plane with large amounts of water in the epikarst, and contamination of this

water effects the whole aquifer including the communications with surface water streams. A USGS study demonstrated that the groundwater adjacent to the site communicates readily with several surface water structures and wells miles away from the site. The effects of contamination at this site would go well beyond Ranson fouling large portions of the ground water and surface water in Jefferson County.

Groundwater contamination at the site would have devastating effects on the Agricultural industry in Jefferson county. For geographic and economic reasons it is simply infeasible for the agricultural industry to rely on utility provided water. Based on the scientific literature the site being considered for rezoning is one of the areas of highest aquifer vulnerability in Jefferson County and is inappropriate for the industry that this zoning change will provide for.

By threatening the local agricultural industry, the industry that this zoning will provide for will threaten the health, safety, and welfare of the community. The Comprehensive Plan in Ranson is clear the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Randy Lukens

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Dear Ranson Officials: please vote No on 2017-302 As a 45-year resident of Jefferson County, I am deeply concerned that our beautiful county, bordered by scenic rivers and mountains, will be polluted by heavy industry. Please don't leave this legacy of contaminated air and water to future generations and custodians of this land.

Thank you

judith jenner

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would negatively affect tourism, economic agility, groundwater quality, and individual health in neighboring municipalities like Shepherdstown.

Tourism is critically important to Shepherdstown's economy and to the county as a whole. In 2018, tourist spending in the Jefferson County contributed over \$170 million to state and local government revenue and \$213 million in individual earnings. Importantly, most of this money comes from tourists visiting from neighboring states like Virginia, Maryland, and Washington D.C. Out-of-state tourists are largely drawn to Jefferson County because of its reputation for environmental-friendly, sustainable industry. Key elements that support this reputation include the county's pastoral scenery and pristine natural resources. Ordinance #2017-302 will allow industry into Jefferson County that risks harming these elements and dramatically reducing the area's appeal to visitors. The resulting harm to our tourist industry would drive away visitors and decrease state, county, and local revenue. The long-term success of Jefferson County's tourism industry is dependent on local governments making coordinated zoning decisions. Allowing certain types in industry in Ranson will negatively affect tourism in every municipality throughout the county, including Shepherdstown. Voting no on ordinance #2017-302 will protect the foundations of the county's tourism industry and protect the 7,040 jobs in Jefferson County that are directly supported by tourism.

The type of large, consolidated industry that ordinance #2017-302 would allow in Ranson would generally reduce the flexibility of local economies in Jefferson County. Historically, the driving industries in Jefferson County have been tourism, agriculture, and the equine industries. These three industries are large conglomerates of small businesses. Small business is very important to Sheherdstown. Small businesses have been shown to create more jobs, cultivate more innovation, and provide more opportunities than big, non-local firms. Additionally, small businesses have been shown to more reactive to sudden changes relative to manufacturing

businesses. Bringing large, manufacturing-based industry into Jefferson county will depress the local economy and stifle innovation. During this time of economic upheaval and uncertainty, Jefferson County needs to support industries that will allow local economies to adapt and recover as fast as possible.

Voting no on ordinance #2017-302 will help protect water resources throughout Jefferson County. The type of industry that ordinance #2017-302 would allow puts the ground resources of Jefferson county at significant risk due to the karst hydrogeology. The site in Ranson is in the Rocky Marsh Run watershed, which is in the source water protection zone for Shepherdstown and drains to the Potomac River. Therefore, activity at this site will affect both groundwater and surface water streams. In municipalities like Shepherdstown, many residents and nearby farms depend on wells for water. Contamination of groundwater aquifers would create both health and remediation concerns for local residents. Dye tests performed by the USGS near the area of proposed rezoning in Ranson have shown just how far-reaching groundwater contamination at the Ranson site could be. Results from the USGS study revealed measurable dye concentrations in Elk's Run, Rattlesnake Run, and even the Shepherdstown Town Run. This last run cuts through the center of Shepherdstown and is a favorite area for children to play and learn to fish.

Groundwater pollution is not the only concern for communities like Shepherdstown. The type of industry that ordinance #2017-302 would allow in Ranson would also generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. These pollutants are particularly harmful to children. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. The site in Ranson is across the road from an elementary school and also within the Jefferson High Middle district. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of children in Shepherdstown and all of Jefferson County.

I again request that you vote no on ordinance #2017-302. The long-term economic, environmental, and community health of municipalities like Shepherdstown depend on Ranson's participation in a coordinated zoning plan for all of Jefferson County.

Sincerely,

Donna Deen

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that will significantly harm the municipalities within Jefferson County and beyond effecting the health, welfare, and safety of our community. Harpers Ferry is a national treasure with the natural and historic resources tours flock to see each year and one of the communities that will be negatively impacted by this zoning change.

According to a 2019 study by the West Virginia Tourism Office, Jefferson County generated and average of \$178 million per year in tourism-derived revenue for state and local governments over the last 10 years, more than any other county in West Virginia by at least double. Tourism benefits the businesses and economy of Ranson and Jefferson County producing \$213.7 million in individual earning, 7040 jobs, and \$842.6 million in direct spending here in 2018. We would need 40 Project Shuttles to replace the individual earnings and 59 Rockwools to replace the jobs provided by the tourism industry in Jefferson County. It is important to note that most of the money generated by tourism in Jefferson County comes from neighboring states. In this way it is like an export. Not simply recycling money but bringing money into the state increasing its wealth. Much of the economy in Harpers Ferry is based on this tourism industry. A threat to this industry poses a threat to the economy and welfare of our community.

One of the important drivers for tourism in Harpers Ferry is the Appalachian Trail. According to the Appalachian Trail Conservancy (ATC), Harpers Ferry is the psychologic midpoint of the Trail, and Hikers often plan extended stays in Jefferson County with an obvious positive impact. The ATC reports that the smokestacks and associated lights will be visible in the view shed of 15 vistas on the Appalachian Trail (AT). Studies have shown that quality of vistas and human impact on the environment are not only noticed by visitors but effect their experience. Another study published in the Journal of Applied Recreation Research, found that points of interests and views drew visitors' attention and had a significant impact on their perception of the trail. It was also found that particularly beautiful vistas helped visitors overlook elements that usually

have a negative effect on trail experience like increased trail traffic. A 2009 study in Leisure Sciences revealed that scenic value was a perceptual theme of Appalachian Trail visitors, and that things as simple as dead trees visible in a vista can have a negative impact on visitors overall perception. Imagine the effect the smokestacks will have from the 15 vistas from which they will be visible. The introduction of industrial activity made possible by the proposed rezoning in Ranson would have a negative effect on the scenic views of beautiful landscapes from the Appalachian Trail in Jefferson County.

The smokestacks are not all visitors will be able to see, the air pollution will create haze. The effect of regional haze on tourists was explored in a review article published in the *Atmospheric Environment* titled "Impaired visibility: the air pollution people see." A key takeaway on the negative affect of haze on vacationing tourists was summarized as follows: "Vacations offer an escape from the routine and stress of our daily lives. Vacation destinations are often chosen based on their scenery; vacations are spent gazing at monuments, mountains, clouds, and oceans. Good visibility allows clear observation of distant features and appreciation of the inherent beauty of these scenes...Air pollution, which is often present in both our cities and parks, interferes with these attributes and can ruin the views vacationers travel to enjoy." People seek bucolic, unspoiled areas to escape the stresses of urban areas. A 2004 study in *Environment and Behavior* found Perceived pollution causes stress while viewing natural scenes has both psychological and physiological benefits, and a 2007 study confirmed these benefits. Two other studies found that people are emotionally affected by poor visibility, and tourists are disappointed when views are obscured by haze. The combination of smokestacks and haze will mar the viewshed and will not only reduce the positive effects of a scenic landscape but also leave tourists disappointed and dissatisfied with their choice of destination. With these effects the welfare of the Harpers Ferry community would undoubtedly be endangered by the industry that this zoning change will provide for.

Multiple studies by doctors Kozar, Doctor, and Doctor have demonstrated that the land at this site to be rezoned is Karst with the highest likelihood of sinkhole development in the county, and that the ground water aquifer there is incredibly sensitive to contamination from surface water. Further, this site is on an upland plain with relatively few surface streams, seasonal variability in the water table that results in numerous estavelles, and large amounts of water in the epikarst. In this area contamination in surface water communicates easily to the water in the epikarst via diffuse and point infiltration, and the springs at the margins of the upland area are directly affected by the water quality throughout the aquifer. According to Jefferson Orchards Voluntary Remediation Plan with the WVDEP, the ground water at the site is approximately 60 feet below the ground, and the tests performed by the USGS have shown that ground water from just adjacent to this site emerged in the headwaters of both the Elk's Run and Rattlesnake Run. This is critically important for Harpers Ferry because the Elk's Run headwaters is a spring about three miles south east of the site and goes on to become the drinking water source for Harpers Ferry and Bolivar before emptying into the Potomac River. The headwaters of Rattlesnake Run is a spring about 3.5 miles from the site and is also a tributary of the Potomac River. The Potomac River is the back up water source for Harpers Ferry. This means that the activity at the site will have a critical influence on the drinking water

of Harpers Ferry. In this was the industry permitted by this change in zoning would undoubtedly endanger the health and safety of the community in Harpers Ferry.

The untoward health effects and individual economic consequences from the pollution emissions of the industry this rezoning will allow that will be born out over the length of peoples lives and that of their decedents for at least 3 generations is an egregious example of environmental injustice that should not be tolerated. This zoning change may be in one of the poorest sections of the county but the effects will be felt in every part of Ranson and the county.

The Comprehensive plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” The industry that this rezoning will allow will jeopardize the health, safety and welfare of Ranson, Harpers Ferry and the whole county. Please vote no on the ordinance #2017-302.

Sincerely,

Dale Horensky
Harpers Ferry, 25425

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The city has failed to address the latter part of this objective. By Changing the SDI in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and child hood as development is exquisitely sensitive during these times, but the effects are realized through out life negatively impacting a variety of lifetime parameters including physical and mental health, and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over 70 million dollars in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and over all earnings. This industry would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitorship and again decreasing return on investment, cash flow, and over all earnings for the hundreds of small businesses that make up this industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the Karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive plan is clear the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

William Fogelsanger

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would have a negative effect on water and air quality in neighboring states such as Maryland.

The Potomac River provides drinking water and a source of recreation to Maryland residents. Water and air pollution generated within the Potomac River's watershed will inevitably contaminate this valuable waterway. The site of the proposed zoning change in Ranson is located within the Potomac River Watershed.

The type of industry that ordinance #2017-30 would allow in Ranson would generate large quantities of wastewater, stored on-site, in an area of known karst terrain. The West Virginia Department of Environmental Protection has published guidelines that specifically discourage extensive development in areas of karst terrain because of the vulnerability of karst aquifers to contamination by surface pollution. Karst features increase surface water and groundwater connectivity and any spills or surface releases quickly percolate into the groundwater. Additionally, sinkholes are common in karst terrain and can cause ruptures in wastewater impoundments. Even if appropriate attempts are made to contain and manage wastewater and other stormwater runoff on-site, there is still a high risk that wastewater could contaminate the groundwater through tears and catastrophic failure of wastewater impoundments. Contaminated groundwater in karst terrain can easily resurface in waterways several miles away, as shown by a USGS tracer study conducted near the site in Ranson. The USGS study detected tracer dye in multiple springs and waterways miles from the initial injection site in Ranson. All of these waterways drain into the Potomac River.

Mismanagement of wastewater could also lead to contamination of nearby surface waters. For example, the site of the proposed rezoning in Ranson is in the Rocky Marsh Run watershed. Rocky Marsh Run also drains to the Potomac River. Voting no on ordinance #2017-30 will

preserve downstream water quality and ensure that the Potomac River remains usable for Maryland residents.

Air pollution poses another risk to Maryland residents. The type of industry that ordinance #2017-302 would allow would generate air pollutants like fine particulate matter. According to the US EPA, fine particulates can travel 100s of miles from its original source. Air pollution related to industrial activity in Ranson could easily reach Maryland. Fine particulates have a greater affinity for carrying toxic compounds and their small size allows them to be inhaled more deeply into the lungs. Chronic exposure to fine particulate matter is associated with increased risk of Alzheimer's in adults. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. Fine particulate matter also exacerbates regional haze which creates a visible reminder of air pollution. The psychological effects that arise from an increased perception of pollution include stress, anxiety, and unhappiness. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of Maryland residents.

I again request that you vote no on ordinance #2017-302. Zoning decisions in Ranson and Jefferson County have an undeniable influence on the quality of life in neighboring states.

Sincerely,

Leslie Moore

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask you to vote NO on Ordinance #2017-302. The industry this zoning change will allow for endangers the health, safety and, welfare of the community, and violates the premise of the smart code zoning that we have spent so much time, effort and federal money employing.

This zoning change will provide for industry that will negatively affect the agriculture industry in Jefferson County and beyond. The combination of the air emissions and threat to the ground water resources could have devastating consequences for the agricultural community of Jefferson County.

The agriculture industry in Jefferson County is hundreds of years old and continues to serve our community well today. According to the economic impact study "A Shared Agenda for Growing West Virginia's Agricultural Economy, Prepared by Fourth Economy for West Virginia Department Of Agriculture West Virginia University Extension Service 2012," Jefferson County is the second highest producing county for crops sales, third highest for fruits and vegetables sales, and in the top 9 counties for sales of animals and animal products.

Agriculture, tourism and the equine industries work synergistically to have an outsized positive impact on the economy in Ranson and Jefferson County as a whole. Agriculture drives tourism by creating agro-tourism opportunities, preserving beautiful open spaces that contribute to the bucolic nature of our county, and providing the locally produced agriculture goods many tourists are look for in our markets and restaurants. Agriculture also supports the equine industry by providing local products like hay and straw, helping maintain pasture land, co-supporting local dual-purpose retail stores, and helping recycle by products. Agriculture helps maintain the way of life that many those who choose to live in Jefferson County enjoy. Industrial manufacturing and industry this zoning will provide for could never achieve these things.

Local agriculture also provides a source of locally produced agricultural goods. It has become apparent with the current pandemic and health emergency. This became a supply chain crisis because as our supply chains have moved to be ever more lean and efficient they lack resiliency and agility. By having a local source of agricultural goods and food we add resiliency and agility into our own economy and community. The agricultural industry in Jefferson County provides this.

A plethora of scientific studies have shown that a variety of air pollutants produced by the type of industry this zoning change would provide for causes decreased yields of both quantity and quality for several of the crops important to Jefferson County including winter wheat and soybeans. Soybeans and wheat are two of the crops significantly affected and two of the most prevalent crops in Jefferson County. Lower crop yields harm the farms and all the members of the down stream supply chain as well as the consumer.

Recent studies have shown that even small increases in air pollution affect the productivity of agricultural workers. Similar to the reduction in crop yield this will negatively affect the individual workers, businesses, consumers and industry as a whole.

Even more devastating is the possibility of groundwater contamination. The land at the subject location has karst hydrogeology and as such has porous bedrock and severe ground instability problems. The porous bedrock allows rapid diffuse infiltration of surface water into ground water and the severe ground instability problems leads to sinkhole development. Sinkholes provide direct connection of the surface water with the ground water aquifer through point infiltration. In fact, according to a 2012 study by Doctor and Doctor, the subject location and that of Terrapins Neck have the highest sinkhole vulnerability of any sites in Jefferson County. The propensity and easy of diffuse and point infiltration in areas of karst hydrogeology give them very high aquifer vulnerability meaning the aquifer is very vulnerable to contamination. For this reason, this measure has been used for decades by policymakers to set land use regulations.

The WVDEP recognizes development in karst areas puts water resources high-risk for contamination but also recognizes that this is best protected against true local land use and zoning ordinances. WVDEP's guiding document Stormwater Management Design in Karst Areas states, "it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." This document also references the Chesapeake Bay Stormwater Network karst stormwater guidance document the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed. In which it states "...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more

appropriate locations.” Land use policy in Ranson and zoning need to take aquifer vulnerability into consideration as these agencies and documents suggest.

The Jefferson Orchards Voluntary Remediation Plan application reports that the ground water is only 60 feet from the surface at the site. It is described in the scientific literature that this land is an upland plane with large amounts of water in the epikarst, and contamination of this water effects the whole aquifer including the communications with surface water streams. A USGS study demonstrated that the groundwater adjacent to the site communicates readily with several surface water structures and wells miles away from the site. The effects of contamination at this site would go well beyond Ranson fouling large portions of the ground water and surface water in Jefferson County.

Groundwater contamination at the site would have devastating effects on the Agricultural industry in Jefferson county. For geographic and economic reasons it is simply infeasible for the agricultural industry to rely on utility provided water. Based on the scientific literature the site being considered for rezoning is one of the areas of highest aquifer vulnerability in Jefferson County and is inappropriate for the industry that this zoning change will provide for.

The industry that this zoning will provide for will threaten the health, safety, and welfare of the community by threatening the agriculture industry's ability to produce. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Cecelia Heller

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

Having grown up in the Shenandoah Valley of Virginia, visiting Harper's Ferry & Shepherdstown has long been a tradition. These are places where the bucolic scenery meets an incredible history and a rich cultural heritage. The vitality of this area for eco-tourism and other kinds of tourism would adversely impacted by the presence of the industry of Rockwool. I also have many friends in this area and believe they deserve to live unfettered by the pollution this plant would cause to them and their children.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would negatively affect tourism, economic agility, groundwater quality, and individual health in neighboring municipalities like Shepherdstown.

Tourism is critically important to Shepherdstown's economy and to the county as a whole. In 2018, tourist spending in the Jefferson County contributed over \$170 million to state and local government revenue and \$213 million in individual earnings. Importantly, most of this money comes from tourists visiting from neighboring states like Virginia, Maryland, and Washington D.C. Out-of-state tourists are largely drawn to Jefferson County because of its reputation for environmental-friendly, sustainable industry. Key elements that support this reputation include the county's pastoral scenery and pristine natural resources. Ordinance #2017-302 will allow industry into Jefferson County that risks harming these elements and dramatically reducing the area's appeal to visitors. The resulting harm to our tourist industry would drive away visitors and decrease state, county, and local revenue. The long-term success of Jefferson County's tourism industry is dependent on local governments making coordinated zoning decisions. Allowing certain types in industry in Ranson will negatively affect tourism in every municipality throughout the county, including Shepherdstown. Voting no on ordinance #2017-302 will protect the foundations of the county's tourism industry and protect the 7,040 jobs in Jefferson County that are directly supported by tourism.

The type of large, consolidated industry that ordinance #2017-302 would allow in Ranson would generally reduce the flexibility of local economies in Jefferson County. Historically, the driving industries in Jefferson County have been tourism, agriculture, and the equine industries. These three industries are large conglomerates of small businesses. Small business is very important to Sheherdstown. Small businesses have been shown to create more jobs, cultivate more innovation, and provide more opportunities than big, non-local firms. Additionally, small businesses have been shown to more reactive to sudden changes relative to manufacturing

businesses. Bringing large, manufacturing-based industry into Jefferson county will depress the local economy and stifle innovation. During this time of economic upheaval and uncertainty, Jefferson County needs to support industries that will allow local economies to adapt and recover as fast as possible.

Voting no on ordinance #2017-302 will help protect water resources throughout Jefferson County. The type of industry that ordinance #2017-302 would allow puts the ground resources of Jefferson county at significant risk due to the karst hydrogeology. The site in Ranson is in the Rocky Marsh Run watershed, which is in the source water protection zone for Shepherdstown and drains to the Potomac River. Therefore, activity at this site will affect both groundwater and surface water streams. In municipalities like Shepherdstown, many residents and nearby farms depend on wells for water. Contamination of groundwater aquifers would create both health and remediation concerns for local residents. Dye tests performed by the USGS near the area of proposed rezoning in Ranson have shown just how far-reaching groundwater contamination at the Ranson site could be. Results from the USGS study revealed measurable dye concentrations in Elk's Run, Rattlesnake Run, and even the Shepherdstown Town Run. This last run cuts through the center of Shepherdstown and is a favorite area for children to play and learn to fish.

Groundwater pollution is not the only concern for communities like Shepherdstown. The type of industry that ordinance #2017-302 would allow in Ranson would also generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. These pollutants are particularly harmful to children. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. The site in Ranson is across the road from an elementary school and also within the Jefferson High Middle district. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of children in Shepherdstown and all of Jefferson County.

I again request that you vote no on ordinance #2017-302. The long-term economic, environmental, and community health of municipalities like Shepherdstown depend on Ranson's participation in a coordinated zoning plan for all of Jefferson County.

Sincerely,

Jennifer Williams

Voting no on ordinance #2017-302 will protect the foundations of the county's tourism industry and protect the 7,040 jobs in Jefferson County that are directly supported by tourism.

The type of large, consolidated industry that ordinance #2017-302 would allow in Ranson would generally reduce the flexibility of local economies in Jefferson County. Historically, the driving industries in Jefferson County have been tourism, agriculture, and the equine industries. These three industries are large conglomerates of small businesses. Small business is very important to Sheherdstown. Small businesses have been shown to create more jobs, cultivate more innovation, and provide more opportunities than big, non-local firms. Additionally, small businesses have been shown to more reactive to sudden changes relative to manufacturing

businesses. Bringing large, manufacturing-based industry into Jefferson county will depress the local economy and stifle innovation. During this time of economic upheaval and uncertainty, Jefferson County needs to support industries that will allow local economies to adapt and recover as fast as possible.

Voting no on ordinance #2017-302 will help protect water resources throughout Jefferson County. The type of industry that ordinance #2017-302 would allow puts the ground resources of Jefferson county at significant risk due to the karst hydrogeology. The site in Ranson is in the Rocky Marsh Run watershed, which is in the source water protection zone for Shepherdstown and drains to the Potomac River. Therefore, activity at this site will affect both groundwater and surface water streams. In municipalities like Shepherdstown, many residents and nearby farms depend on wells for water. Contamination of groundwater aquifers would create both health and remediation concerns for local residents. Dye tests performed by the USGS near the area of proposed rezoning in Ranson have shown just how far-reaching groundwater contamination at the Ranson site could be. Results from the USGS study revealed measurable dye concentrations in Elk's Run, Rattlesnake Run, and even the Shepherdstown Town Run. This last run cuts through the center of Shepherdstown and is a favorite area for children to play and learn to fish.

Groundwater pollution is not the only concern for communities like Shepherdstown. The type of industry that ordinance #2017-302 would allow in Ranson would also generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. These pollutants are particularly harmful to children. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. The site in Ranson is across the road from an elementary school and also within the Jefferson High Middle district. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of children in Shepherdstown and all of Jefferson County.

I again request that you vote no on ordinance #2017-302. The long-term economic, environmental, and community health of municipalities like Shepherdstown depend on Ranson's participation in a coordinated zoning plan for all of Jefferson County. Please do not destroy one of the last beautiful places left on the area.

Sincerely,

william janes

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

The current pandemic makes even more clear how any pollutants can make the already vulnerable more at risk. As a senior resident of Jefferson county I feel this is a life or death issue.

Sincerely,

James (Jim) McCright
Shepherdstown, 25443

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask that you vote no on Ordinance #2017-302. While not in Ranson, the land and homes around the property that is the subject of the zoning change are closer to the property than anyone who currently lives within the city limits of Ranson. This area will be affected sooner and more harshly by the environmental issues that will develop secondary to the inappropriate siting of industry this zoning would allow.

The subject land has been well studied by Drs. Kozar, Doctor and Doctor and described in the scientific literature and USGS reports as having karst hydrology with very high aquifer vulnerability. The karst landscape is a consequence of the presence of soluble bedrock, which consists of limestone in the case of the subject land. In such landscapes water percolates through the ground and dissolves the underlying rock creating a porous network of caverns and throughways. Karst aquifers are known to be "extremely vulnerable to pollution" due to direct connection between the surface water and groundwater through both point (sinkholes) and diffuse (everywhere) infiltration. It is known from the Voluntary Remediation Plan of Jefferson Orchard that the groundwater at the subject site is only 60 feet below the ground. The subject property and much of the property around it are on an upland plain with few surface streams, but great seasonal variability in the water table resulting in numerous esteves and large amounts of water in the epikarst. This water is easily contaminated and this contamination spreads quickly throughout the aquifer. Dye tests performed near the subject site by the USGS have demonstrated this quick moving thorough dispersment in the aquifer in this area. While this contamination goes on to affect springs at the margins of the upland area continuing on in streams that service municipal water sources and the Potomac River, our concerns are far more immediate in both time and distance. Well water is the only water source available in the area of the proposed zoning change and, with the exception of Fox Glen, a majority of this water is supplied by private wells. Therefore, the groundwater aquifer fulfills a critical necessity, fulfilling all needs including human consumption, household uses, and agriculture and

maintenance of livestock and horses in the immediate area around the site. The concern is that if the aquifer becomes contaminated, then the local drinking water will be fouled.

For decades now, policy makers have been using “Aquifer Vulnerability,” to set land use and water resource protection policy. Karst has very high Aquifer Vulnerability. Therefore, this industrial use is not appropriate for this land and it should not be zoned for it. The guiding documents of the WVDEP recognize this. The introduction to the WVDEP document *Stormwater Management Design in Karst Areas* states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.”

The Chesapeake Bay Stormwater Network karst stormwater guidance document the *CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed*, which the WVDEP cites in its own guiding document *Stormwater Management Design in Karst Areas*, clearly agrees stating

“First, the effect of land development on karst terrain is complex and hard to predict, and requires professional analysis to reduce the risk of geological hazards, damage to infrastructure and groundwater contamination.”

“The working group acknowledges that past approaches to stormwater and land development in karst terrain have been inadequate to safeguard the public and the environment.”

“...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.”

We clearly need stronger comprehensive land use plans and zoning that direct new growth away from karst areas to more appropriate locations. Ordinance #2017-302 is literally the opposite of this.

Further, we cannot rely on the WVDEP to do the job that good local land use guidelines and zoning should do. For example, the *CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed* states that detention and retention ponds are not recommended on karst and categorize them as discouraged. Also, quoting WVDEP’s own karst guidance: “attenuating surface runoff will increase the rate of sinkhole formation and potential groundwater contamination.” Yet the entity currently planning to utilize this zoning change is planning employment of multiple massive retention ponds and attenuating surface runoff completely. This has already been approved by the DEP in two Construction Stormwater General Permit registrations for that company. One of detention ponds is not even regulated by the DEP as it contains process water and has no outlet. Clearly the DEP recognizes the risks but is not appropriately limiting them. Relying on the DEP to protect the public health, safety, welfare, and the environment from any entity in these karst locations is simply as the CNS bulletin said it “inadequate to safeguard the public and the environment.” We must have appropriate zoning that takes into consideration appropriate use of land with karst

hydrogeology. Ordinance #2017-302 does not do this, but instead increases the risk to the public and the environment.

A second serious concern is the air emissions from the industry that this zoning will provide for. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. These types of air emissions have been shown to increase the risk of, contribute to, and exacerbate a multitude of developmental, physical, physiological, physiological, cognitive and economic. The exposure of one individual can cause repercussions in multiple generations. Embryos, fetuses, and children are most vulnerable with effects born out over a lifetime, and that of their offspring. Many of these effects only require short-term exposure and some have even been shown to occur at levels below current limits recommended by the World Health Organization. One example of this is that a recent study found that “Even within the limits set by the World Health Organization, the pollutants PM10, SO₂, NO₂, and O₃ are associated with increased risk of treatment for respiratory diseases in children 0 to 6 years of age.” Unfortunately, the US limits are higher than WHO, 300 % higher in the case of PM10!

In fact, in 2019, in the Advice from the Independent Particulate Matter Review Panel (formerly U.S. EPA Clean Air Scientific Advisory Committee Particulate Matter Review Panel) on EPA’s Policy Assessment for the Review of the National Ambient Air Quality Standards for Particulate Matter, it stated that the committee unanimously and unequivocally found that the current primary annual and 24-hour PM_{2.5} National Ambient Air Quality Standards (NAAQS) are not adequate to protect public health. The advice from this 20-member committee, whose scientific disciplines include epidemiology, medicine, toxicology, air quality measurement, air quality modeling, exposure assessment measurement and modeling, risk assessment, statistics, and others, was ignored due presumably to political pressure. Not only are the NAAQS too high in some cases, but due to the measure and mechanism by which they work, they can not replace the safety provided by good land use and zoning regulations, that are meant to do things like keep factories with air emissions and hundreds of heavy trucks away from elementary schools. In fact, there is a state law that prohibits siting a school near a factory. Unfortunately, the reciprocal law does not exist. Clearly, just like with the water resources, we cannot rely on the DEP or the EPA to do the job of what appropriate zoning should do. The whole point of zoning is to keep people safe and provide for their health and welfare. Ordinance #2017-302 puts families and school children directly in harms way.

The air emissions, threat to the groundwater, and the very presence of the industry that this zoning change will allow for will have a serious negative economic effect on those who live and or work closest to the site in question. Productivity and workforce participation will be negatively affected by the health effects of the air emissions. The local agricultural operations will be negatively affected by the air emissions with lower quantity and quality of crop yield and would be devastated if the ground water aquifer were fouled. The equine operations in the area, of which there are several, will be negatively affected by the air emissions as they affect the horses’ health and performance. The mere presence of the industry that will be provided

for by this zoning change will cause property values to fall. There will be serious economic consequences for the immediate area around the site in question.

Several of the communities in the immediate area of the site for proposed zoning change are traditionally underserved and have lower economic status. The choice of this location for such a zoning change represents an egregious example of environmental injustice that should not be promulgated or tolerated.

This zoning change will provide for industry that will negatively affect the health safety and welfare of our community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Anthony Lowe

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask you to vote NO on Ordinance #2017-302. The industry this zoning change will allow for endangers the health, safety and, welfare of the community, and violates the premise of the smart code zoning that we have spent so much time, effort and federal money employing.

Any change in zoning needs to align with the comprehensive plan. In Ranson's current comprehensive plan (2012), the City only refers to "heavy industry" in the history section. Here it is characterized as part of a bygone era that has been replaced by an emphasis on agriculture for local food production, open spaces, and quality-of-life. In the remainder of the document, the word industry is used loosely to describe businesses including flower shops and shoe stores. Nothing that resembles the industry that this zoning change will provide for is described in the current comprehensive plan of Ranson.

In the land use section of the comprehensive plan, number ten states:

"Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The comprehensive plan clearly states that the city will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community. This change in zoning clearly negatively affects the health, safety, and welfare of the community.

As the zoning is proposed, the industry that this zoning change will allow for will be directly across the street from houses, parks and other small businesses. A densely populated subdivision and an elementary school already exit directly across the street. While these latter

community sections are not in the city limits, the effect of this zoning on them should still be considered just the same as it would be if they were in the city limits.

The industry that this zoning change will provide for will produce particulate, gaseous, and hazardous air emissions. These emissions have been shown to be detrimental to human health at every stage of life from embryo to old age. In utero and childhood exposure are the most damaging with lasting effects being realized through out life, and with maternal exposure the effects can be felt for generations. Multiple organ systems are affected including respiratory, cardiovascular, neurologic, immune, and endocrine causing defects in multiple processes including in utero development, neurodevelopment, immune and tolerance development, and cognitive defects. There are also psychological, social, and economic effects from both perceived and actual air pollution in both children and adults. Many of these effects can be seen even with short-term exposure or exposure that is lower than the levels recommended by the US Environmental Protection Agency and World Health Organization. These consequences are devastating to the individual and depressing to the local community and economy. State law does not allow a school to be built next to industry that this zoning will allow but yet we are contemplating changing the zoning so this industry can build next to a school. This does not make sense. As Ranson residents, we want Ranson to follow the lead of the state and keep polluting industry away from kids. In these ways, this change in zoning will negatively affect the health and welfare of the community.

In addition to the health effects of the air emissions is the threat to groundwater from the industry that this zoning change would allow. The land in question has karst hydrogeology and therefore very high aquifer vulnerability and is not appropriate for this industry. With the type of industry this zoning will provide for, combined with high aquifer vulnerability, the likelihood of groundwater contamination is too high for the community and region to bear. A USGS study demonstrated that contamination in the groundwater adjacent to the site moves relatively quickly and can be found in wells and surface water structures in a variety of locations in the County. In this way, contamination at the site would affect the drinking water of the great majority of Jefferson County residents. Through the surface water connections, the water at the site also affects the water resources of the region.

Aquifer vulnerability has been used by policy makers for decades to set land use regulations. The guiding document, from the WVDEP, *Stormwater Management Design in Karst Areas* states, "it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." In Ranson, we need to follow this advice and not change the zoning of this land for use by industry that has among the highest aquifer vulnerability in the County. This zoning change will endanger the safety of the community and region by endangering the safe water resources. As Ranson residents, we want to safeguard the water resources of the county and region by following the WVDEP guidance here.

Further, by reallocating this transect district and replacing it with a monolithic block of Special District Industrial designation, hundreds of housing units, parks and space for small businesses are lost. Ranson loses the potential for property tax on these properties and their improvements, Business and Occupational tax on the businesses and sales tax in retail stores. The community loses out on the opportunity to develop affordable housing and create locations where people can live, work, play, and shop all in the same place reducing the need for travel.

Worse yet apparently a deal has been made where the entity that owns the subject land has required that a litany of things not be built on the adjacent land essentially stripping the purpose of the smart code transect zone that exists there. Transect zones in the smart code are meant to transition, from out to in, and provide communities where people can safely work and live in close proximity in an effort to reduce travel. Excluding many of the components of the transect zone effectively eliminates the features that make it a transect zone, thus, losing the benefits a transect zone offers the community and city. By losing these benefits, reducing the overall and affordable housing prospects, and reducing so drastically the opportunities for city income, this zoning change will negatively affect the welfare of the community.

As Ranson residents, we find it odd that we are changing zoning to provide for industry that we would not put in the middle of our town close to our residents, but we are placing it close to the homes of county residents. Further, it is striking that the area where this change in zoning is directly adjacent to historically underserved lower income communities and a Title I school. This amounts to environmental injustice and cannot be tolerated.

The purpose of zoning is for a city to protect the health, welfare, morals and safety of the community. In this case, the air emissions and heavy truck traffic will endanger the communities' health. The threat of water contamination will endanger the safety of the community. The effect of lost productivity and decreased workforce participation due to increased illness and the negative effect the air emissions and presence of such a factory will have on the local economy will negatively affect the welfare of the community. The environmental injustice of changing the zoning to accommodate such polluting industry in a location where your municipality has no residents, but yet hundreds of low income and underserved county residents live is egregiously amoral. This must not happen. We respectfully implore you to do the right thing and vote no on ordinance #2017-302.

Sincerely,

Sherrvonne Jones

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

From Randall Tremba, Presbyterian Minister.

I am a Christian pastor. I served the Shepherdstown Presbyterian Church from 1976 to 2017. Forty-one years. My vocation as a pastor was and is to care for the health and well-being of the whole person, including mind, body, and soul. The Rockwool Plant is not only a danger to physical health, it threatens the spiritual well-being of us individually and collectively. It is a blight on the soil and soul of our community. People and councils make mistakes. It's what you do next that reveals true character. Do all you can to repair this injury to the law. Please preserve the soothing pastoral character of our county.

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would negatively affect tourism, economic agility, groundwater quality, and individual health in neighboring municipalities like Shepherdstown.

Tourism is critically important to Shepherdstown's economy and to the county as a whole. In 2018, tourist spending in the Jefferson County contributed over \$170 million to state and local government revenue and \$213 million in individual earnings. Importantly, most of this money comes from tourists visiting from neighboring states like Virginia, Maryland, and Washington D.C. Out-of-state tourists are largely drawn to Jefferson County because of its reputation for environmental-friendly, sustainable industry. Key elements that support this reputation include the county's pastoral scenery and pristine natural resources. Ordinance #2017-302 will allow industry into Jefferson County that risks harming these elements and dramatically reducing the area's appeal to visitors. The resulting harm to our tourist industry would drive away visitors and decrease state, county, and local revenue. The long-term success of Jefferson County's tourism industry is dependent on local governments making coordinated zoning decisions. Allowing certain types in industry in Ranson will negatively affect tourism in every municipality throughout the county, including Shepherdstown. Voting no on ordinance #2017-302 will

protect the foundations of the county's tourism industry and protect the 7,040 jobs in Jefferson County that are directly supported by tourism.

The type of large, consolidated industry that ordinance #2017-302 would allow in Ranson would generally reduce the flexibility of local economies in Jefferson County. Historically, the driving industries in Jefferson County have been tourism, agriculture, and the equine industries. These three industries are large conglomerates of small businesses. Small business is very important to Shepherdstown. Small businesses have been shown to create more jobs, cultivate more innovation, and provide more opportunities than big, non-local firms. Additionally, small businesses have been shown to be more reactive to sudden changes relative to manufacturing businesses. Bringing large, manufacturing-based industry into Jefferson county will depress the local economy and stifle innovation. During this time of economic upheaval and uncertainty, Jefferson County needs to support industries that will allow local economies to adapt and recover as fast as possible.

Voting no on ordinance #2017-302 will help protect water resources throughout Jefferson County. The type of industry that ordinance #2017-302 would allow puts the ground resources of Jefferson county at significant risk due to the karst hydrogeology. The site in Ranson is in the Rocky Marsh Run watershed, which is in the source water protection zone for Shepherdstown and drains to the Potomac River. Therefore, activity at this site will affect both groundwater and surface water streams. In municipalities like Shepherdstown, many residents and nearby farms depend on wells for water. Contamination of groundwater aquifers would create both health and remediation concerns for local residents. Dye tests performed by the USGS near the area of proposed rezoning in Ranson have shown just how far-reaching groundwater contamination at the Ranson site could be. Results from the USGS study revealed measurable dye concentrations in Elk's Run, Rattlesnake Run, and even the Shepherdstown Town Run. This last run cuts through the center of Shepherdstown and is a favorite area for children to play and learn to fish.

Groundwater pollution is not the only concern for communities like Shepherdstown. The type of industry that ordinance #2017-302 would allow in Ranson would also generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. These pollutants are particularly harmful to children. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. The site in Ranson is across the road from an elementary school and also within the Jefferson High Middle district. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of children in Shepherdstown and all of Jefferson County.

I again request that you vote no on ordinance #2017-302. The long-term economic, environmental, and community health of municipalities like Shepherdstown depend on Ranson's participation in a coordinated zoning plan for all of Jefferson County.

Sincerely,

Randall Tremba
Shepherdstown, 25443

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask that you vote no on Ordinance #2017-302. While not in Ranson, the land and homes around the property that is the subject of the zoning change are closer to the property than anyone who currently lives within the city limits of Ranson. This area will be affected sooner and more harshly by the environmental issues that will develop secondary to the inappropriate siting of industry this zoning would allow.

The subject land has been well studied by Drs. Kozar, Doctor and Doctor and described in the scientific literature and USGS reports as having karst hydrology with very high aquifer vulnerability. The karst landscape is a consequence of the presence of soluble bedrock, which consists of limestone in the case of the subject land. In such landscapes water percolates through the ground and dissolves the underlying rock creating a porous network of caverns and throughways. Karst aquifers are known to be "extremely vulnerable to pollution" due to direct connection between the surface water and groundwater through both point (sinkholes) and diffuse (everywhere) infiltration. It is known from the Voluntary Remediation Plan of Jefferson Orchard that the groundwater at the subject site is only 60 feet below the ground. The subject property and much of the property around it are on an upland plain with few surface streams, but great seasonal variability in the water table resulting in numerous esteves and large amounts of water in the epikarst. This water is easily contaminated and this contamination spreads quickly throughout the aquifer. Dye tests performed near the subject site by the USGS have demonstrated this quick moving thorough dispersment in the aquifer in this area. While this contamination goes on to affect springs at the margins of the upland area continuing on in streams that service municipal water sources and the Potomac River, our concerns are far more immediate in both time and distance. Well water is the only water source available in the area of the proposed zoning change and, with the exception of Fox Glen, a majority of this water is supplied by private wells. Therefore, the groundwater aquifer fulfills a critical necessity, fulfilling all needs including human consumption, household uses, and agriculture and

maintenance of livestock and horses in the immediate area around the site. The concern is that if the aquifer becomes contaminated, then the local drinking water will be fouled.

For decades now, policy makers have been using “Aquifer Vulnerability,” to set land use and water resource protection policy. Karst has very high Aquifer Vulnerability. Therefore, this industrial use is not appropriate for this land and it should not be zoned for it. The guiding documents of the WVDEP recognize this. The introduction to the WVDEP document Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.”

The Chesapeake Bay Stormwater Network karst stormwater guidance document the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed, which the WVDEP cites in its own guiding document Stormwater Management Design in Karst Areas, clearly agrees stating:

“First, the effect of land development on karst terrain is complex and hard to predict, and requires professional analysis to reduce the risk of geological hazards, damage to infrastructure and groundwater contamination.” “The working group acknowledges that past approaches to stormwater and land development in karst terrain have been inadequate to safeguard the public and the environment.” “...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” We clearly need stronger comprehensive land use plans and zoning that direct new growth away from karst areas to more appropriate locations. Ordinance #2017-302 is literally the opposite of this.

Further, we cannot rely on the WVDEP to do the job that good local land use guidelines and zoning should do. For example, the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed states that detention and retention ponds are not recommended on karst and categorize them as discouraged. Also, quoting WVDEP’s own karst guidance: “attenuating surface runoff will increase the rate of sinkhole formation and potential groundwater contamination.” Yet the entity currently planning to utilize this zoning change is planning employment of multiple massive retention ponds and attenuating surface runoff completely. This has already been approved by the DEP in two Construction Stormwater General Permit registrations for that company. One of detention ponds is not even regulated by the DEP as it contains process water and has no outlet. Clearly the DEP recognizes the risks but is not appropriately limiting them. Relying on the DEP to protect the public health, safety, welfare, and the environment from any entity in these karst locations is simply as the CNS bulletin said it “inadequate to safeguard the public and the environment.” We must have appropriate zoning that takes into consideration appropriate use of land with karst hydrogeology. Ordinance #2017-302 does not do this, but instead increases the risk to the public and the environment.

A second serious concern is the air emissions from the industry that this zoning will provide for. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. These types of air emissions have been shown to increase the risk of, contribute to, and exacerbate a multitude of developmental, physical, physiological, physiological, cognitive and economic. The exposure of one individual can cause repercussions in multiple generations. Embryos, fetuses, and children are most vulnerable with effects born out over a lifetime, and that of their offspring. Many of these effects only require short-term exposure and some have even been shown to occur at levels below current limits recommended by the World Health Organization. One example of this is that a recent study found that “Even within the limits set by the World Health Organization, the pollutants PM₁₀, SO₂, NO₂, and O₃ are associated with increased risk of treatment for respiratory diseases in children 0 to 6 years of age.” Unfortunately, the US limits are higher than WHO, 300 % higher in the case of PM₁₀!

In fact, in 2019, in the Advice from the Independent Particulate Matter Review Panel (formerly U.S. EPA Clean Air Scientific Advisory Committee Particulate Matter Review Panel) on EPA’s Policy Assessment for the Review of the National Ambient Air Quality Standards for Particulate Matter, it stated that the committee unanimously and unequivocally found that the current primary annual and 24-hour PM_{2.5} National Ambient Air Quality Standards (NAAQS) are not adequate to protect public health. The advice from this 20-member committee, whose scientific disciplines include epidemiology, medicine, toxicology, air quality measurement, air quality modeling, exposure assessment measurement and modeling, risk assessment, statistics, and others, was ignored due presumably to political pressure. Not only are the NAAQS too high in some cases, but due to the measure and mechanism by which they work, they can not replace the safety provided by good land use and zoning regulations, that are meant to do things like keep factories with air emissions and hundreds of heavy trucks away from elementary schools. In fact, there is a state law that prohibits siting a school near a factory. Unfortunately, the reciprocal law does not exist. Clearly, just like with the water resources, we cannot rely on the DEP or the EPA to do the job of what appropriate zoning should do. The whole point of zoning is to keep people safe and provide for their health and welfare. Ordinance #2017-302 puts families and school children directly in harms way.

The air emissions, threat to the groundwater, and the very presence of the industry that this zoning change will allow for will have a serious negative economic effect on those who live and or work closest to the site in question. Productivity and workforce participation will be negatively affected by the health effects of the air emissions. The local agricultural operations will be negatively affected by the air emissions with lower quantity and quality of crop yield and would be devastated if the ground water aquifer were fouled. The equine operations in the area, of which there are several, will be negatively affected by the air emissions as they affect the horses’ health and performance. The mere presence of the industry that will be provided for by this zoning change will cause property values to fall. There will be serious economic consequences for the immediate area around the site in question.

Several of the communities in the immediate area of the site for proposed zoning change are traditionally underserved and have lower economic status. The choice of this location for such a zoning change represents an egregious example of environmental injustice that should not be promulgated or tolerated.

This zoning change will provide for industry that will negatively affect the health safety and welfare of our community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Heavy Industry is way outside the current complexion of the county and this will end up being the moment when we decide whether we want Jefferson County to be a safe, healthy place to live and work. It is a watershed moment - do the right thing and save us from this disaster.

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life, negatively impacting a variety of lifetime parameters, including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces, this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The new industry would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan is clear: The city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Barb Johnson & Minh Le

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that will significantly harm the municipalities within Jefferson County and beyond effecting the health, welfare, and safety of our community. Harpers Ferry is a national treasure with the natural and historic resources tours flock to see each year and one of the communities that will be negatively impacted by this zoning change.

According to a 2019 study by the West Virginia Tourism Office, Jefferson County generated and average of \$178 million per year in tourism-derived revenue for state and local governments over the last 10 years, more than any other county in West Virginia by at least double. Tourism benefits the businesses and economy of Ranson and Jefferson County producing \$213.7 million in individual earning, 7040 jobs, and \$842.6 million in direct spending here in 2018. We would need 40 Project Shuttles to replace the individual earnings and 59 Rockwools to replace the jobs provided by the tourism industry in Jefferson County. It is important to note that most of the money generated by tourism in Jefferson County comes from neighboring states. In this way it is like an export. Not simply recycling money but bringing money into the state increasing its wealth. Much of the economy in Harpers Ferry is based on this tourism industry. A threat to this industry poses a threat to the economy and welfare of our community.

One of the important drivers for tourism in Harpers Ferry is the Appalachian Trail. According to the Appalachian Trail Conservancy (ATC), Harpers Ferry is the psychologic midpoint of the Trail, and Hikers often plan extended stays in Jefferson County with an obvious positive impact. The ATC reports that the smokestacks and associated lights will be visible in the view shed of 15 vistas on the Appalachian Trail (AT). Studies have shown that quality of vistas and human impact on the environment are not only noticed by visitors but effect their experience. Another study published in the Journal of Applied Recreation Research, found that points of interests and views drew visitors' attention and had a significant impact on their perception of the trail. It was also found that particularly beautiful vistas helped visitors overlook elements that usually

have a negative effect on trail experience like increased trail traffic. A 2009 study in Leisure Sciences revealed that scenic value was a perceptual theme of Appalachian Trail visitors, and that things as simple as dead trees visible in a vista can have a negative impact on visitors overall perception. Imagine the effect the smokestacks will have from the 15 vistas from which they will be visible. The introduction of industrial activity made possible by the proposed rezoning in Ranson would have a negative effect on the scenic views of beautiful landscapes from the Appalachian Trail in Jefferson County.

The smokestacks are not all visitors will be able to see, the air pollution will create haze. The effect of regional haze on tourists was explored in a review article published in the *Atmospheric Environment* titled "Impaired visibility: the air pollution people see." A key takeaway on the negative affect of haze on vacationing tourists was summarized as follows: "Vacations offer an escape from the routine and stress of our daily lives. Vacation destinations are often chosen based on their scenery; vacations are spent gazing at monuments, mountains, clouds, and oceans. Good visibility allows clear observation of distant features and appreciation of the inherent beauty of these scenes...Air pollution, which is often present in both our cities and parks, interferes with these attributes and can ruin the views vacationers travel to enjoy." People seek bucolic, unspoiled areas to escape the stresses of urban areas. A 2004 study in *Environment and Behavior* found Perceived pollution causes stress while viewing natural scenes has both psychological and physiological benefits, and a 2007 study confirmed these benefits. Two other studies found that people are emotionally affected by poor visibility, and tourists are disappointed when views are obscured by haze. The combination of smokestacks and haze will mar the viewshed and will not only reduce the positive effects of a scenic landscape but also leave tourists disappointed and dissatisfied with their choice of destination. With these effects the welfare of the Harpers Ferry community would undoubtedly be endangered by the industry that this zoning change will provide for.

Multiple studies by doctors Kozar, Doctor, and Doctor have demonstrated that the land at this site to be rezoned is Karst with the highest likelihood of sinkhole development in the county, and that the ground water aquifer there is incredibly sensitive to contamination from surface water. Further, this site is on an upland plain with relatively few surface streams, seasonal variability in the water table that results in numerous estavelles, and large amounts of water in the epikarst. In this area contamination in surface water communicates easily to the water in the epikarst via diffuse and point infiltration, and the springs at the margins of the upland area are directly affected by the water quality throughout the aquifer. According to Jefferson Orchards Voluntary Remediation Plan with the WVDEP, the ground water at the site is approximately 60 feet below the ground, and the tests performed by the USGS have shown that ground water from just adjacent to this site emerged in the headwaters of both the Elk's Run and Rattlesnake Run. This is critically important for Harpers Ferry because the Elk's Run headwaters is a spring about three miles south east of the site and goes on to become the drinking water source for Harpers Ferry and Bolivar before emptying into the Potomac River. The headwaters of Rattlesnake Run is a spring about 3.5 miles from the site and is also a tributary of the Potomac River. The Potomac River is the back up water source for Harpers Ferry. This means that the activity at the site will have a critical influence on the drinking water

of Harpers Ferry. In this was the industry permitted by this change in zoning would undoubtedly endanger the health and safety of the community in Harpers Ferry.

The untoward health effects and individual economic consequences from the pollution emissions of the industry this rezoning will allow that will be born out over the length of peoples lives and that of their decedents for at least 3 generations is an egregious example of environmental injustice that should not be tolerated. This zoning change may be in one of the poorest sections of the county but the effects will be felt in every part of Ranson and the county.

The Comprehensive plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” The industry that this rezoning will allow will jeopardize the health, safety and welfare of Ranson, Harpers Ferry and the whole county. Please vote no on the ordinance #2017-302.

Sincerely,

Barbara Brown

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on Ordinance #2017-302. Ranson's proposed zoning change presents a significant risk to the equine industry in Jefferson County and well beyond. The type of industry that would be allowed by the proposed zoning change in this location would jeopardize horse health, the groundwater supply, and workforce productivity. This will cause immediate shrinkage and threaten the long-term viability of the equine industry in the county.

The site of the proposed rezoning is less than six miles from Charles Town Races, with several breeding, training, and rehabilitation facilities between the two. The industry allowed by this rezoning would produce particulate, gaseous, and hazardous air emissions that would reach these sites. According to the WVDEP air permit, the Rockwool plant in Ranson is permitted to emit 250.87 tons of particulate matter per year into the air (1).

According to a recent study published in the journal of Veterinary Internal Medicine (2), horses are 15 times more sensitive to inhaled particulate matter than humans. Inhaled particulate matter can cause inflammation in horses' lungs that negatively affects performance. Inhaled particulate matter also contributes to the development of inflammatory airway disease (IAD) (3). IAD is a chronic airway disease that can affect horses long after their racing career is over. While there is little research on how other air pollutants affect horses, the effects of pollution on humans can be used to infer potential impact on horses. However unlike human models, these horses are elite athletes continuously exposed, and will thus likely experience detrimental effects at much lower levels of air pollution than humans.

The primary concern with air pollution is that increased levels of pollutants will increase inflammation in horses' lungs. Even small, subclinical amounts of inflammation in the lungs of horses negatively affect performance (2,3,4,5,6,11). This inflammation can also cause increased recovery times following racing (7,11). Reduced performance and training interruptions can lead to higher risk of injury, reduced winning average, fewer yearly starts, lower yearly

earnings, shortened career length, fewer lifetime starts, reduced lifetime earnings, and reduced quality of life (2,3,8,9,11). Each of these situations will lead to decreased return on investment, decreased cash flow, and decreased overall earnings for owners, trainers, and breeders with horses at Charles Town Races and in nearby areas.

While racing is usually a thoroughbred's first career, it is rarely their last. Some racing horses go on to be breeding stock, while others will have successful careers as sport horses. Jefferson County is an important source of new stock for sport horse trainers from Northern Virginia, and Maryland, and this is a resource for local horseman of both income and placement for horses not appropriate for breeding. However, if retired racehorses are unsound from injury or respiratory disease, they can be difficult to manage as breeding stock or unfit for a career as a sport horse. This affects the horse's quality of life and also places a burden on the industry locally and regionally.

The perception of decreased air quality from the increase in regional haze and visible smokestacks as one drives into the county will deter out of state owners and breeders from investing in West Virginia bred Race horses, decreasing or eliminating a critical \$50 million a year source of local business volume.

Another concern related to the proposed rezoning in Ranson is the risk of groundwater contamination as a result of the karst hydrogeology at the site and the industrial activity. Horsemen will either have to take on the expense of periodically testing water sources or they may not know local ground water is contaminated until their animals are sick. Veterinary care and testing adds expense and uncertainty to an industry that already deals with large inherent risks. The actual occurrence of ground water contamination would be devastating for Jefferson County's equine industry. For both geographic and financial reasons, it is simply impossible to think that the industry could solely use public or private utility-provided water if industrial activity fouled the local groundwater.

Finally, studies on US agricultural workers have demonstrated that increased air pollution decreases productivity of outdoors workers. This would place an additional burden on workers, small business owners and the industry.

The equine industry in Jefferson County is hundreds of years old. It is not worth risking this historic and economically valuable industry by rezoning for industrial companies like Rockwool. An economic impact study of the Charles Town Thoroughbred Horse Racing Industry on Jefferson County's economy found that the spending by owners, breeders, and trainers of the equine industry directly contributes \$79.4 million to the county each year. Out-of-state owners, breeders, and trainers spend more than \$50 million in Jefferson County every year. The value of total business volume in Jefferson County is \$191 million each year (10). These numbers do not include the effect of the handle or the casino.

The equine industry provides jobs for a broad cross-section of the public. This industry offers individuals of any educational background a variety of paths to achieve a good middle-income

living. Many jobs allow individuals to pursue apprenticeships or on-the-job training rather than requiring a costly college education. This flexibility allows for greater lifetime earnings and improved educational debt-to-earnings ratio for these workers. The equine industry also provides opportunities for non-traditional workers by offering job opportunities to those who may not be employable by larger corporations. This industry provides a variety of full-time, part-time, flexible, and pick-up work. Encouraging this type of flexible job ecosystem helps create a healthy economy with broad participation in employment and consumption.

The equine industry is a large conglomerate of small businesses, which have a multitude of economic benefits over having a few large businesses. It has been extensively reported that small locally owned businesses and start ups create more jobs, cultivate innovation, generate higher incomes, and provide more opportunities for individuals that would otherwise not exist than big non-local firms, which can actually depress local economies. The equine industry provides opportunities for small businesses and startups responsible for this growth of better jobs that are so good for the economy.

The equine industry offers so many other benefits that the industry in the rezoned area would not. For example, the equine industry supports local agriculture by providing a market for agricultural goods such as straw. The robust straw market supported by owners, trainers, and breeders allows for a third cash crop to be produced from one field in a year. Through pastureland and support of local agricultural goods, the equine industry protects and preserves the open spaces that give our county its bucolic quality and help attract tourists. Through the breeders' incentive programs, the equine industry offers unique opportunities to draft state funds back to Jefferson County, to name a few.

Rezoning this area of Ranson for Special District Industrial will allow in entities whose activities are harmful to the equine industry. The losses incurred by the equine industry would far outweigh any benefits derived from industries occupying the rezoned area. Sacrificing the long-term viability of one of our oldest and most productive industries for a net loss in business volume and economic value just does not make good sense for the local economy. Please vote NO on Ordinance #2017-302.

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask that you vote no on Ordinance #2017-302. While not in Ranson, the land and homes around the property that is the subject of the zoning change are closer to the property than anyone who currently lives within the city limits of Ranson. This area will be affected sooner and more harshly by the environmental issues that will develop secondary to the inappropriate siting of industry this zoning would allow.

The subject land has been well studied by Drs. Kozar, Doctor and Doctor and described in the scientific literature and USGS reports as having karst hydrology with very high aquifer vulnerability. The karst landscape is a consequence of the presence of soluble bedrock, which consists of limestone in the case of the subject land. In such landscapes water percolates through the ground and dissolves the underlying rock creating a porous network of caverns and throughways. Karst aquifers are known to be "extremely vulnerable to pollution" due to direct connection between the surface water and groundwater through both point (sinkholes) and diffuse (everywhere) infiltration. It is known from the Voluntary Remediation Plan of Jefferson Orchard that the groundwater at the subject site is only 60 feet below the ground. The subject property and much of the property around it are on an upland plain with few surface streams, but great seasonal variability in the water table resulting in numerous esteves and large amounts of water in the epikarst. This water is easily contaminated and this contamination spreads quickly throughout the aquifer. Dye tests performed near the subject site by the USGS have demonstrated this quick moving thorough dispersment in the aquifer in this area. While this contamination goes on to affect springs at the margins of the upland area continuing on in streams that service municipal water sources and the Potomac River, our concerns are far more immediate in both time and distance. Well water is the only water source available in the area of the proposed zoning change and, with the exception of Fox Glen, a majority of this water is supplied by private wells. Therefore, the groundwater aquifer fulfills a critical necessity, fulfilling all needs including human consumption, household uses, and agriculture and

maintenance of livestock and horses in the immediate area around the site. The concern is that if the aquifer becomes contaminated, then the local drinking water will be fouled.

For decades now, policy makers have been using “Aquifer Vulnerability,” to set land use and water resource protection policy. Karst has very high Aquifer Vulnerability. Therefore, this industrial use is not appropriate for this land and it should not be zoned for it. The guiding documents of the WVDEP recognize this. The introduction to the WVDEP document *Stormwater Management Design in Karst Areas* states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.”

The Chesapeake Bay Stormwater Network karst stormwater guidance document the *CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed*, which the WVDEP cites in its own guiding document *Stormwater Management Design in Karst Areas*, clearly agrees stating

“First, the effect of land development on karst terrain is complex and hard to predict, and requires professional analysis to reduce the risk of geological hazards, damage to infrastructure and groundwater contamination.”

“The working group acknowledges that past approaches to stormwater and land development in karst terrain have been inadequate to safeguard the public and the environment.”

“...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.”

We clearly need stronger comprehensive land use plans and zoning that direct new growth away from karst areas to more appropriate locations. Ordinance #2017-302 is literally the opposite of this.

Further, we cannot rely on the WVDEP to do the job that good local land use guidelines and zoning should do. For example, the *CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed* states that detention and retention ponds are not recommended on karst and categorize them as discouraged. Also, quoting WVDEP’s own karst guidance: “attenuating surface runoff will increase the rate of sinkhole formation and potential groundwater contamination.” Yet the entity currently planning to utilize this zoning change is planning employment of multiple massive retention ponds and attenuating surface runoff completely. This has already been approved by the DEP in two Construction Stormwater General Permit registrations for that company. One of detention ponds is not even regulated by the DEP as it contains process water and has no outlet. Clearly the DEP recognizes the risks but is not appropriately limiting them. Relying on the DEP to protect the public health, safety, welfare, and the environment from any entity in these karst locations is simply as the CNS bulletin said it “inadequate to safeguard the public and the environment.” We must have appropriate zoning that takes into consideration appropriate use of land with karst

hydrogeology. Ordinance #2017-302 does not do this, but instead increases the risk to the public and the environment.

A second serious concern is the air emissions from the industry that this zoning will provide for. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. These types of air emissions have been shown to increase the risk of, contribute to, and exacerbate a multitude of developmental, physical, physiological, physiological, cognitive and economic. The exposure of one individual can cause repercussions in multiple generations. Embryos, fetuses, and children are most vulnerable with effects born out over a lifetime, and that of their offspring. Many of these effects only require short-term exposure and some have even been shown to occur at levels below current limits recommended by the World Health Organization. One example of this is that a recent study found that “Even within the limits set by the World Health Organization, the pollutants PM10, SO₂, NO₂, and O₃ are associated with increased risk of treatment for respiratory diseases in children 0 to 6 years of age.” Unfortunately, the US limits are higher than WHO, 300 % higher in the case of PM10!

In fact, in 2019, in the Advice from the Independent Particulate Matter Review Panel (formerly U.S. EPA Clean Air Scientific Advisory Committee Particulate Matter Review Panel) on EPA’s Policy Assessment for the Review of the National Ambient Air Quality Standards for Particulate Matter, it stated that the committee unanimously and unequivocally found that the current primary annual and 24-hour PM_{2.5} National Ambient Air Quality Standards (NAAQS) are not adequate to protect public health. The advice from this 20-member committee, whose scientific disciplines include epidemiology, medicine, toxicology, air quality measurement, air quality modeling, exposure assessment measurement and modeling, risk assessment, statistics, and others, was ignored due presumably to political pressure. Not only are the NAAQS too high in some cases, but due to the measure and mechanism by which they work, they can not replace the safety provided by good land use and zoning regulations, that are meant to do things like keep factories with air emissions and hundreds of heavy trucks away from elementary schools. In fact, there is a state law that prohibits siting a school near a factory. Unfortunately, the reciprocal law does not exist. Clearly, just like with the water resources, we cannot rely on the DEP or the EPA to do the job of what appropriate zoning should do. The whole point of zoning is to keep people safe and provide for their health and welfare. Ordinance #2017-302 puts families and school children directly in harms way.

The air emissions, threat to the groundwater, and the very presence of the industry that this zoning change will allow for will have a serious negative economic effect on those who live and or work closest to the site in question. Productivity and workforce participation will be negatively affected by the health effects of the air emissions. The local agricultural operations will be negatively affected by the air emissions with lower quantity and quality of crop yield and would be devastated if the ground water aquifer were fouled. The equine operations in the area, of which there are several, will be negatively affected by the air emissions as they affect the horses’ health and performance. The mere presence of the industry that will be provided

for by this zoning change will cause property values to fall. There will be serious economic consequences for the immediate area around the site in question.

Several of the communities in the immediate area of the site for proposed zoning change are traditionally underserved and have lower economic status. The choice of this location for such a zoning change represents an egregious example of environmental injustice that should not be promulgated or tolerated.

This zoning change will provide for industry that will negatively affect the health safety and welfare of our community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Stephen Parker

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on #2017-302. The air emissions, possibility of ground and surface water contamination, and their effect on our interwoven economies threaten the health, safety and welfare of not just Jefferson County but the greater region, including Loudoun and the greater Northern Virginia area.

This zoning would provide for industry that produces large amounts of air emissions. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. Northern Virginia is directly downwind from these emissions. Much of the gaseous, fine particulate, and hazardous emissions can reach Northern Virginia. Further affecting the outdoor air quality of the adjacent portion of Virginia and the ability of these areas to achieve and maintain National Ambient Air Quality Standards (NAAQS) attainment. This will affect agriculture and outdoor leisure and recreation.

For example, Loudoun County has been in nonattainment for the NAAQS 8-hour Ozone standard for the past two years. VOC and NO_x react after they have been emitted to produce ground level ozone. The industry that this rezoning would provide for would produce large amounts of these emissions. This would make it even harder as Loudoun County tries to achieve attainment. As time goes on and the scientific research advances our knowledge and understanding of the extent to which gaseous, particulate and hazardous emissions affect human health the NAAQS standards are likely to be reduced. The effects on air emission from this rezoning will make it only harder for Loudoun and Northern Virginia to meet these standards.

In addition to the concerns about the air, the possible ground and surface water contamination is very concerning to Loudoun and Virginia residents. The site is known to have ground water that is vulnerable to contamination due to the karst hydrogeology. A USGS study demonstrated that the ground water adjacent to the site to be rezoned communicates readily with surface

water tributaries of the Potomac River. In addition to direct infiltration where water moves directly from the surface to groundwater via porous limestone bedrock, karst is known to have severe ground instability problems. This makes karst geology prone to sinkhole development. Sinkholes provide direct connection between the surface water and any contaminants it may contain and the groundwater. This makes the aquifer vulnerability in karst areas very high, and contamination with industrial activity such as that provided for by this rezoning too likely.

Loudoun sources its drinking water from the Potomac River, downstream of many West Virginia tributaries that carry water from the epikarst and groundwater aquifer at the site to be rezoned. Loudoun has recently completed the new Trap Rock Water Treatment facility, which draws water from the Potomac River. Loudoun currently provides 40 million gallons and projects to provide 90 million gallons of drinking water a day to customers by 2040 (Loudounwater.org). Therefore, the viability of the Potomac River is a high priority for Virginia residents.

Loudoun and Northern Virginia is one of the fastest growing communities in the country and provides a lot to Jefferson County in their symbiotic relationship. Virginia residents support and enjoy Jefferson County through tourism, as our residents enjoy the natural and historical resources of your county. Virginia residents and businesses support the equine industry in a multitude of ways from providing wagering fans at the races to the Virginia Breeders Association Virginia Certified incentive programs and a strong market for retired racehorses. According to an economic impact study from WVU, at least 40% of Jefferson County residents travel outside of West Virginia for work, a good percentage of those travel to northern Virginia. This rezoning would allow for industry that would negatively affect the economy of both places and this relationship and the benefits for our residents gleaned from it.

This zoning change will provide for industry that will negatively effect the health safety and welfare of the Loudon and Northern Virginia community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Julie Reiter

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Dan Zugay, property owner

Subject: Written Public Comment for hearing on #2017-302

Dear Ranson City Officials,

I implore you to seize this opportunity to protect Jefferson County's children and families from the harmful air and water pollutants created by the Rockwool company. Please vote no on ordinance #2017-302. Stopping heavy industry in Jefferson County - particularly industry situated so very close to thousands of vulnerable school children - is the moral and ethical course of action.

In addition to the health risks for children and families, the economic fallout from the finalization and opening of this Rockwool plant will be incredibly detrimental to our entire region. Falling property values, decreased tourism, impacts on agriculture, our local university system etc will assuredly lead to decreased revenue to Jefferson County and to WV as a whole. None of these costs are worth an entity who will be paying no taxes for years and who is offering a few meager jobs in exchange for an enormous amount of collateral damage to our community's health, sky and water.

Now is the time to correct the mistakes of the past. Please, for the sake of Jefferson County and all of its citizens, I implore you to vote no on ordinance #2017-302.

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that will significantly harm the municipalities within Jefferson County and beyond effecting the health, welfare, and safety of our community. Harpers Ferry is a national treasure with the natural and historic resources tours flock to see each year and one of the communities that will be negatively impacted by this zoning change.

According to a 2019 study by the West Virginia Tourism Office, Jefferson County generated an average of \$178 million per year in tourism-derived revenue for state and local governments over the last 10 years, more than any other county in West Virginia by at least double. Tourism benefits the businesses and economy of Ranson and Jefferson County producing \$213.7 million

in individual earning, 7040 jobs, and \$842.6 million in direct spending here in 2018. We would need 40 Project Shuttles to replace the individual earnings and 59 Rockwools to replace the jobs provided by the tourism industry in Jefferson County. It is important to note that most of the money generated by tourism in Jefferson County comes from neighboring states. In this way, it is like an export: not simply recycling money, but bringing money into the state increasing its wealth. Much of the economy in Harpers Ferry is based on this tourism industry. A threat to this industry poses a threat to the economy and welfare of our community.

One of the important drivers for tourism in Harpers Ferry is the Appalachian Trail. According to the Appalachian Trail Conservancy (ATC), Harpers Ferry is the psychologic midpoint of the Trail, and hikers often plan extended stays in Jefferson County with an obvious positive impact. The ATC reports that the smokestacks and associated lights will be visible in the viewshed of 15 vistas on the Appalachian Trail (AT). Studies have shown that quality of vistas and human impact on the environment are not only noticed by visitors, but effect their experience. Another study published in the Journal of Applied Recreation Research, found that points of interests and views drew visitors' attention and had a significant impact on their perception of the trail. It was also found that particularly beautiful vistas helped visitors overlook elements that usually have a negative effect on trail experience like increased trail traffic. A 2009 study in Leisure Sciences revealed that scenic value was a perceptual theme of Appalachian Trail visitors, and that things as simple as dead trees visible in a vista can have a negative impact on visitors' overall perception. Imagine the effect the smokestacks will have from the 15 vistas from which they will be visible. The introduction of industrial activity made possible by the proposed rezoning in Ranson would have a negative effect on the scenic views of beautiful landscapes from the Appalachian Trail in Jefferson County.

The smokestacks are not all visitors will be able to see — the air pollution will create haze. The effect of regional haze on tourists was explored in a review article published in the Atmospheric Environment titled "Impaired visibility: the air pollution people see." A key takeaway on the negative affect of haze on vacationing tourists was summarized as follows:

"Vacations offer an escape from the routine and stress of our daily lives. Vacation destinations are often chosen based on their scenery; vacations are spent gazing at monuments, mountains, clouds, and oceans. Good visibility allows clear observation of distant features and appreciation of the inherent beauty of these scenes...Air pollution, which is often present in both our cities and parks, interferes with these attributes and can ruin the views vacationers travel to enjoy."

People seek bucolic, unspoiled areas to escape the stresses of urban areas. A 2004 study in Environment and Behavior found perceived pollution causes stress while viewing natural scenes has both psychological and physiological benefits, and a 2007 study confirmed these benefits. Two other studies found that people are emotionally affected by poor visibility, and tourists are disappointed when views are obscured by haze.

The combination of smokestacks and haze will mar the viewshed and will not only reduce the positive effects of a scenic landscape but also leave tourists disappointed and dissatisfied with

their choice of destination. With these effects the welfare of the Harpers Ferry community would undoubtedly be endangered by the industry that this zoning change will provide for.

Multiple studies by doctors Kozar, Doctor, and Doctor have demonstrated that the land at this site to be rezoned is Karst with the highest likelihood of sinkhole development in the county, and that the groundwater aquifer there is incredibly sensitive to contamination from surface water. Further, this site is on an upland plain with relatively few surface streams, seasonal variability in the water table that results in numerous estavelles, and large amounts of water in the epikarst. In this area contamination in surface water communicates easily to the water in the epikarst via diffuse and point infiltration, and the springs at the margins of the upland area are directly affected by the water quality throughout the aquifer. According to Jefferson Orchards Voluntary Remediation Plan with the WVDEP, the groundwater at the site is approximately 60 feet below the ground, and the tests performed by the USGS have shown that groundwater from just adjacent to this site emerged in the headwaters of both the Elk's Run and Rattlesnake Run. This is critically important for Harpers Ferry because the Elk's Run headwaters is a spring about three miles southeast of the site and goes on to become the drinking water source for Harpers Ferry and Bolivar before emptying into the Potomac River. The headwaters of Rattlesnake Run is a spring about 3.5 miles from the site and is also a tributary of the Potomac River. The Potomac River is the back up water source for Harpers Ferry. This means that the activity at the site will have a critical influence on the drinking water of Harpers Ferry. In this was the industry permitted by this change in zoning would undoubtedly endanger the health and safety of the community in Harpers Ferry.

The untoward health effects and individual economic consequences from the pollution emissions of the industry this rezoning will allow that will be born out over the length of people's lives and that of their decedents for at least three generations is an egregious example of environmental injustice that should not be tolerated. This zoning change may be in one of the poorest sections of the county, but the effects will be felt in every part of Ranson and the county.

The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." The industry that this rezoning will allow will jeopardize the health, safety and welfare of Ranson, Harpers Ferry and the whole county. Please vote no on the ordinance #2017-302.

Sincerely,

Christal Hanson

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on #2017-302. The air emissions, possibility of ground and surface water contamination, and their effect on our interwoven economies threaten the health, safety and welfare of not just Jefferson County but the greater region, including Loudoun and the greater Northern Virginia area.

This zoning would provide for industry that produces large amounts of air emissions. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. Northern Virginia is directly downwind from these emissions. Much of the gaseous, fine particulate, and hazardous emissions can reach Northern Virginia. Further affecting the outdoor air quality of the adjacent portion of Virginia and the ability of these areas to achieve and maintain National Ambient Air Quality Standards (NAAQS) attainment. This will affect agriculture and outdoor leisure and recreation.

For example, Loudoun County has been in nonattainment for the NAAQS 8-hour Ozone standard for the past two years. VOC and NO_x react after they have been emitted to produce ground level ozone. The industry that this rezoning would provide for would produce large amounts of these emissions. This would make it even harder as Loudoun County tries to achieve attainment. As time goes on and the scientific research advances our knowledge and understanding of the extent to which gaseous, particulate and hazardous emissions affect human health the NAAQS standards are likely to be reduced. The effects on air emission from this rezoning will make it only harder for Loudoun and Northern Virginia to meet these standards.

In addition to the concerns about the air, the possible ground and surface water contamination is very concerning to Loudoun and Virginia residents. The site is known to have ground water that is vulnerable to contamination due to the karst hydrogeology. A USGS study demonstrated that the ground water adjacent to the site to be rezoned communicates readily with surface

water tributaries of the Potomac River. In addition to direct infiltration where water moves directly from the surface to groundwater via porous limestone bedrock, karst is known to have severe ground instability problems. This makes karst geology prone to sinkhole development. Sinkholes provide direct connection between the surface water and any contaminants it may contain and the groundwater. This makes the aquifer vulnerability in karst areas very high, and contamination with industrial activity such as that provided for by this rezoning too likely.

Loudoun sources its drinking water from the Potomac River, downstream of many West Virginia tributaries that carry water from the epikarst and groundwater aquifer at the site to be rezoned. Loudoun has recently completed the new Trap Rock Water Treatment facility, which draws water from the Potomac River. Loudoun currently provides 40 million gallons and projects to provide 90 million gallons of drinking water a day to customers by 2040 (Loudounwater.org). Therefore, the viability of the Potomac River is a high priority for Virginia residents.

Loudoun and Northern Virginia is one of the fastest growing communities in the country and provides a lot to Jefferson County in their symbiotic relationship. Virginia residents support and enjoy Jefferson County through tourism, as our residents enjoy the natural and historical resources of your county. Virginia residents and businesses support the equine industry in a multitude of ways from providing wagering fans at the races to the Virginia Breeders Association Virginia Certified incentive programs and a strong market for retired racehorses. According to an economic impact study from WVU, at least 40% of Jefferson County residents travel outside of West Virginia for work, a good percentage of those travel to northern Virginia. This rezoning would allow for industry that would negatively affect the economy of both places and this relationship and the benefits for our residents gleaned from it.

This zoning change will provide for industry that will negatively effect the health safety and welfare of the Loudon and Northern Virginia community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

John Whitaker

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The city has failed to address the latter part of this objective. By Changing the SDI in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and child hood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health, and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and overall earnings for owners, breeders, and

trainers. This group provides over 70 million dollars in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. This industry would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitorship and again decreasing return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up this industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the Karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive plan is clear the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Alena Sweigart

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would have a negative effect on water and air quality in neighboring states such as Maryland.

The Potomac River provides drinking water and a source of recreation to Maryland residents. Water and air pollution generated within the Potomac River's watershed will inevitably contaminate this valuable waterway. The site of the proposed zoning change in Ranson is located within the Potomac River Watershed.

The type of industry that ordinance #2017-30 would allow in Ranson would generate large quantities of wastewater, stored on-site, in an area of known karst terrain. The West Virginia Department of Environmental Protection has published guidelines that specifically discourage extensive development in areas of karst terrain because of the vulnerability of karst aquifers to contamination by surface pollution. Karst features increase surface water and groundwater connectivity and any spills or surface releases quickly percolate into the groundwater. Additionally, sinkholes are common in karst terrain and can cause ruptures in wastewater impoundments. Even if appropriate attempts are made to contain and manage wastewater and other stormwater runoff on-site, there is still a high risk that wastewater could contaminate the groundwater through tears and catastrophic failure of wastewater impoundments. Contaminated groundwater in karst terrain can easily resurface in waterways several miles away, as shown by a USGS tracer study conducted near the site in Ranson. The USGS study detected tracer dye in multiple springs and waterways miles from the initial injection site in Ranson. All of these waterways drain into the Potomac River.

Mismanagement of wastewater could also lead to contamination of nearby surface waters. For example, the site of the proposed rezoning in Ranson is in the Rocky Marsh Run watershed. Rocky Marsh Run also drains to the Potomac River. Voting no on ordinance #2017-30 will

preserve downstream water quality and ensure that the Potomac River remains usable for Maryland residents.

Air pollution poses another risk to Maryland residents. The type of industry that ordinance #2017-302 would allow would generate air pollutants like fine particulate matter. According to the US EPA, fine particulates can travel 100s of miles from its original source. Air pollution related to industrial activity in Ranson could easily reach Maryland. Fine particulates have a greater affinity for carrying toxic compounds and their small size allows them to be inhaled more deeply into the lungs. Chronic exposure to fine particulate matter is associated with increased risk of Alzheimer's in adults. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. Fine particulate matter also exacerbates regional haze which creates a visible reminder of air pollution. The psychological effects that arise from an increased perception of pollution include stress, anxiety, and unhappiness. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of Maryland residents.

I again request that you vote no on ordinance #2017-302. Zoning decisions in Ranson and Jefferson County have an undeniable influence on the quality of life in neighboring states.

Sincerely,

Stephanie Felton

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that will significantly harm the municipalities within Jefferson County and beyond effecting the health, welfare, and safety of our community. Harpers Ferry is a national treasure with the natural and historic resources tours flock to see each year and one of the communities that will be negatively impacted by this zoning change.

According to a 2019 study by the West Virginia Tourism Office, Jefferson County generated an average of \$178 million per year in tourism-derived revenue for state and local governments over the last 10 years, more than any other county in West Virginia by at least double. Tourism benefits the businesses and economy of Ranson and Jefferson County producing \$213.7 million in individual earning, 7040 jobs, and \$842.6 million in direct spending here in 2018. We would need 40 Project Shuttles to replace the individual earnings and 59 Rockwools to replace the jobs provided by the tourism industry in Jefferson County. It is important to note that most of the money generated by tourism in Jefferson County comes from neighboring states. In this way, it is like an export: not simply recycling money, but bringing money into the state increasing its wealth. Much of the economy in Harpers Ferry is based on this tourism industry. A threat to this industry poses a threat to the economy and welfare of our community.

One of the important drivers for tourism in Harpers Ferry is the Appalachian Trail. According to the Appalachian Trail Conservancy (ATC), Harpers Ferry is the psychologic midpoint of the Trail, and hikers often plan extended stays in Jefferson County with an obvious positive impact. The ATC reports that the smokestacks and associated lights will be visible in the viewshed of 15 vistas on the Appalachian Trail (AT). Studies have shown that quality of vistas and human impact on the environment are not only noticed by visitors, but effect their experience. Another study published in the Journal of Applied Recreation Research, found that points of interests and views drew visitors' attention and had a significant impact on their perception of the trail. It was also found that particularly beautiful vistas helped visitors overlook elements

that usually have a negative effect on trail experience like increased trail traffic. A 2009 study in Leisure Sciences revealed that scenic value was a perceptual theme of Appalachian Trail visitors, and that things as simple as dead trees visible in a vista can have a negative impact on visitors' overall perception. Imagine the effect the smokestacks will have from the 15 vistas from which they will be visible. The introduction of industrial activity made possible by the proposed rezoning in Ranson would have a negative effect on the scenic views of beautiful landscapes from the Appalachian Trail in Jefferson County.

The smokestacks are not all visitors will be able to see — the air pollution will create haze. The effect of regional haze on tourists was explored in a review article published in the Atmospheric Environment titled "Impaired visibility: the air pollution people see." A key takeaway on the negative affect of haze on vacationing tourists was summarized as follows:

"Vacations offer an escape from the routine and stress of our daily lives. Vacation destinations are often chosen based on their scenery; vacations are spent gazing at monuments, mountains, clouds, and oceans. Good visibility allows clear observation of distant features and appreciation of the inherent beauty of these scenes...Air pollution, which is often present in both our cities and parks, interferes with these attributes and can ruin the views vacationers travel to enjoy."

People seek bucolic, unspoiled areas to escape the stresses of urban areas. A 2004 study in Environment and Behavior found perceived pollution causes stress while viewing natural scenes has both psychological and physiological benefits, and a 2007 study confirmed these benefits. Two other studies found that people are emotionally affected by poor visibility, and tourists are disappointed when views are obscured by haze.

The combination of smokestacks and haze will mar the viewshed and will not only reduce the positive effects of a scenic landscape but also leave tourists disappointed and dissatisfied with their choice of destination. With these effects the welfare of the Harpers Ferry community would undoubtedly be endangered by the industry that this zoning change will provide for.

Multiple studies by doctors Kozar, Doctor, and Doctor have demonstrated that the land at this site to be rezoned is Karst with the highest likelihood of sinkhole development in the county, and that the groundwater aquifer there is incredibly sensitive to contamination from surface water. Further, this site is on an upland plain with relatively few surface streams, seasonal variability in the water table that results in numerous estavelles, and large amounts of water in the epikarst. In this area contamination in surface water communicates easily to the water in the epikarst via diffuse and point infiltration, and the springs at the margins of the upland area are directly affected by the water quality throughout the aquifer. According to Jefferson Orchards Voluntary Remediation Plan with the WVDEP, the groundwater at the site is approximately 60 feet below the ground, and the tests performed by the USGS have shown that groundwater from just adjacent to this site emerged in the headwaters of both the Elk's Run and Rattlesnake Run. This is critically important for Harpers Ferry because the Elk's Run headwaters is a spring about three miles southeast of the site and goes on to become the drinking water source for Harpers Ferry and Bolivar before emptying into the Potomac River.

The headwaters of Rattlesnake Run is a spring about 3.5 miles from the site and is also a tributary of the Potomac River. The Potomac River is the back up water source for Harpers Ferry. This means that the activity at the site will have a critical influence on the drinking water of Harpers Ferry. In this was the industry permitted by this change in zoning would undoubtedly endanger the health and safety of the community in Harpers Ferry.

The untoward health effects and individual economic consequences from the pollution emissions of the industry this rezoning will allow that will be born out over the length of people's lives and that of their decedents for at least three generations is an egregious example of environmental injustice that should not be tolerated. This zoning change may be in one of the poorest sections of the county, but the effects will be felt in every part of Ranson and the county.

In addition to the above the impact on the adjoining roads and the twenty four hour a day operation would have a devastating impact on the community. The constant noise and light pollution of a heavy industry operation would forever change the quality of life for our community.

The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." The industry that this rezoning will allow will jeopardize the health, safety and welfare of Ranson, Harpers Ferry and the whole county. Please vote no on the ordinance #2017-302.

Sincerely,

Douglas Allmond

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The city has failed to address the latter part of this objective. By Changing the SDI in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and child hood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health, and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and overall earnings for owners, breeders, and

trainers. This group provides over 70 million dollars in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. This industry would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitorship and again decreasing return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up this industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the Karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive plan is clear the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Dorothy Lanahan

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The city has failed to address the latter part of this objective. By Changing the SDI in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and child hood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health, and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and overall earnings for owners, breeders, and

trainers. This group provides over 70 million dollars in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. This industry would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitorship and again decreasing return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up this industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the Karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive plan is clear the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would have a negative effect on water and air quality in neighboring states such as Maryland.

The Potomac River provides drinking water and a source of recreation to Maryland residents. Water and air pollution generated within the Potomac River's watershed will inevitably contaminate this valuable waterway. The site of the proposed zoning change in Ranson is located within the Potomac River Watershed.

The type of industry that ordinance #2017-30 would allow in Ranson would generate large quantities of wastewater, stored on-site, in an area of known karst terrain. The West Virginia Department of Environmental Protection has published guidelines that specifically discourage extensive development in areas of karst terrain because of the vulnerability of karst aquifers to contamination by surface pollution. Karst features increase surface water and groundwater connectivity and any spills or surface releases quickly percolate into the groundwater. Additionally, sinkholes are common in karst terrain and can cause ruptures in wastewater impoundments. Even if appropriate attempts are made to contain and manage wastewater and other stormwater runoff on-site, there is still a high risk that wastewater could contaminate the groundwater through tears and catastrophic failure of wastewater impoundments. Contaminated groundwater in karst terrain can easily resurface in waterways several miles away, as shown by a USGS tracer study conducted near the site in Ranson. The USGS study detected tracer dye in multiple springs and waterways miles from the initial injection site in Ranson. All of these waterways drain into the Potomac River.

Mismanagement of wastewater could also lead to contamination of nearby surface waters. For example, the site of the proposed rezoning in Ranson is in the Rocky Marsh Run watershed. Rocky Marsh Run also drains to the Potomac River. Voting no on ordinance #2017-30 will

preserve downstream water quality and ensure that the Potomac River remains usable for Maryland residents.

Air pollution poses another risk to Maryland residents. The type of industry that ordinance #2017-302 would allow would generate air pollutants like fine particulate matter. According to the US EPA, fine particulates can travel 100s of miles from its original source. Air pollution related to industrial activity in Ranson could easily reach Maryland. Fine particulates have a greater affinity for carrying toxic compounds and their small size allows them to be inhaled more deeply into the lungs. Chronic exposure to fine particulate matter is associated with increased risk of Alzheimer's in adults. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. Fine particulate matter also exacerbates regional haze which creates a visible reminder of air pollution. The psychological effects that arise from an increased perception of pollution include stress, anxiety, and unhappiness. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of Maryland residents.

I again request that you vote no on ordinance #2017-302. Zoning decisions in Ranson and Jefferson County have an undeniable influence on the quality of life in neighboring states.

Sincerely,

margaret stambaugh

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

This zoning change will provide for industry that will negatively affect the agriculture industry in Jefferson County and beyond. The combination of the air emissions and threat to the ground water resources could have devastating consequences for the agricultural community of Jefferson County.

The agriculture industry in Jefferson County is hundreds of years old and continues to serve our community well today. According to the economic impact study "A Shared Agenda for Growing West Virginia's Agricultural Economy, Prepared by Fourth Economy for West Virginia Department Of Agriculture West Virginia University Extension Service 2012," Jefferson County is the second highest producing county for crops sales, third highest for fruits and vegetables sales, and in the top 9 counties for sales of animals and animal products.

Agriculture, tourism and the equine industries work synergistically to have an outsized positive impact on the economy in Ranson and Jefferson County as a whole. Agriculture drives tourism by creating agro-tourism opportunities, preserving beautiful open spaces that contribute to the bucolic nature of our county, and providing the locally produced agriculture goods many tourists are look for in our markets and restaurants. Agriculture also supports the equine industry by providing local products like hay and straw, helping maintain pasture land, co-supporting local dual-purpose retail stores, and helping recycle by products. Agriculture helps maintain the way of life that many those who choose to live in Jefferson County enjoy. Industrial manufacturing and industry this zoning will provide for could never achieve these things.

Local agriculture also provides a source of locally produced agricultural goods. It has become apparent with the current pandemic and health emergency. This became a supply chain crisis because as our supply chains have moved to be ever more lean and efficient they lack resiliency and agility. By having a local source of agricultural goods and food we add resiliency and agility

into our own economy and community. The agricultural industry in Jefferson County provides this.

A plethora of scientific studies have shown that a variety of air pollutants produced by the type of industry this zoning change would provide for causes decreased yields of both quantity and quality for several of the crops important to Jefferson County including winter wheat and soybeans. Soybeans and wheat are two of the crops significantly affected and two of the most prevalent crops in Jefferson County. Lower crop yields harm the farms and all the members of the down stream supply chain as well as the consumer.

Recent studies have shown that even small increases in air pollution affect the productivity of agricultural workers. Similar to the reduction in crop yield this will negatively affect the individual workers, businesses, consumers and industry as a whole.

Even more devastating is the possibility of groundwater contamination. The land at the subject location has karst hydrogeology and as such has porous bedrock and severe ground instability problems. The porous bedrock allows rapid diffuse infiltration of surface water into ground water and the severe ground instability problems leads to sinkhole development. Sinkholes provide direct connection of the surface water with the ground water aquifer through point infiltration. In fact, according to a 2012 study by Doctor and Doctor, the subject location and that of Terrapins Neck have the highest sinkhole vulnerability of any sites in Jefferson County. The propensity and easy of diffuse and point infiltration in areas of karst hydrogeology give them very high aquifer vulnerability meaning the aquifer is very vulnerable to contamination. For this reason, this measure has been used for decades by policymakers to set land use regulations.

The WVDEP recognizes development in car karst areas puts water resources high-risk for contamination but also recognizes that this is best protected against true local land use and zoning ordinances. WVDEP's guiding document *Stormwater Management Design in Karst Areas* states, "it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." This document also references the Chesapeake Bay Stormwater Network karst stormwater guidance document the *CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed*. In which it states "...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." Land use policy in Ranson and zoning need to take aquifer vulnerability into consideration as these agencies and documents suggest.

The Jefferson Orchards Voluntary Remediation Plan application reports that the ground water is only 60 feet from the surface at the site. It is described in the scientific literature that this land is an upland plane with large amounts of water in the epikarst, and contamination of this

water effects the whole aquifer including the communications with surface water streams. A USGS study demonstrated that the groundwater adjacent to the site communicates readily with several surface water structures and wells miles away from the site. The effects of contamination at this site would go well beyond Ranson fouling large portions of the ground water and surface water in Jefferson County.

Groundwater contamination at the site would have devastating effects on the Agricultural industry in Jefferson county. For geographic and economic reasons it is simply infeasible for the agricultural industry to rely on utility provided water. Based on the scientific literature the site being considered for rezoning is one of the areas of highest aquifer vulnerability in Jefferson County and is inappropriate for the industry that this zoning change will provide for.

By threatening the local agricultural industry, the industry that this zoning will provide for will threaten the health, safety, and welfare of the community. The Comprehensive Plan in Ranson is clear the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Timothy Lanahan

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

We had seriously considered a Shepherdstown retirement. We would bring community volunteerism and financial support including taxes with no children in the school system. Shepherdstown is one of the most beautiful locations in this entire region. Heavy industry is a short sighted and grievous mistake for the environment and financial future of Jefferson County and West Virginia.

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would negatively affect tourism, economic agility, groundwater quality, and individual health in neighboring municipalities like Shepherdstown.

Tourism is critically important to Shepherdstown's economy and to the county as a whole. In 2018, tourist spending in the Jefferson County contributed over \$170 million to state and local government revenue and \$213 million in individual earnings. Importantly, most of this money comes from tourists visiting from neighboring states like Virginia, Maryland, and Washington D.C. Out-of-state tourists are largely drawn to Jefferson County because of its reputation for environmental-friendly, sustainable industry. Key elements that support this reputation include the county's pastoral scenery and pristine natural resources. Ordinance #2017-302 will allow industry into Jefferson County that risks harming these elements and dramatically reducing the area's appeal to visitors. The resulting harm to our tourist industry would drive away visitors and decrease state, county, and local revenue. The long-term success of Jefferson County's tourism industry is dependent on local governments making coordinated zoning decisions. Allowing certain types in industry in Ranson will negatively affect tourism in every municipality throughout the county, including Shepherdstown. Voting no on ordinance #2017-302 will protect the foundations of the county's tourism industry and protect the 7,040 jobs in Jefferson County that are directly supported by tourism.

The type of large, consolidated industry that ordinance #2017-302 would allow in Ranson would generally reduce the flexibility of local economies in Jefferson County. Historically, the driving industries in Jefferson County have been tourism, agriculture, and the equine industries. These three industries are large conglomerates of small businesses. Small business is very important to Shepherdstown. Small businesses have been shown to create more jobs, cultivate more innovation, and provide more opportunities than big, non-local firms. Additionally, small businesses have been shown to be more reactive to sudden changes relative to manufacturing businesses. Bringing large, manufacturing-based industry into Jefferson county will depress the local economy and stifle innovation. During this time of economic upheaval and uncertainty, Jefferson County needs to support industries that will allow local economies to adapt and recover as fast as possible.

Voting no on ordinance #2017-302 will help protect water resources throughout Jefferson County. The type of industry that ordinance #2017-302 would allow puts the ground resources of Jefferson county at significant risk due to the karst hydrogeology. The site in Ranson is in the Rocky Marsh Run watershed, which is in the source water protection zone for Shepherdstown and drains to the Potomac River. Therefore, activity at this site will affect both groundwater and surface water streams. In municipalities like Shepherdstown, many residents and nearby farms depend on wells for water. Contamination of groundwater aquifers would create both health and remediation concerns for local residents. Dye tests performed by the USGS near the area of proposed rezoning in Ranson have shown just how far-reaching groundwater contamination at the Ranson site could be. Results from the USGS study revealed measurable dye concentrations in Elk's Run, Rattlesnake Run, and even the Shepherdstown Town Run. This last run cuts through the center of Shepherdstown and is a favorite area for children to play and learn to fish.

Groundwater pollution is not the only concern for communities like Shepherdstown. The type of industry that ordinance #2017-302 would allow in Ranson would also generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. These pollutants are particularly harmful to children. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. The site in Ranson is across the road from an elementary school and also within the Jefferson High Middle district. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of children in Shepherdstown and all of Jefferson County.

I again request that you vote no on ordinance #2017-302. The long-term economic, environmental, and community health of municipalities like Shepherdstown depend on Ranson's participation in a coordinated zoning plan for all of Jefferson County.

Sincerely,

Anne Griffiths

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The city has failed to address the latter part of this objective. By Changing the SDI in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and child hood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health, and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and overall earnings for owners, breeders, and

trainers. This group provides over 70 million dollars in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. This industry would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitorship and again decreasing return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up this industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the Karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive plan is clear the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Alessandra Arciprete
