Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that will significantly harm the municipalities within Jefferson County and beyond effecting the health, welfare, and safety of our community. Harpers Ferry is a national treasure with the natural and historic resources tours flock to see each year and one of the communities that will be negatively impacted by this zoning change.

As a neighbor just over the state line in VA, we regularly host visitors who seek out Harpers Ferry, the Appalachian Trail, and the many scenic, beautiful outdoor amenities in Jefferson County. We have so enjoyed being able to share such a beautiful part of the country with our friends & family.

Placing an industrial zone with unsightly smokestacks spewing ever increasing amounts of hazardous chemicals into this area will eliminate our seeking out Jefferson County as a destination to bring guests. Our family is not alone in this decision. The tourism dollars lost to this plan will be vast. Those decision makers responsible for the loss of this industry will be used as an example to teach what not to do to bring strong business development to a community. This will instead bring the demise of a brilliant business minded community. The small business growth will stop and the businesses that remain will be sentenced to a struggle for survival. Good, vibrant small business districts do not seek to be adjacent to an industrial park. The beautiful small businesses are the heart of your community and a wonderful resource and attraction in their own right. Why would you not choose to support your neighbors in service of such a vibrant and prosperous tourism industry?

According to a 2019 study by the West Virginia Tourism Office, Jefferson County generated an average of \$178 million per year in tourism-derived revenue for state and local governments over the last 10 years, more than any other county in West Virginia by at least double. Tourism benefits the businesses and economy of Ranson and Jefferson County producing \$213.7 million

in individual earning, 7040 jobs, and \$842.6 million in direct spending here in 2018. We would need 40 Project Shuttles to replace the individual earnings and 59 Rockwools to replace the jobs provided by the tourism industry in Jefferson County. It is important to note that most of the money generated by tourism in Jefferson County comes from neighboring states. In this way, it is like an export: not simply recycling money, but bringing money into the state increasing its wealth. Much of the economy in Harpers Ferry is based on this tourism industry. A threat to this industry poses a threat to the economy and welfare of our community.

One of the important drivers for tourism in Harpers Ferry is the Appalachian Trail. According to the Appalachian Trail Conservancy (ATC), Harpers Ferry is the psychologic midpoint of the Trail, and hikers often plan extended stays in Jefferson County with an obvious positive impact. The ATC reports that the smokestacks and associated lights will be visible in the viewshed of 15 vistas on the Appalachian Trail (AT). Studies have shown that quality of vistas and human impact on the environment are not only noticed by visitors, but effect their experience. Another study published in the Journal of Applied Recreation Research, found that points of interests and views drew visitors' attention and had a significant impact on their perception of the trail. It was also found that particularly beautiful vistas helped visitors overlook elements that usually have a negative effect on trail experience like increased trail traffic. A 2009 study in Leisure Sciences revealed that scenic value was a perceptual theme of Appalachian Trail visitors, and that things as simple as dead trees visible in a vista can have a negative impact on visitors' overall perception. Imagine the effect the smokestacks will have from the 15 vistas from which they will be visible. The introduction of industrial activity made possible by the proposed rezoning in Ranson would have a negative effect on the scenic views of beautiful landscapes from the Appalachian Trail in Jefferson County.

The smokestacks are not all visitors will be able to see — the air pollution will create haze. The effect of regional haze on tourists was explored in a review article published in the Atmospheric Environment titled "Impaired visibility: the air pollution people see." A key takeaway on the negative affect of haze on vacationing tourists was summarized as follows:

"Vacations offer an escape from the routine and stress of our daily lives. Vacation destinations are often chosen based on their scenery; vacations are spent gazing at monuments, mountains, clouds, and oceans. Good visibility allows clear observation of distant features and appreciation of the inherent beauty of these scenes...Air pollution, which is often present in both our cities and parks, interferes with these attributes and can ruin the views vacationers travel to enjoy."

People seek bucolic, unspoiled areas to escape the stresses of urban areas. A 2004 study in Environment and Behavior found perceived pollution causes stress while viewing natural scenes has both psychological and physiological benefits, and a 2007 study confirmed these benefits. Two other studies found that people are emotionally affected by poor visibility, and tourists are disappointed when views are obscured by haze.

The combination of smokestacks and haze will mar the viewshed and will not only reduce the positive effects of a scenic landscape but also leave tourists disappointed and dissatisfied with

their choice of destination. With these effects the welfare of the Harpers Ferry community would undoubtedly be endangered by the industry that this zoning change will provide for.

Multiple studies by doctors Kozar, Doctor, and Doctor have demonstrated that the land at this site to be rezoned is Karst with the highest likelihood of sinkhole development in the county, and that the groundwater aquifer there is incredibly sensitive to contamination from surface water. Further, this site is on an upland plain with relatively few surface streams, seasonal variability in the water table that results in numerous estavelles, and large amounts of water in the epikarst. In this area contamination in surface water communicates easily to the water in the epikarst via diffuse and point infiltration, and the springs at the margins of the upland area are directly affected by the water quality throughout the aquifer. According to Jefferson Orchards Voluntary Remediation Plan with the WVDEP, the groundwater at the site is approximately 60 feet below the ground, and the tests performed by the USGS have shown that groundwater from just adjacent to this site emerged in the headwaters of both the Elk's Run and Rattlesnake Run. This is critically important for Harpers Ferry because the Elk's Run headwaters is a spring about three miles southeast of the site and goes on to become the drinking water source for Harpers Ferry and Bolivar before emptying into the Potomac River. The headwaters of Rattlesnake Run is a spring about 3.5 miles from the site and is also a tributary of the Potomac River. The Potomac River is the back up water source for Harpers Ferry. This means that the activity at the site will have a critical influence on the drinking water of Harpers Ferry. In this was the industry permitted by this change in zoning would undoubtedly endanger the health and safety of the community in Harpers Ferry.

The untoward health effects and individual economic consequences from the pollution emissions of the industry this rezoning will allow that will be born out over the length of people's lives and that of their decedents for at least three generations is an egregious example of environmental injustice that should not be tolerated. This zoning change may be in one of the poorest sections of the county, but the effects will be felt in every part of Ranson and the county.

The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." The industry that this rezoning will allow will jeopardize the health, safety and welfare of Ranson, Harpers Ferry and the whole county. Please vote no on the ordinance #2017-302.

Sincerely,

Kate Davinroy

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. As someone who lives downwind of this planned area, I am concerned that it will destroy Loudoun's rural industries, pollute our air and cause my asthma to worsen. There is no excuse to doing this to your own citizens and the citizens who live nearby. This is an outrage.

This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would

clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, "the City will designate ample land that is well-suited for industrial facilities." This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Margaret McElligott

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Big industry is not appropriate for this part of the country. Economic development can be achieved by preserving wild and wonderful West Virginia

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would negatively affect tourism, economic agility, groundwater quality, and individual health in neighboring municipalities like Shepherdstown. In doing these things the industry that this zoning change provides for will adversely affect the health, safety, and welfare of our community.

Tourism is critically important to Shepherdstown's economy and to the county as a whole. In 2018, tourist spending in the Jefferson County contributed over \$170 million to state and local government revenue and \$213 million in individual earnings. Importantly, most of this money comes from tourists visiting from neighboring states like Virginia, Maryland, and Washington D.C. Out-of-state tourists are largely drawn to Jefferson County because of its reputation for environmental-friendly, sustainable industry. Key elements that support this reputation include the county's pastoral scenery and pristine natural resources. Ordinance #2017-302 will allow industry into Jefferson County that risks harming these elements and dramatically reducing the area's appeal to visitors. The resulting harm to our tourist industry would drive away visitors and decrease state, county, and local revenue. The long-term success of Jefferson County's tourism industry is dependent on local governments making coordinated zoning decisions. Allowing certain types in industry in Ranson will negatively affect tourism in every municipality throughout the county, including Shepherdstown. Voting no on ordinance #2017-302 will protect the foundations of the county's tourism industry and protect the 7,040 jobs in Jefferson County that are directly supported by tourism. In this way the industry this zoning change will allow will adversely affect the welfare of our community.

The type of large, consolidated industry that ordinance #2017-302 would allow in Ranson would generally reduce the flexibility of local economies in Jefferson County. Historically, the driving industries in Jefferson County have been tourism, agriculture, and the equine industries. These three industries are large conglomerates of small businesses. Small business is very important to Shepherdstown. Small businesses have been shown to create more jobs, cultivate more innovation, and provide more opportunities than big, non-local firms. Additionally, small businesses have been shown to be more reactive to sudden changes relative to manufacturing businesses. Bringing large, manufacturing-based industry into Jefferson county will depress the local economy and stifle innovation. During this time of economic upheaval and uncertainty, Jefferson County needs to support industries that will allow local economies to adapt and recover as fast as possible.

Voting no on ordinance #2017-302 will help protect water resources throughout Jefferson County. The type of industry that ordinance #2017-302 would allow puts the ground resources of Jefferson county at significant risk due to the karst hydrogeology. The site in Ranson is in the Rocky Marsh Run watershed, which is in the source water protection zone for Shepherdstown and drains to the Potomac River. Therefore, activity at this site will affect both groundwater and surface water streams. In municipalities like Shepherdstown, many residents and nearby farms depend on wells for water. Contamination of groundwater aquifers would create both health and remediation concerns for local residents. Dye tests performed by the USGS near the area of proposed rezoning in Ranson have shown just how far-reaching groundwater contamination at the Ranson site could be. Results from the USGS study revealed measurable dye concentrations in Elk's Run, Rattlesnake Run, and even the Shepherdstown Town Run. This last run cuts through the center of Shepherdstown and is a favorite area for children to play and learn to fish. In this way, the industry that this zoning change will allow will adversely affect the safety of our community.

Groundwater pollution is not the only concern for communities like Shepherdstown. The type of industry that ordinance #2017-302 would allow in Ranson would also generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. These pollutants are particularly harmful to children. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. The site in Ranson is across the road from an elementary school and also within the Jefferson High Middle district. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of children in Shepherdstown and all of Jefferson County. In this way, the industry that this zoning change will provide for will adversely affect the health of our community.

I again request that you vote no on ordinance #2017-302. This zoning change will allow industry that will adversely affect the health, safety, and welfare of our community. The long-term economic, environmental, and community health of municipalities like Shepherdstown depend on Ranson's participation in a coordinated zoning plan for all of Jefferson County.

Sincerely,

Karen Henry

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Scott Sellers

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote NO on Ordinance #2017-302. This rezoning will put an undue hardship on the wastewater treatment systems, burden the rate payers and risk surface waterways in Charles Town, risking the health, safety and welfare of the community. The comprehensive plan of Ranson states, the City "will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community." Therefore, please vote NO on #2017-302.

The nature of the industry that this zoning will allow will be harmful to our local economy. Charles Town has spent a lot of time and money improving our downtown area for restaurants and retail. We are working to take advantage of the tourism industry in our county and bring more people into Charles Town. The eye sore, noise pollution, air pollution, and obvious move away from sustainability will drive people away from Jefferson County and Charles Town, rendering our efforts ineffective and unrewarding. This will make it harder for our small businesses to be successful. In this way, the industry this zoning will provide for will adversely affect the welfare of our community.

According to the 2018 WVU economic study of the eastern panhandle, over 40% of the workforce in Jefferson County choose to work outside of the state. These commuters bring that money home and spend it here supporting our local small businesses, economy and government. Charles Town has a large number of residents who commute. These typically higher earners may choose to leave the area because of the presence of the industry that this zoning change would provide for. This will cause a hardship on our economy and municipality. In this way, the industry this zoning will provide for will adversely affect the welfare of our community.

The industry that this zoning will allow will cause stress for multiple reasons on the Charles Town wastewater treatment systems and the surface waterways in Jefferson County and

beyond. The industry currently planning to utilize the zoning change will have discharge to the wastewater system that is high in chloride, primarily from its water softening system. The NPDES permit modification allows up to 5,000 mg/L. Chloride is not settled or removed at the wastewater treatment plant. It cannot be removed by conventional means and would be prohibitively expensive to do by new technology. This is of concern to Charles Town because chloride can harm stream water and also impair functioning of the wastewater treatment plant. Furthermore, the corrosive nature of chloride can cause damage to pipes both in the wastewater system and those used by downstream drinking water systems, like the \$207 million Trap Rock Water Treatment plant in Loudoun.

The human health criteria for chloride under WV standards is 250 mg/L. Under low stream flow conditions, chloride additions to the treatment plant effluent, as proposed by the industry currently planning to utilize the zoning change, could cause chloride levels in Evitts Run to exceed this standard. If the amount of chloride increased due to expansion or higher throughput, then this human health standard would be violated frequently. Chlorides are also known to harm aquatic life and effect metal toxicity in rivers. The USEPA and several states have surface water guidelines of 230mg/L for chronic exposure. This would also pose a risk of damaging the water treatment facilities downstream on the Potomac River.

A research study by Lefebvre and Moletta in 2006 showed that chloride and salinity impair the ability of wastewater treatment to remove phosphorus and nitrogen, and because of this, other states have introduced legislation to treat saline wastewater. Uygur and Kargi in 2004 looked at the effects of salt on synthetic wastewater treatment. They found that removal of both nitrogen and phosphorus was reduced when salinity increased from 0 to 6%. In fact, the removal efficiency of ammonia dropped from 96% to 39% with this increasing salinity. Hong et al. In 2016 found phosphorous removal decreased 20-28% when chloride concentrations went from 150 mg/L to 1,500 mg/L. Phosphorous removal was completely inhibited at concentrations greater than 2,500 mg/L. This increased salinity has the potential to make the Charles Town wastewater treatment system work far less efficiently.

In addition to the contents of the wastewater this type of industry will produce, the volume of sewage is itself a concern. Given that the City of Charles Town has been in violation of its permit on numerous occasions for spills and overflow of untreated sewage, adding large volumes of wastewater will further challenge the near capacity system. This will mean that costly capacity upgrades will need to be done likely sooner than they would have needed to be done, imposing further financial strain on the system. Through these effects, the industry this zoning will provide for will adversely effect the health, safety, and welfare of the community.

This zoning change will provide for industry the likes of which are not present in this county and have not been present in this county for many decades. We find it appalling that the introduction of zoning for such industry is being done in an area of the county that is historically underserved and lower income. It is even more egregious because the worst effects including air pollution and groundwater contamination will be felt first and most severely in the immediate vicinity, and Ranson does not even have residents in the immediate vicinity of the

proposed zoning change. This decision is being contemplated without representation of those who will be most affected. This would be a deplorable example of environmental injustice.

This zoning will provide for industry that will harm our economy, drive away residents, challenge and or damage our infrastructure, and may damage our waterways and wild life. Through these effects, the industry this zoning would allow will adversely effect the health, safety, and welfare of our community. This is being done with out representation of those it will affect the most. Please vote No on Ordinance #2017-302.

Sincerely,

Jack Thomas

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask that you vote no on Ordinance #2017-302. While not in Ranson, the land and homes around the property that is the subject of the zoning change are closer to the property than anyone who currently lives within the city limits of Ranson. This area will be affected sooner and more harshly by the environmental issues that will develop secondary to the inappropriate siting of industry this zoning would allow.

The subject land has been well studied by Drs. Kozar, Doctor and Doctor and described in the scientific literature and USGS reports as having karst hydrology with very high aquifer vulnerability. The karst landscape is a consequence of the presence of soluble bedrock, which consists of limestone in the case of the subject land. In such landscapes water percolates through the ground and dissolves the underlying rock creating a porous network of caverns and throughways. Karst aquifers are known to be "extremely vulnerable to pollution" due to direct connection between the surface water and groundwater through both point (sinkholes) and diffuse (everywhere) infiltration. It is known from the Voluntary Remediation Plan of Jefferson Orchard that the groundwater at the subject site is only 60 feet below the ground. The subject property and much of the property around it are on an upland plain with few surface streams, but great seasonal variability in the water table resulting in numerous esteves and large amounts of water in the epikarst. This water is easily contaminated and this contamination spreads quickly throughout the aquifer. Dye tests performed near the subject site by the USGS have demonstrated this quick moving thorough dispersment in the aquifer in this area. While this contamination goes on to affect springs at the margins of the upland area continuing on in streams that service municipal water sources and the Potomac River, our concerns are far more immediate in both time and distance. Well water is the only water source available in the area of the proposed zoning change and, with the exception of Fox Glen, a majority of this water is supplied by private wells. Therefore, the groundwater aquifer fulfills a critical necessity, fulfilling all needs including human consumption, household uses, and agriculture and

maintenance of livestock and horses in the immediate area around the site. The concern is that if the aquifer becomes contaminated, then the local drinking water will be fouled.

For decades now, policy makers have been using “Aquifer Vulnerability,” to set land use and water resource protection policy. Karst has very high Aquifer Vulnerability. Therefore, this industrial use is not appropriate for this land and it should not be zoned for it. The guiding documents of the WVDEP recognize this. The introduction to the WVDEP document Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.”

The Chesapeake Bay Stormwater Network karst stormwater guidance document the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed, which the WVDEP cites in its own guiding document Stormwater Management Design in Karst Areas, clearly agrees stating:

“First, the effect of land development on karst terrain is complex and hard to predict, and requires professional analysis to reduce the risk of geological hazards, damage to infrastructure and groundwater contamination.” “The working group acknowledges that past approaches to stormwater and land development in karst terrain have been inadequate to safeguard the public and the environment.” “...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” We clearly need stronger comprehensive land use plans and zoning that direct new growth away from karst areas to more appropriate locations. Ordinance #2017-302 is literally the opposite of this.

Further, we cannot rely on the WVDEP to do the job that good local land use guidelines and zoning should do. For example, the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed states that detention and retention ponds are not recommended on karst and categorize them as discouraged. Also, quoting WVDEP’s own karst guidance: “attenuating surface runoff will increase the rate of sinkhole formation and potential groundwater contamination.” Yet the entity currently planning to utilize this zoning change is planning employment of multiple massive retention ponds and attenuating surface runoff completely. This has already been approved by the DEP in two Construction Stormwater General Permit registrations for that company. One of detention ponds is not even regulated by the DEP as it contains process water and has no outlet. Clearly the DEP recognizes the risks but is not appropriately limiting them. Relying on the DEP to protect the public health, safety, welfare, and the environment from any entity in these karst locations is simply as the CNS bulletin said it “inadequate to safeguard the public and the environment.” We must have appropriate zoning that takes into consideration appropriate use of land with karst hydrogeology. Ordinance #2017-302 does not do this, but instead increases the risk to the public and the environment.

A second serious concern is the air emissions from the industry that this zoning will provide for. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. These types of air emissions have been shown to increase the risk of, contribute to, and exacerbate a multitude of developmental, physical, physiological, physiological, cognitive and economic. The exposure of one individual can cause repercussions in multiple generations. Embryos, fetuses, and children are most vulnerable with effects born out over a lifetime, and that of their offspring. Many of these effects only require short-term exposure and some have even been shown to occur at levels below current limits recommended by the World Health Organization. One example of this is that a recent study found that “Even within the limits set by the World Health Organization, the pollutants PM₁₀, SO₂, NO₂, and O₃ are associated with increased risk of treatment for respiratory diseases in children 0 to 6 years of age.” Unfortunately, the US limits are higher than WHO, 300 % higher in the case of PM₁₀!

In fact, in 2019, in the Advice from the Independent Particulate Matter Review Panel (formerly U.S. EPA Clean Air Scientific Advisory Committee Particulate Matter Review Panel) on EPA’s Policy Assessment for the Review of the National Ambient Air Quality Standards for Particulate Matter, it stated that the committee unanimously and unequivocally found that the current primary annual and 24-hour PM_{2.5} National Ambient Air Quality Standards (NAAQS) are not adequate to protect public health. The advice from this 20-member committee, whose scientific disciplines include epidemiology, medicine, toxicology, air quality measurement, air quality modeling, exposure assessment measurement and modeling, risk assessment, statistics, and others, was ignored due presumably to political pressure. Not only are the NAAQS too high in some cases, but due to the measure and mechanism by which they work, they can not replace the safety provided by good land use and zoning regulations, that are meant to do things like keep factories with air emissions and hundreds of heavy trucks away from elementary schools. In fact, there is a state law that prohibits siting a school near a factory. Unfortunately, the reciprocal law does not exist. Clearly, just like with the water resources, we cannot rely on the DEP or the EPA to do the job of what appropriate zoning should do. The whole point of zoning is to keep people safe and provide for their health and welfare. Ordinance #2017-302 puts families and school children directly in harms way.

The air emissions, threat to the groundwater, and the very presence of the industry that this zoning change will allow for will have a serious negative economic effect on those who live and or work closest to the site in question. Productivity and workforce participation will be negatively affected by the health effects of the air emissions. The local agricultural operations will be negatively affected by the air emissions with lower quantity and quality of crop yield and would be devastated if the ground water aquifer were fouled. The equine operations in the area, of which there are several, will be negatively affected by the air emissions as they affect the horses’ health and performance. The mere presence of the industry that will be provided for by this zoning change will cause property values to fall. There will be serious economic consequences for the immediate area around the site in question.

Several of the communities in the immediate area of the site for proposed zoning change are traditionally underserved and have lower economic status. The choice of this location for such a zoning change represents an egregious example of environmental injustice that should not be promulgated or tolerated.

This zoning change will provide for industry that will negatively affect the health safety and welfare of our community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Michael Thompson

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Please vote no on rezoning. My spouse and I grew up in Jefferson county. We have been an active duty Air Force family for years now, and have a son. Whenever we travel back home (still considered our "home of residence") we are saddened to see the state of affairs. It's becoming no place to raise a family safely. I hope you will reconsider and vote NO.

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovas.

Sincerely,

Maya Williams

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask you to vote NO on Ordinance #2017-302. The industry this zoning change will allow for endangers the health, safety and, welfare of the community, and violates the premise of the smart code zoning that we have spent so much time, effort and federal money employing.

This zoning change will provide for industry that will negatively affect the agriculture industry in Jefferson County and beyond. The combination of the air emissions and threat to the ground water resources could have devastating consequences for the agricultural community of Jefferson County.

The comprehensive plan of Ranson is clear: it states, "the City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community." This land is ill-suited for an industrial facility due to its location and hydrogeology. Further, the industry that this zoning change will allow for will adversely affect the health, safety, and welfare of the community through its affect on the agricultural industry.

The agriculture industry in Jefferson County is hundreds of years old and continues to serve our community well today. According to the economic impact study "A Shared Agenda for Growing West Virginia's Agricultural Economy, Prepared by Fourth Economy for West Virginia Department Of Agriculture West Virginia University Extension Service 2012," Jefferson County is the second highest producing county for crops sales, third highest for fruits and vegetables sales, and in the top 9 counties for sales of animals and animal products.

Agriculture, tourism and the equine industries work synergistically to have an outsized positive impact on the economy in Ranson and Jefferson County as a whole. Agriculture drives tourism by creating agro-tourism opportunities, preserving beautiful open spaces that contribute to the

bucolic nature of our county, and providing the locally produced agriculture goods many tourists are look for in our markets and restaurants. Agriculture also supports the equine industry by providing local products like hay and straw, helping maintain pasture land, co-supporting local dual-purpose retail stores, and helping recycle by products. Agriculture helps maintain the way of life that many those who choose to live in Jefferson County enjoy. Industrial manufacturing and industry this zoning will provide for could never achieve these things.

Local agriculture also provides a source of locally produced agricultural goods. It has become apparent with the current pandemic and health emergency. This became a supply chain crisis because as our supply chains have moved to be ever more lean and efficient they lack resiliency and agility. By having a local source of agricultural goods and food we add resiliency and agility into our own economy and community. The agricultural industry in Jefferson County provides this.

A plethora of scientific studies have shown that a variety of air pollutants produced by the type of industry this zoning change would provide for causes decreased yields of both quantity and quality for several of the crops important to Jefferson County including winter wheat and soybeans. Soybeans and wheat are two of the crops significantly affected and two of the most prevalent crops in Jefferson County. Lower crop yields harm the farms and all the members of the down stream supply chain as well as the consumer. In this way, this zoning change will adversely affect the welfare of the community.

Recent studies have shown that even small increases in air pollution affect the productivity of agricultural workers. Similar to the reduction in crop yield this will negatively affect the individual workers, businesses, consumers and industry as a whole. In this way, this zoning change will adversely affect the health and welfare of individuals and the community.

Even more devastating is the possibility of groundwater contamination. The land at the subject location has karst hydrogeology and as such has porous bedrock and severe ground instability problems. The porous bedrock allows rapid diffuse infiltration of surface water into ground water and the severe ground instability problems leads to sinkhole development. Sinkholes provide direct connection of the surface water with the ground water aquifer through point infiltration. In fact, according to a 2012 study by Doctor and Doctor, the subject location and that of Terrapins Neck have the highest sinkhole vulnerability of any sites in Jefferson County. The propensity and easy of diffuse and point infiltration in areas of karst hydrogeology give them very high aquifer vulnerability meaning the aquifer is very vulnerable to contamination. For this reason, this measure has been used for decades by policymakers to set land use regulations. In this way, this zoning change and the industry it will provide for will adversely affect the welfare of the community.

The WVDEP recognizes development in car karst areas puts water resources high-risk for contamination but also recognizes that this is best protected against true local land use and zoning ordinances. WVDEP's guiding document Stormwater Management Design in Karst Areas

states, "it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." This document also references the Chesapeake Bay Stormwater Network karst stormwater guidance document the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed. In which it states "...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." Land use policy in Ranson and zoning need to take aquifer vulnerability into consideration as these agencies and documents suggest.

The Jefferson Orchards Voluntary Remediation Plan application reports that the ground water is only 60 feet from the surface at the site. It is described in the scientific literature that this land is an upland plane with large amounts of water in the epikarst, and contamination of this water effects the whole aquifer including the communications with surface water streams. A USGS study demonstrated that the groundwater adjacent to the site communicates readily with several surface water structures and wells miles away from the site. The effects of contamination at this site would go well beyond Ranson fouling large portions of the ground water and surface water in Jefferson County.

Groundwater contamination at the site would have devastating effects on the Agricultural industry in Jefferson county. For geographic and economic reasons it is simply infeasible for the agricultural industry to rely on utility provided water. Based on the scientific literature the site being considered for rezoning is one of the areas of highest aquifer vulnerability in Jefferson County and is inappropriate for the industry that this zoning change will provide for. This land is clearly ill-suited for industrial use and should not be zoned for it.

By threatening the local agricultural industry, the industry that this zoning will provide for will threaten the health, safety, and welfare of the community, and this land is not well-suited for industrial use. The Comprehensive Plan in Ranson is clear the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Claiborne Lashley

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask you to vote NO on Ordinance #2017-302. The industry this zoning change will allow for endangers the health, safety and, welfare of the community, and violates the premise of the smart code zoning that we have spent so much time, effort and federal money employing.

This zoning change will provide for industry that will negatively affect the agriculture industry in Jefferson County and beyond. The combination of the air emissions and threat to the ground water resources could have devastating consequences for the agricultural community of Jefferson County.

The comprehensive plan of Ranson is clear: it states, "the City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community." This land is ill-suited for an industrial facility due to its location and hydrogeology. Further, the industry that this zoning change will allow for will adversely affect the health, safety, and welfare of the community through its affect on the agricultural industry.

The agriculture industry in Jefferson County is hundreds of years old and continues to serve our community well today. According to the economic impact study "A Shared Agenda for Growing West Virginia's Agricultural Economy, Prepared by Fourth Economy for West Virginia Department Of Agriculture West Virginia University Extension Service 2012," Jefferson County is the second highest producing county for crops sales, third highest for fruits and vegetables sales, and in the top 9 counties for sales of animals and animal products.

Agriculture, tourism and the equine industries work synergistically to have an outsized positive impact on the economy in Ranson and Jefferson County as a whole. Agriculture drives tourism by creating agro-tourism opportunities, preserving beautiful open spaces that contribute to the

bucolic nature of our county, and providing the locally produced agriculture goods many tourists are look for in our markets and restaurants. Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would negatively affect tourism, economic agility, groundwater quality, and individual health in neighboring municipalities like Shepherdstown. In doing these things the industry that this zoning change provides for will adversely affect the health, safety, and welfare of our community.

Tourism is critically important to Shepherdstown's economy and to the county as a whole. In 2018, tourist spending in the Jefferson County contributed over \$170 million to state and local government revenue and \$213 million in individual earnings. Importantly, most of this money comes from tourists visiting from neighboring states like Virginia, Maryland, and Washington D.C. Out-of-state tourists are largely drawn to Jefferson County because of its reputation for environmental-friendly, sustainable industry. Key elements that support this reputation include the county's pastoral scenery and pristine natural resources. Ordinance #2017-302 will allow industry into Jefferson County that risks harming these elements and dramatically reducing the area's appeal to visitors. The resulting harm to our tourist industry would drive away visitors and decrease state, county, and local revenue. The long-term success of Jefferson County's tourism industry is dependent on local governments making coordinated zoning decisions. Allowing certain types in industry in Ranson will negatively affect tourism in every municipality throughout the county, including Shepherdstown. Voting no on ordinance #2017-302 will protect the foundations of the county's tourism industry and protect the 7,040 jobs in Jefferson County that are directly supported by tourism. In this way the industry this zoning change will allow will adversely affect the welfare of our community.

The type of large, consolidated industry that ordinance #2017-302 would allow in Ranson would generally reduce the flexibility of local economies in Jefferson County. Historically, the driving industries in Jefferson County have been tourism, agriculture, and the equine industries. These three industries are large conglomerates of small businesses. Small business is very important

to Shepherdstown. Small businesses have been shown to create more jobs, cultivate more innovation, and provide more opportunities than big, non-local firms. Additionally, small businesses have been shown to be more reactive to sudden changes relative to manufacturing businesses. Bringing large, manufacturing-based industry into Jefferson County will depress the local economy and stifle innovation. During this time of economic upheaval and uncertainty, Jefferson County needs to support industries that will allow local economies to adapt and recover as fast as possible.

Voting no on ordinance #2017-302 will help protect water resources throughout Jefferson County. The type of industry that ordinance #2017-302 would allow puts the ground resources of Jefferson County at significant risk due to the karst hydrogeology. The site in Ranson is in the Rocky Marsh Run watershed, which is in the source water protection zone for Shepherdstown and drains to the Potomac River. Therefore, activity at this site will affect both groundwater and surface water streams. In municipalities like Shepherdstown, many residents and nearby farms depend on wells for water. Contamination of groundwater aquifers would create both health and remediation concerns for local residents. Dye tests performed by the USGS near the area of proposed rezoning in Ranson have shown just how far-reaching groundwater contamination at the Ranson site could be. Results from the USGS study revealed measurable dye concentrations in Elk's Run, Rattlesnake Run, and even the Shepherdstown Town Run. This last run cuts through the center of Shepherdstown and is a favorite area for children to play and learn to fish. In this way, the industry that this zoning change will allow will adversely affect the safety of our community.

Groundwater pollution is not the only concern for communities like Shepherdstown. The type of industry that ordinance #2017-302 would allow in Ranson would also generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. These pollutants are particularly harmful to children. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. The site in Ranson is across the road from an elementary school and also within the Jefferson High Middle district. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of children in Shepherdstown and all of Jefferson County. In this way, the industry that this zoning change will provide for will adversely affect the health of our community.

In an era when environmental protections are being rolled back at an alarming pace, it becomes even more critical for local governments to take a stand in protecting people and the environment. It is our responsibility to take action now to ensure a future for our children, and ourselves.

I again request that you vote no on ordinance #2017-302. This zoning change will allow industry that will adversely affect the health, safety, and welfare of our community. The long-term economic, environmental, and community health of municipalities like Shepherdstown depend on Ranson's participation in a coordinated zoning plan for all of Jefferson County.

Sincerely,

Rebecca Walker-Keegan

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on #2017-302. The air emissions, possibility of ground and surface water contamination, and their effect on our interwoven economies threaten the health, safety and welfare of not just Jefferson County but the greater region, including Loudoun and the greater Northern Virginia area.

This zoning would provide for industry that produces large amounts of air emissions. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. Northern Virginia is directly downwind from these emissions. Much of the gaseous, fine particulate, and hazardous emissions can reach Northern Virginia. Further affecting the outdoor air quality of the adjacent portion of Virginia and the ability of these areas to achieve and maintain National Ambient Air Quality Standards (NAAQS) attainment. This will affect agriculture and outdoor leisure and recreation.

For example, Loudoun County has been in nonattainment for the NAAQS 8-hour Ozone standard for the past two years. VOC and NO_x react after they have been emitted to produce ground level ozone. The industry that this rezoning would provide for would produce large amounts of these emissions. This would make it even harder as Loudoun County tries to achieve attainment. As time goes on and the scientific research advances our knowledge and understanding of the extent to which gaseous, particulate and hazardous emissions affect human health the NAAQS standards are likely to be reduced. The effects on air emission from this rezoning will make it only harder for Loudoun and Northern Virginia to meet these standards.

In addition to the concerns about the air, the possible ground and surface water contamination is very concerning to Loudoun and Virginia residents. The site is known to have ground water that is vulnerable to contamination due to the karst hydrogeology. A USGS study demonstrated that the ground water adjacent to the site to be rezoned communicates readily with surface

water tributaries of the Potomac River. In addition to direct infiltration where water moves directly from the surface to groundwater via porous limestone bedrock, karst is known to have severe ground instability problems. This makes karst geology prone to sinkhole development. Sinkholes provide direct connection between the surface water and any contaminants it may contain and the groundwater. This makes the aquifer vulnerability in karst areas very high, and contamination with industrial activity such as that provided for by this rezoning too likely. In this way, this zoning change will adversely affect the health and welfare of individuals and the community.

Loudoun sources its drinking water from the Potomac River, downstream of many West Virginia tributaries that carry water from the epikarst and groundwater aquifer at the site to be rezoned. Loudoun has recently completed the new Trap Rock Water Treatment facility, which draws water from the Potomac River. Loudoun currently provides 40 million gallons and projects to provide 90 million gallons of drinking water a day to customers by 2040 (Loudounwater.org). Therefore, the viability of the Potomac River is a high priority for Virginia residents.

Loudoun and Northern Virginia is one of the fastest growing communities in the country and provides a lot to Jefferson County in their symbiotic relationship. Virginia residents support and enjoy Jefferson County through tourism, as our residents enjoy the natural and historical resources of your county. Virginia residents and businesses support the equine industry in a multitude of ways from providing wagering fans at the races to the Virginia Breeders Association Virginia Certified incentive programs and a strong market for retired racehorses. According to an economic impact study from WVU, at least 40% of Jefferson County residents travel outside of West Virginia for work, a good percentage of those travel to northern Virginia. This rezoning would allow for industry that would negatively affect the economy of both places and this relationship and the benefits for our residents gleaned from it.

This zoning change will provide for industry that will negatively effect the health safety and welfare of the Loudon and Northern Virginia community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

MLS

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Daniel Blackmore

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that will significantly harm the municipalities within Jefferson County and beyond effecting the health, welfare, and safety of our community. Harpers Ferry is a national treasure with the natural and historic resources tours flock to see each year and one of the communities that will be negatively impacted by this zoning change.

According to a 2019 study by the West Virginia Tourism Office, Jefferson County generated an average of \$178 million per year in tourism-derived revenue for state and local governments over the last 10 years, more than any other county in West Virginia by at least double. Tourism benefits the businesses and economy of Ranson and Jefferson County producing \$213.7 million in individual earning, 7040 jobs, and \$842.6 million in direct spending here in 2018. We would need 40 Project Shuttles to replace the individual earnings and 59 Rockwools to replace the jobs provided by the tourism industry in Jefferson County. It is important to note that most of the money generated by tourism in Jefferson County comes from neighboring states. In this way, it is like an export: not simply recycling money, but bringing money into the state increasing its wealth. Much of the economy in Harpers Ferry is based on this tourism industry. A threat to this industry poses a threat to the economy and welfare of our community.

One of the important drivers for tourism in Harpers Ferry is the Appalachian Trail. According to the Appalachian Trail Conservancy (ATC), Harpers Ferry is the psychologic midpoint of the Trail, and hikers often plan extended stays in Jefferson County with an obvious positive impact. The ATC reports that the smokestacks and associated lights will be visible in the viewshed of 15 vistas on the Appalachian Trail (AT). Studies have shown that quality of vistas and human impact on the environment are not only noticed by visitors, but effect their experience. Another study published in the Journal of Applied Recreation Research, found that points of interests and views drew visitors' attention and had a significant impact on their perception of the trail. It was also found that particularly beautiful vistas helped visitors overlook elements

that usually have a negative effect on trail experience like increased trail traffic. A 2009 study in Leisure Sciences revealed that scenic value was a perceptual theme of Appalachian Trail visitors, and that things as simple as dead trees visible in a vista can have a negative impact on visitors' overall perception. Imagine the effect the smokestacks will have from the 15 vistas from which they will be visible. The introduction of industrial activity made possible by the proposed rezoning in Ranson would have a negative effect on the scenic views of beautiful landscapes from the Appalachian Trail in Jefferson County.

The smokestacks are not all visitors will be able to see — the air pollution will create haze. The effect of regional haze on tourists was explored in a review article published in the Atmospheric Environment titled "Impaired visibility: the air pollution people see." A key takeaway on the negative affect of haze on vacationing tourists was summarized as follows:

"Vacations offer an escape from the routine and stress of our daily lives. Vacation destinations are often chosen based on their scenery; vacations are spent gazing at monuments, mountains, clouds, and oceans. Good visibility allows clear observation of distant features and appreciation of the inherent beauty of these scenes...Air pollution, which is often present in both our cities and parks, interferes with these attributes and can ruin the views vacationers travel to enjoy."

People seek bucolic, unspoiled areas to escape the stresses of urban areas. A 2004 study in Environment and Behavior found perceived pollution causes stress while viewing natural scenes has both psychological and physiological benefits, and a 2007 study confirmed these benefits. Two other studies found that people are emotionally affected by poor visibility, and tourists are disappointed when views are obscured by haze.

The combination of smokestacks and haze will mar the viewshed and will not only reduce the positive effects of a scenic landscape but also leave tourists disappointed and dissatisfied with their choice of destination. With these effects the welfare of the Harpers Ferry community would undoubtedly be endangered by the industry that this zoning change will provide for.

Multiple studies by doctors Kozar, Doctor, and Doctor have demonstrated that the land at this site to be rezoned is Karst with the highest likelihood of sinkhole development in the county, and that the groundwater aquifer there is incredibly sensitive to contamination from surface water. Further, this site is on an upland plain with relatively few surface streams, seasonal variability in the water table that results in numerous estavelles, and large amounts of water in the epikarst. In this area contamination in surface water communicates easily to the water in the epikarst via diffuse and point infiltration, and the springs at the margins of the upland area are directly affected by the water quality throughout the aquifer. According to Jefferson Orchards Voluntary Remediation Plan with the WVDEP, the groundwater at the site is approximately 60 feet below the ground, and the tests performed by the USGS have shown that groundwater from just adjacent to this site emerged in the headwaters of both the Elk's Run and Rattlesnake Run. This is critically important for Harpers Ferry because the Elk's Run headwaters is a spring about three miles southeast of the site and goes on to become the drinking water source for Harpers Ferry and Bolivar before emptying into the Potomac River.

The headwaters of Rattlesnake Run is a spring about 3.5 miles from the site and is also a tributary of the Potomac River. The Potomac River is the back up water source for Harpers Ferry. This means that the activity at the site will have a critical influence on the drinking water of Harpers Ferry. In this was the industry permitted by this change in zoning would undoubtedly endanger the health and safety of the community in Harpers Ferry.

The untoward health effects and individual economic consequences from the pollution emissions of the industry this rezoning will allow that will be born out over the length of people's lives and that of their decedents for at least three generations is an egregious example of environmental injustice that should not be tolerated. This zoning change may be in one of the poorest sections of the county, but the effects will be felt in every part of Ranson and the county.

The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." The industry that this rezoning will allow will jeopardize the health, safety and welfare of Ranson, Harpers Ferry and the whole county. Please vote no on the ordinance #2017-302.

Sincerely,

Brandon Mule

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

In addition to Ranson not following its comprehensive plan, Ranson's removal of the height restriction not only sets Ranson up for failure (bad air quality), but also sets the valley up for failure. The smokestacks Rockwool will be using (the 213 feet tall smokestacks) are not tall enough to get the emissions over the mountains, so even on windy days, the vast majority of the pollution is going to be trapped. All of the awful emissions are going to be trapped on stagnant weather days. They are awful expected emissions. Using the Byhalia factory emissions (a similar factory), which wasn't even running at full capacity til the end of 2018, Rockwool Ranson, at a minimum, will be releasing more EPA registered toxic chemicals into the valley's air than ALL existing industry in Jefferson and Berkeley County combined. And that is just the toxic chemicals like formaldehyde. It is not inclusive of the awful increases in hazardous air pollutants like PM2.5. I haven't been able to get those figures to calculate them.

Rockwool uses even taller smokestacks at its fossil fuel burning factory in France and the area around that factory still has emission buildup issues. The area would have it even worse if the smokestacks were shorter. Not that I'd want Rockwool Ranson's stacks to be constructed taller because they'd become an even bigger eyesore and also make the pollution a problem for the valley and for the four state region. The stacks themselves are the problem! Ranson shouldn't be permitting them. Rockwool could be using its minimum 7x cleaner electric arc furnace. Rockwool could also easily run that arc furnace during non peak energy demand times, which is most of the day and all night, so no additional electric generation is needed. It is unacceptable that Ranson changed its code to allow the smokestacks which ultimately is enabling the instalation of Rockwool's giant coal fired melt furnace. A very backwards and unhealthy development! Please stop this nonsense!

I respectfully ask you to vote NO on Ordinance #2017-302. The industry this zoning change will allow for endangers the health, safety and, welfare of the community, and violates the premise

of the smart code zoning that we have spent so much time, effort and federal money employing.

Any change in zoning needs to align with the comprehensive plan. In Ranson's current comprehensive plan (2012), the city only refers to "heavy industry" in the history section. Here it is characterized as part of a bygone era that has been replaced by an emphasis on agriculture for local food production, open spaces, and quality-of-life. In the remainder of the document, the word industry is used loosely to describe businesses including flower shops and shoe stores. Nothing that resembles the industry that this zoning change will provide for is described in the current comprehensive plan of Ranson.

In the land use section of the comprehensive plan, number ten states:

"Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The comprehensive plan clearly states that the city will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community. This change in zoning clearly negatively affects the health, safety, and welfare of the community.

As the zoning is proposed, the industry that this zoning change will allow for will be directly across the street from houses, parks and other small businesses. A densely populated subdivision and an elementary school already exist directly across the street. While these latter community sections are not in the city limits, the effect of this zoning on them should still be considered just the same as it would be if they were in the city limits.

The industry that this zoning change will provide for will produce particulate, gaseous, and hazardous air emissions. These emissions have been shown to be detrimental to human health at every stage of life from embryo to old age. In utero and childhood exposure are the most damaging with lasting effects being realized through out life, and with maternal exposure the effects can be felt for generations. Multiple organ systems are affected including respiratory, cardiovascular, neurologic, immune, and endocrine causing defects in multiple processes including in utero development, neurodevelopment, immune and tolerance development, and cognitive defects. There are also psychological, social, and economic effects from both perceived and actual air pollution in both children and adults. Many of these effects can be seen even with short-term exposure or exposure that is lower than the levels recommended by the US Environmental Protection Agency and World Health Organization. These consequences are devastating to the individual and depressing to the local community and economy. State law does not allow a school to be built next to industry that this zoning will allow but yet we are contemplating changing the zoning so this industry can build next to a school. This does not make sense. As Ranson residents, we want Ranson to follow the lead of the state and keep polluting industry away from kids. In these ways, this change in zoning will negatively affect the health and welfare of the community.

In addition to the health effects of the air emissions is the threat to groundwater from the industry that this zoning change would allow. The land in question has karst hydrogeology and therefore very high aquifer vulnerability and is not appropriate for this industry. With the type of industry this zoning will provide for, combined with high aquifer vulnerability, the likelihood of groundwater contamination is too high for the community and region to bear. A USGS study demonstrated that contamination in the groundwater adjacent to the site moves relatively quickly and can be found in wells and surface water structures in a variety of locations in the County. In this way, contamination at the site would affect the drinking water of the great majority of Jefferson County residents. Through the surface water connections, the water at the site also affects the water resources of the region.

Aquifer vulnerability has been used by policy makers for decades to set land use regulations. The guiding document, from the WVDEP, Stormwater Management Design in Karst Areas states, "it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." In Ranson, we need to follow this advice and not change the zoning of this land for use by industry that has among the highest aquifer vulnerability in the County. This zoning change will endanger the safety of the community and region by endangering the safe water resources. As Ranson residents, we want to safeguard the water resources of the county and region by following the WVDEP guidance here.

Further, by reallocating this transect district and replacing it with a monolithic block of Special District Industrial designation, hundreds of housing units, parks and space for small businesses are lost. Ranson loses the potential for property tax on these properties and their improvements, Business and Occupational tax on the businesses and sales tax in retail stores. The community loses out on the opportunity to develop affordable housing and create locations where people can live, work, play, and shop all in the same place reducing the need for travel.

Worse yet apparently a deal has been made where the entity that owns the subject land has required that a litany of things not be built on the adjacent land essentially stripping the purpose of the smart code transect zone that exists there. Transect zones in the smart code are meant to transition, from out to in, and provide communities where people can safely work and live in close proximity in an effort to reduce travel. Excluding many of the components of the transect zone effectively eliminates the features that make it a transect zone, thus, losing the benefits a transect zone offers the community and city. By losing these benefits, reducing the overall and affordable housing prospects, and reducing so drastically the opportunities for city income, this zoning change will negatively affect the welfare of the community.

As Ranson residents, we find it odd that we are changing zoning to provide for industry that we would not put in the middle of our town close to our residents, but we are placing it close to

the homes of county residents. Further, it is striking that the area where this change in zoning is directly adjacent to historically underserved lower income communities and a Title I school. This amounts to environmental injustice and cannot be tolerated.

The purpose of zoning is for a city to protect the health, welfare, morals and safety of the community. In this case, the air emissions and heavy truck traffic will endanger the communities' health. The threat of water contamination will endanger the safety of the community. The effect of lost productivity and decreased workforce participation due to increased illness and the negative effect the air emissions and presence of such a factory will have on the local economy will negatively affect the welfare of the community. The environmental injustice of changing the zoning to accommodate such polluting industry in a location where your municipality has no residents, but yet hundreds of low income and underserved county residents live is egregiously amoral. This must not happen. We respectfully implore you to do the right thing and vote no on ordinance #2017-302.

Sincerely,

Jeffrey Gustafson

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would negatively affect tourism, economic agility, groundwater quality, and individual health in neighboring municipalities like Shepherdstown. In doing these things the industry that this zoning change provides for will adversely affect the health, safety, and welfare of our community.

Tourism is critically important to Shepherdstown's economy and to the county as a whole. In 2018, tourist spending in the Jefferson County contributed over \$170 million to state and local government revenue and \$213 million in individual earnings. Importantly, most of this money comes from tourists visiting from neighboring states like Virginia, Maryland, and Washington D.C. Out-of-state tourists are largely drawn to Jefferson County because of its reputation for environmental-friendly, sustainable industry. Key elements that support this reputation include the county's pastoral scenery and pristine natural resources. Ordinance #2017-302 will allow industry into Jefferson County that risks harming these elements and dramatically reducing the area's appeal to visitors. The resulting harm to our tourist industry would drive away visitors and decrease state, county, and local revenue. The long-term success of Jefferson County's tourism industry is dependent on local governments making coordinated zoning decisions. Allowing certain types in industry in Ranson will negatively affect tourism in every municipality throughout the county, including Shepherdstown. Voting no on ordinance #2017-302 will protect the foundations of the county's tourism industry and protect the 7,040 jobs in Jefferson County that are directly supported by tourism. In this way, the industry this zoning change will allow will adversely affect the welfare of our community.

The type of large, consolidated industry that ordinance #2017-302 would allow in Ranson would generally reduce the flexibility of local economies in Jefferson County. Historically, the driving industries in Jefferson County have been tourism, agriculture, and the equine industries. These three industries are large conglomerates of small businesses. Small business is very important

to Shepherdstown. Small businesses have been shown to create more jobs, cultivate more innovation, and provide more opportunities than big, non-local firms. Additionally, small businesses have been shown to be more reactive to sudden changes relative to manufacturing businesses. Bringing large, manufacturing-based industry into Jefferson county will depress the local economy and stifle innovation. During this time of economic upheaval and uncertainty, Jefferson County needs to support industries that will allow local economies to adapt and recover as fast as possible.

Voting no on ordinance #2017-302 will help protect water resources throughout Jefferson County. The type of industry that ordinance #2017-302 would allow puts the ground resources of Jefferson county at significant risk due to the karst hydrogeology. The site in Ranson is in the Rocky Marsh Run watershed, which is in the source water protection zone for Shepherdstown and drains to the Potomac River. Therefore, activity at this site will affect both groundwater and surface water streams. In municipalities like Shepherdstown, many residents and nearby farms depend on wells for water. Contamination of groundwater aquifers would create both health and remediation concerns for local residents. Dye tests performed by the USGS near the area of proposed rezoning in Ranson have shown just how far-reaching groundwater contamination at the Ranson site could be. Results from the USGS study revealed measurable dye concentrations in Elk's Run, Rattlesnake Run, and even the Shepherdstown Town Run. This last run cuts through the center of Shepherdstown and is a favorite area for children to play and learn to fish. In this way, the industry that this zoning change will allow will adversely affect the safety of our community.

Groundwater pollution is not the only concern for communities like Shepherdstown. The type of industry that ordinance #2017-302 would allow in Ranson would also generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. These pollutants are particularly harmful to children. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. The site in Ranson is across the road from an elementary school and also within the Jefferson High Middle district. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of children in Shepherdstown and all of Jefferson County. In this way, the industry that this zoning change will provide for will adversely affect the health of our community.

I again request that you vote no on ordinance #2017-302. This zoning change will allow industry that will adversely affect the health, safety, and welfare of our community. The long-term economic, environmental, and community health of municipalities like Shepherdstown depend on Ranson's participation in a coordinated zoning plan for all of Jefferson County.

Sincerely,

Darlene Donaldson

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask that you vote no on Ordinance #2017-302. While not in Ranson, the land and homes around the property that is the subject of the zoning change are closer to the property than anyone who currently lives within the city limits of Ranson. This area will be affected sooner and more harshly by the environmental issues that will develop secondary to the inappropriate siting of industry this zoning would allow.

The subject land has been well studied by Drs. Kozar, Doctor and Doctor and described in the scientific literature and USGS reports as having karst hydrology with very high aquifer vulnerability. The karst landscape is a consequence of the presence of soluble bedrock, which consists of limestone in the case of the subject land. In such landscapes water percolates through the ground and dissolves the underlying rock creating a porous network of caverns and throughways. Karst aquifers are known to be "extremely vulnerable to pollution" due to direct connection between the surface water and groundwater through both point (sinkholes) and diffuse (everywhere) infiltration. It is known from the Voluntary Remediation Plan of Jefferson Orchard that the groundwater at the subject site is only 60 feet below the ground. The subject property and much of the property around it are on an upland plain with few surface streams, but great seasonal variability in the water table resulting in numerous esteves and large amounts of water in the epikarst. This water is easily contaminated and this contamination spreads quickly throughout the aquifer. Dye tests performed near the subject site by the USGS have demonstrated this quick moving thorough dispersment in the aquifer in this area. While this contamination goes on to affect springs at the margins of the upland area continuing on in streams that service municipal water sources and the Potomac River, our concerns are far more immediate in both time and distance. Well water is the only water source available in the area of the proposed zoning change and, with the exception of Fox Glen, a majority of this water is supplied by private wells. Therefore, the groundwater aquifer fulfills a critical necessity, fulfilling all needs including human consumption, household uses, and agriculture and

maintenance of livestock and horses in the immediate area around the site. The concern is that if the aquifer becomes contaminated, then the local drinking water will be fouled.

For decades now, policy makers have been using “Aquifer Vulnerability,” to set land use and water resource protection policy. Karst has very high Aquifer Vulnerability. Therefore, this industrial use is not appropriate for this land and it should not be zoned for it. The guiding documents of the WVDEP recognize this. The introduction to the WVDEP document Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.”

The Chesapeake Bay Stormwater Network karst stormwater guidance document the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed, which the WVDEP cites in its own guiding document Stormwater Management Design in Karst Areas, clearly agrees stating:

“First, the effect of land development on karst terrain is complex and hard to predict, and requires professional analysis to reduce the risk of geological hazards, damage to infrastructure and groundwater contamination.” “The working group acknowledges that past approaches to stormwater and land development in karst terrain have been inadequate to safeguard the public and the environment.” “...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” We clearly need stronger comprehensive land use plans and zoning that direct new growth away from karst areas to more appropriate locations. Ordinance #2017-302 is literally the opposite of this.

Further, we cannot rely on the WVDEP to do the job that good local land use guidelines and zoning should do. For example, the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed states that detention and retention ponds are not recommended on karst and categorize them as discouraged. Also, quoting WVDEP’s own karst guidance: “attenuating surface runoff will increase the rate of sinkhole formation and potential groundwater contamination.” Yet the entity currently planning to utilize this zoning change is planning employment of multiple massive retention ponds and attenuating surface runoff completely. This has already been approved by the DEP in two Construction Stormwater General Permit registrations for that company. One of detention ponds is not even regulated by the DEP as it contains process water and has no outlet. Clearly the DEP recognizes the risks but is not appropriately limiting them. Relying on the DEP to protect the public health, safety, welfare, and the environment from any entity in these karst locations is simply as the CNS bulletin said it “inadequate to safeguard the public and the environment.” We must have appropriate zoning that takes into consideration appropriate use of land with karst hydrogeology. Ordinance #2017-302 does not do this, but instead increases the risk to the public and the environment.

A second serious concern is the air emissions from the industry that this zoning will provide for. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. These types of air emissions have been shown to increase the risk of, contribute to, and exacerbate a multitude of developmental, physical, physiological, physiological, cognitive and economic. The exposure of one individual can cause repercussions in multiple generations. Embryos, fetuses, and children are most vulnerable with effects born out over a lifetime, and that of their offspring. Many of these effects only require short-term exposure and some have even been shown to occur at levels below current limits recommended by the World Health Organization. One example of this is that a recent study found that “Even within the limits set by the World Health Organization, the pollutants PM₁₀, SO₂, NO₂, and O₃ are associated with increased risk of treatment for respiratory diseases in children 0 to 6 years of age.” Unfortunately, the US limits are higher than WHO, 300 % higher in the case of PM₁₀!

In fact, in 2019, in the Advice from the Independent Particulate Matter Review Panel (formerly U.S. EPA Clean Air Scientific Advisory Committee Particulate Matter Review Panel) on EPA’s Policy Assessment for the Review of the National Ambient Air Quality Standards for Particulate Matter, it stated that the committee unanimously and unequivocally found that the current primary annual and 24-hour PM_{2.5} National Ambient Air Quality Standards (NAAQS) are not adequate to protect public health. The advice from this 20-member committee, whose scientific disciplines include epidemiology, medicine, toxicology, air quality measurement, air quality modeling, exposure assessment measurement and modeling, risk assessment, statistics, and others, was ignored due presumably to political pressure. Not only are the NAAQS too high in some cases, but due to the measure and mechanism by which they work, they can not replace the safety provided by good land use and zoning regulations, that are meant to do things like keep factories with air emissions and hundreds of heavy trucks away from elementary schools. In fact, there is a state law that prohibits siting a school near a factory. Unfortunately, the reciprocal law does not exist. Clearly, just like with the water resources, we cannot rely on the DEP or the EPA to do the job of what appropriate zoning should do. The whole point of zoning is to keep people safe and provide for their health and welfare. Ordinance #2017-302 puts families and school children directly in harms way.

The air emissions, threat to the groundwater, and the very presence of the industry that this zoning change will allow for will have a serious negative economic effect on those who live and or work closest to the site in question. Productivity and workforce participation will be negatively affected by the health effects of the air emissions. The local agricultural operations will be negatively affected by the air emissions with lower quantity and quality of crop yield and would be devastated if the ground water aquifer were fouled. The equine operations in the area, of which there are several, will be negatively affected by the air emissions as they affect the horses’ health and performance. The mere presence of the industry that will be provided for by this zoning change will cause property values to fall. There will be serious economic consequences for the immediate area around the site in question.

Several of the communities in the immediate area of the site for proposed zoning change are traditionally underserved and have lower economic status. The choice of this location for such a zoning change represents an egregious example of environmental injustice that should not be promulgated or tolerated.

This zoning change will provide for industry that will negatively affect the health safety and welfare of our community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Joy Bridy
Shenandoah Junction, 25442

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask that you vote no on Ordinance #2017-302. While not in Ranson, the land and homes around the property that is the subject of the zoning change are closer to the property than anyone who currently lives within the city limits of Ranson. This area will be affected sooner and more harshly by the environmental issues that will develop secondary to the inappropriate siting of industry this zoning would allow.

The subject land has been well studied by Drs. Kozar, Doctor and Doctor and described in the scientific literature and USGS reports as having karst hydrology with very high aquifer vulnerability. The karst landscape is a consequence of the presence of soluble bedrock, which consists of limestone in the case of the subject land. In such landscapes water percolates through the ground and dissolves the underlying rock creating a porous network of caverns and throughways. Karst aquifers are known to be "extremely vulnerable to pollution" due to direct connection between the surface water and groundwater through both point (sinkholes) and diffuse (everywhere) infiltration. It is known from the Voluntary Remediation Plan of Jefferson Orchard that the groundwater at the subject site is only 60 feet below the ground. The subject property and much of the property around it are on an upland plain with few surface streams, but great seasonal variability in the water table resulting in numerous esteves and large amounts of water in the epikarst. This water is easily contaminated and this contamination spreads quickly throughout the aquifer. Dye tests performed near the subject site by the USGS have demonstrated this quick moving thorough dispersment in the aquifer in this area. While this contamination goes on to affect springs at the margins of the upland area continuing on in streams that service municipal water sources and the Potomac River, our concerns are far more immediate in both time and distance. Well water is the only water source available in the area of the proposed zoning change and, with the exception of Fox Glen, a majority of this water is supplied by private wells. Therefore, the groundwater aquifer fulfills a critical necessity, fulfilling all needs including human consumption, household uses, and agriculture and

maintenance of livestock and horses in the immediate area around the site. The concern is that if the aquifer becomes contaminated, then the local drinking water will be fouled.

For decades now, policy makers have been using “Aquifer Vulnerability,” to set land use and water resource protection policy. Karst has very high Aquifer Vulnerability. Therefore, this industrial use is not appropriate for this land and it should not be zoned for it. The guiding documents of the WVDEP recognize this. The introduction to the WVDEP document Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.”

The Chesapeake Bay Stormwater Network karst stormwater guidance document the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed, which the WVDEP cites in its own guiding document Stormwater Management Design in Karst Areas, clearly agrees stating:

“First, the effect of land development on karst terrain is complex and hard to predict, and requires professional analysis to reduce the risk of geological hazards, damage to infrastructure and groundwater contamination.” “The working group acknowledges that past approaches to stormwater and land development in karst terrain have been inadequate to safeguard the public and the environment.” “...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” We clearly need stronger comprehensive land use plans and zoning that direct new growth away from karst areas to more appropriate locations. Ordinance #2017-302 is literally the opposite of this.

Further, we cannot rely on the WVDEP to do the job that good local land use guidelines and zoning should do. For example, the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed states that detention and retention ponds are not recommended on karst and categorize them as discouraged. Also, quoting WVDEP’s own karst guidance: “attenuating surface runoff will increase the rate of sinkhole formation and potential groundwater contamination.” Yet the entity currently planning to utilize this zoning change is planning employment of multiple massive retention ponds and attenuating surface runoff completely. This has already been approved by the DEP in two Construction Stormwater General Permit registrations for that company. One of detention ponds is not even regulated by the DEP as it contains process water and has no outlet. Clearly the DEP recognizes the risks but is not appropriately limiting them. Relying on the DEP to protect the public health, safety, welfare, and the environment from any entity in these karst locations is simply as the CNS bulletin said it “inadequate to safeguard the public and the environment.” We must have appropriate zoning that takes into consideration appropriate use of land with karst hydrogeology. Ordinance #2017-302 does not do this, but instead increases the risk to the public and the environment.

A second serious concern is the air emissions from the industry that this zoning will provide for. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. These types of air emissions have been shown to increase the risk of, contribute to, and exacerbate a multitude of developmental, physical, physiological, physiological, cognitive and economic. The exposure of one individual can cause repercussions in multiple generations. Embryos, fetuses, and children are most vulnerable with effects born out over a lifetime, and that of their offspring. Many of these effects only require short-term exposure and some have even been shown to occur at levels below current limits recommended by the World Health Organization. One example of this is that a recent study found that “Even within the limits set by the World Health Organization, the pollutants PM₁₀, SO₂, NO₂, and O₃ are associated with increased risk of treatment for respiratory diseases in children 0 to 6 years of age.” Unfortunately, the US limits are higher than WHO, 300 % higher in the case of PM₁₀!

In fact, in 2019, in the Advice from the Independent Particulate Matter Review Panel (formerly U.S. EPA Clean Air Scientific Advisory Committee Particulate Matter Review Panel) on EPA’s Policy Assessment for the Review of the National Ambient Air Quality Standards for Particulate Matter, it stated that the committee unanimously and unequivocally found that the current primary annual and 24-hour PM_{2.5} National Ambient Air Quality Standards (NAAQS) are not adequate to protect public health. The advice from this 20-member committee, whose scientific disciplines include epidemiology, medicine, toxicology, air quality measurement, air quality modeling, exposure assessment measurement and modeling, risk assessment, statistics, and others, was ignored due presumably to political pressure. Not only are the NAAQS too high in some cases, but due to the measure and mechanism by which they work, they can not replace the safety provided by good land use and zoning regulations, that are meant to do things like keep factories with air emissions and hundreds of heavy trucks away from elementary schools. In fact, there is a state law that prohibits siting a school near a factory. Unfortunately, the reciprocal law does not exist. Clearly, just like with the water resources, we cannot rely on the DEP or the EPA to do the job of what appropriate zoning should do. The whole point of zoning is to keep people safe and provide for their health and welfare. Ordinance #2017-302 puts families and school children directly in harms way.

The air emissions, threat to the groundwater, and the very presence of the industry that this zoning change will allow for will have a serious negative economic effect on those who live and or work closest to the site in question. Productivity and workforce participation will be negatively affected by the health effects of the air emissions. The local agricultural operations will be negatively affected by the air emissions with lower quantity and quality of crop yield and would be devastated if the ground water aquifer were fouled. The equine operations in the area, of which there are several, will be negatively affected by the air emissions as they affect the horses’ health and performance. The mere presence of the industry that will be provided for by this zoning change will cause property values to fall. There will be serious economic consequences for the immediate area around the site in question.

Several of the communities in the immediate area of the site for proposed zoning change are traditionally underserved and have lower economic status. The choice of this location for such a zoning change represents an egregious example of environmental injustice that should not be promulgated or tolerated.

This zoning change will provide for industry that will negatively affect the health safety and welfare of our community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Valerie McLane

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote NO on Ordinance #2017-302. This rezoning will put an undue hardship on the wastewater treatment systems, burden the rate payers and risk surface waterways in Charles Town, risking the health, safety and welfare of the community. The comprehensive plan of Ranson states, the City "will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community." Therefore, please vote NO on #2017-302.

The nature of the industry that this zoning will allow will be harmful to our local economy. Charles Town has spent a lot of time and money improving our downtown area for restaurants and retail. We are working to take advantage of the tourism industry in our county and bring more people into Charles Town. The eye sore, noise pollution, air pollution, and obvious move away from sustainability will drive people away from Jefferson County and Charles Town, rendering our efforts ineffective and unrewarding. This will make it harder for our small businesses to be successful. In this way, the industry this zoning will provide for will adversely affect the welfare of our community.

According to the 2018 WVU economic study of the eastern panhandle, over 40% of the workforce in Jefferson County choose to work outside of the state. These commuters bring that money home and spend it here supporting our local small businesses, economy and government. Charles Town has a large number of residents who commute. These typically higher earners may choose to leave the area because of the presence of the industry that this zoning change would provide for. This will cause a hardship on our economy and municipality. In this way, the industry this zoning will provide for will adversely affect the welfare of our community.

The industry that this zoning will allow will cause stress for multiple reasons on the Charles Town wastewater treatment systems and the surface waterways in Jefferson County and

beyond. The industry currently planning to utilize the zoning change will have discharge to the wastewater system that is high in chloride, primarily from its water softening system. The NPDES permit modification allows up to 5,000 mg/L. Chloride is not settled or removed at the wastewater treatment plant. It cannot be removed by conventional means and would be prohibitively expensive to do by new technology. This is of concern to Charles Town because chloride can harm stream water and also impair functioning of the wastewater treatment plant. Furthermore, the corrosive nature of chloride can cause damage to pipes both in the wastewater system and those used by downstream drinking water systems, like the \$207 million Trap Rock Water Treatment plant in Loudoun.

The human health criteria for chloride under WV standards is 250 mg/L. Under low stream flow conditions, chloride additions to the treatment plant effluent, as proposed by the industry currently planning to utilize the zoning change, could cause chloride levels in Evitts Run to exceed this standard. If the amount of chloride increased due to expansion or higher throughput, then this human health standard would be violated frequently. Chlorides are also known to harm aquatic life and effect metal toxicity in rivers. The USEPA and several states have surface water guidelines of 230mg/L for chronic exposure. This would also pose a risk of damaging the water treatment facilities downstream on the Potomac River.

A research study by Lefebvre and Moletta in 2006 showed that chloride and salinity impair the ability of wastewater treatment to remove phosphorus and nitrogen, and because of this, other states have introduced legislation to treat saline wastewater. Uygur and Kargi in 2004 looked at the effects of salt on synthetic wastewater treatment. They found that removal of both nitrogen and phosphorus was reduced when salinity increased from 0 to 6%. In fact, the removal efficiency of ammonia dropped from 96% to 39% with this increasing salinity. Hong et al. In 2016 found phosphorous removal decreased 20-28% when chloride concentrations went from 150 mg/L to 1,500 mg/L. Phosphorous removal was completely inhibited at concentrations greater than 2,500 mg/L. This increased salinity has the potential to make the Charles Town wastewater treatment system work far less efficiently.

In addition to the contents of the wastewater this type of industry will produce, the volume of sewage is itself a concern. Given that the City of Charles Town has been in violation of its permit on numerous occasions for spills and overflow of untreated sewage, adding large volumes of wastewater will further challenge the near capacity system. This will mean that costly capacity upgrades will need to be done likely sooner than they would have needed to be done, imposing further financial strain on the system. Through these effects, the industry this zoning will provide for will adversely effect the health, safety, and welfare of the community.

This zoning change will provide for industry the likes of which are not present in this county and have not been present in this county for many decades. We find it appalling that the introduction of zoning for such industry is being done in an area of the county that is historically underserved and lower income. It is even more egregious because the worst effects including air pollution and groundwater contamination will be felt first and most severely in the immediate vicinity, and Ranson does not even have residents in the immediate vicinity of the

proposed zoning change. This decision is being contemplated without representation of those who will be most affected. This would be a deplorable example of environmental injustice.

This zoning will provide for industry that will harm our economy, drive away residents, challenge and or damage our infrastructure, and may damage our waterways and wild life. Through these effects, the industry this zoning would allow will adversely effect the health, safety, and welfare of our community. This is being done with out representation of those it will affect the most. Please vote No on Ordinance #2017-302.

Sincerely,

Kathleen Broadhurst

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Stephen Berzinskas

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would negatively affect tourism, economic agility, groundwater quality, and individual health in neighboring municipalities like Shepherdstown. In doing these things the industry that this zoning change provides for will adversely affect the health, safety, and welfare of our community.

Tourism is critically important to Shepherdstown's economy and to the county as a whole. In 2018, tourist spending in the Jefferson County contributed over \$170 million to state and local government revenue and \$213 million in individual earnings. Importantly, most of this money comes from tourists visiting from neighboring states like Virginia, Maryland, and Washington D.C. Out-of-state tourists are largely drawn to Jefferson County because of its reputation for environmental-friendly, sustainable industry. Key elements that support this reputation include the county's pastoral scenery and pristine natural resources. Ordinance #2017-302 will allow industry into Jefferson County that risks harming these elements and dramatically reducing the area's appeal to visitors. The resulting harm to our tourist industry would drive away visitors and decrease state, county, and local revenue. The long-term success of Jefferson County's tourism industry is dependent on local governments making coordinated zoning decisions. Allowing certain types in industry in Ranson will negatively affect tourism in every municipality throughout the county, including Shepherdstown. Voting no on ordinance #2017-302 will protect the foundations of the county's tourism industry and protect the 7,040 jobs in Jefferson County that are directly supported by tourism. In this way, the industry this zoning change will allow will adversely affect the welfare of our community.

The type of large, consolidated industry that ordinance #2017-302 would allow in Ranson would generally reduce the flexibility of local economies in Jefferson County. Historically, the driving industries in Jefferson County have been tourism, agriculture, and the equine industries. These three industries are large conglomerates of small businesses. Small business is very important

to Shepherdstown. Small businesses have been shown to create more jobs, cultivate more innovation, and provide more opportunities than big, non-local firms. Additionally, small businesses have been shown to be more reactive to sudden changes relative to manufacturing businesses. Bringing large, manufacturing-based industry into Jefferson county will depress the local economy and stifle innovation. During this time of economic upheaval and uncertainty, Jefferson County needs to support industries that will allow local economies to adapt and recover as fast as possible.

Voting no on ordinance #2017-302 will help protect water resources throughout Jefferson County. The type of industry that ordinance #2017-302 would allow puts the ground resources of Jefferson county at significant risk due to the karst hydrogeology. The site in Ranson is in the Rocky Marsh Run watershed, which is in the source water protection zone for Shepherdstown and drains to the Potomac River. Therefore, activity at this site will affect both groundwater and surface water streams. In municipalities like Shepherdstown, many residents and nearby farms depend on wells for water. Contamination of groundwater aquifers would create both health and remediation concerns for local residents. Dye tests performed by the USGS near the area of proposed rezoning in Ranson have shown just how far-reaching groundwater contamination at the Ranson site could be. Results from the USGS study revealed measurable dye concentrations in Elk's Run, Rattlesnake Run, and even the Shepherdstown Town Run. This last run cuts through the center of Shepherdstown and is a favorite area for children to play and learn to fish. In this way, the industry that this zoning change will allow will adversely affect the safety of our community.

Groundwater pollution is not the only concern for communities like Shepherdstown. The type of industry that ordinance #2017-302 would allow in Ranson would also generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. These pollutants are particularly harmful to children. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. The site in Ranson is across the road from an elementary school and also within the Jefferson High Middle district. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of children in Shepherdstown and all of Jefferson County. In this way, the industry that this zoning change will provide for will adversely affect the health of our community.

I again request that you vote no on ordinance #2017-302. This zoning change will allow industry that will adversely affect the health, safety, and welfare of our community. The long-term economic, environmental, and community health of municipalities like Shepherdstown depend on Ranson's participation in a coordinated zoning plan for all of Jefferson County.

Sincerely,

Rachel Lachow

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask you to vote NO on Ordinance #2017-302. The industry this zoning change will allow for endangers the health, safety and, welfare of the community, and violates the premise of the smart code zoning that we have spent so much time, effort and federal money employing.

Any change in zoning needs to align with the comprehensive plan. In Ranson's current comprehensive plan (2012), the city only refers to "heavy industry" in the history section. Here it is characterized as part of a bygone era that has been replaced by an emphasis on agriculture for local food production, open spaces, and quality-of-life. In the remainder of the document, the word industry is used loosely to describe businesses including flower shops and shoe stores. Nothing that resembles the industry that this zoning change will provide for is described in the current comprehensive plan of Ranson.

In the land use section of the comprehensive plan, number ten states:

"Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The comprehensive plan clearly states that the city will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community. This change in zoning clearly negatively affects the health, safety, and welfare of the community.

As the zoning is proposed, the industry that this zoning change will allow for will be directly across the street from houses, parks and other small businesses. A densely populated subdivision and an elementary school already exit directly across the street. While these latter

community sections are not in the city limits, the effect of this zoning on them should still be considered just the same as it would be if they were in the city limits.

The industry that this zoning change will provide for will produce particulate, gaseous, and hazardous air emissions. These emissions have been shown to be detrimental to human health at every stage of life from embryo to old age. In utero and childhood exposure are the most damaging with lasting effects being realized through out life, and with maternal exposure the effects can be felt for generations. Multiple organ systems are affected including respiratory, cardiovascular, neurologic, immune, and endocrine causing defects in multiple processes including in utero development, neurodevelopment, immune and tolerance development, and cognitive defects. There are also psychological, social, and economic effects from both perceived and actual air pollution in both children and adults. Many of these effects can be seen even with short-term exposure or exposure that is lower than the levels recommended by the US Environmental Protection Agency and World Health Organization. These consequences are devastating to the individual and depressing to the local community and economy. State law does not allow a school to be built next to industry that this zoning will allow but yet we are contemplating changing the zoning so this industry can build next to a school. This does not make sense. As Ranson residents, we want Ranson to follow the lead of the state and keep polluting industry away from kids. In these ways, this change in zoning will negatively affect the health and welfare of the community.

In addition to the health effects of the air emissions is the threat to groundwater from the industry that this zoning change would allow. The land in question has karst hydrogeology and therefore very high aquifer vulnerability and is not appropriate for this industry. With the type of industry this zoning will provide for, combined with high aquifer vulnerability, the likelihood of groundwater contamination is too high for the community and region to bear. A USGS study demonstrated that contamination in the groundwater adjacent to the site moves relatively quickly and can be found in wells and surface water structures in a variety of locations in the County. In this way, contamination at the site would affect the drinking water of the great majority of Jefferson County residents. Through the surface water connections, the water at the site also affects the water resources of the region.

Aquifer vulnerability has been used by policy makers for decades to set land use regulations. The guiding document, from the WVDEP, Stormwater Management Design in Karst Areas states, "it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." In Ranson, we need to follow this advice and not change the zoning of this land for use by industry that has among the highest aquifer vulnerability in the County. This zoning change will endanger the safety of the community and region by endangering the safe water resources. As Ranson residents, we want to safeguard the water resources of the county and region by following the WVDEP guidance here.

Further, by reallocating this transect district and replacing it with a monolithic block of Special District Industrial designation, hundreds of housing units, parks and space for small businesses are lost. Ranson loses the potential for property tax on these properties and their improvements, Business and Occupational tax on the businesses and sales tax in retail stores. The community loses out on the opportunity to develop affordable housing and create locations where people can live, work, play, and shop all in the same place reducing the need for travel.

Worse yet apparently a deal has been made where the entity that owns the subject land has required that a litany of things not be built on the adjacent land essentially stripping the purpose of the smart code transect zone that exists there. Transect zones in the smart code are meant to transition, from out to in, and provide communities where people can safely work and live in close proximity in an effort to reduce travel. Excluding many of the components of the transect zone effectively eliminates the features that make it a transect zone, thus, losing the benefits a transect zone offers the community and city. By losing these benefits, reducing the overall and affordable housing prospects, and reducing so drastically the opportunities for city income, this zoning change will negatively affect the welfare of the community.

As Ranson residents, we find it odd that we are changing zoning to provide for industry that we would not put in the middle of our town close to our residents, but we are placing it close to the homes of county residents. Further, it is striking that the area where this change in zoning is directly adjacent to historically underserved lower income communities and a Title I school. This amounts to environmental injustice and cannot be tolerated.

The purpose of zoning is for a city to protect the health, welfare, morals and safety of the community. In this case, the air emissions and heavy truck traffic will endanger the communities' health. The threat of water contamination will endanger the safety of the community. The effect of lost productivity and decreased workforce participation due to increased illness and the negative effect the air emissions and presence of such a factory will have on the local economy will negatively affect the welfare of the community. The environmental injustice of changing the zoning to accommodate such polluting industry in a location where your municipality has no residents, but yet hundreds of low income and underserved county residents live is egregiously amoral. This must not happen. We respectfully implore you to do the right thing and vote no on ordinance #2017-302.

Sincerely,

Bryan Trujillo

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Julia Metzger-Traber

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Grant Ramsburg

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that will significantly harm the municipalities within Jefferson County and beyond effecting the health, welfare, and safety of our community. Harpers Ferry is a national treasure with the natural and historic resources tours flock to see each year and one of the communities that will be negatively impacted by this zoning change.

According to a 2019 study by the West Virginia Tourism Office, Jefferson County generated an average of \$178 million per year in tourism-derived revenue for state and local governments over the last 10 years, more than any other county in West Virginia by at least double. Tourism benefits the businesses and economy of Ranson and Jefferson County producing \$213.7 million in individual earning, 7040 jobs, and \$842.6 million in direct spending here in 2018. We would need 40 Project Shuttles to replace the individual earnings and 59 Rockwools to replace the jobs provided by the tourism industry in Jefferson County. It is important to note that most of the money generated by tourism in Jefferson County comes from neighboring states. In this way, it is like an export: not simply recycling money, but bringing money into the state increasing its wealth. Much of the economy in Harpers Ferry is based on this tourism industry. A threat to this industry poses a threat to the economy and welfare of our community.

One of the important drivers for tourism in Harpers Ferry is the Appalachian Trail. According to the Appalachian Trail Conservancy (ATC), Harpers Ferry is the psychologic midpoint of the Trail, and hikers often plan extended stays in Jefferson County with an obvious positive impact. The ATC reports that the smokestacks and associated lights will be visible in the viewshed of 15 vistas on the Appalachian Trail (AT). Studies have shown that quality of vistas and human impact on the environment are not only noticed by visitors, but effect their experience. Another study published in the Journal of Applied Recreation Research, found that points of interests and views drew visitors' attention and had a significant impact on their perception of the trail. It was also found that particularly beautiful vistas helped visitors overlook elements

that usually have a negative effect on trail experience like increased trail traffic. A 2009 study in Leisure Sciences revealed that scenic value was a perceptual theme of Appalachian Trail visitors, and that things as simple as dead trees visible in a vista can have a negative impact on visitors' overall perception. Imagine the effect the smokestacks will have from the 15 vistas from which they will be visible. The introduction of industrial activity made possible by the proposed rezoning in Ranson would have a negative effect on the scenic views of beautiful landscapes from the Appalachian Trail in Jefferson County.

The smokestacks are not all visitors will be able to see — the air pollution will create haze. The effect of regional haze on tourists was explored in a review article published in the Atmospheric Environment titled "Impaired visibility: the air pollution people see." A key takeaway on the negative affect of haze on vacationing tourists was summarized as follows:

"Vacations offer an escape from the routine and stress of our daily lives. Vacation destinations are often chosen based on their scenery; vacations are spent gazing at monuments, mountains, clouds, and oceans. Good visibility allows clear observation of distant features and appreciation of the inherent beauty of these scenes...Air pollution, which is often present in both our cities and parks, interferes with these attributes and can ruin the views vacationers travel to enjoy."

People seek bucolic, unspoiled areas to escape the stresses of urban areas. A 2004 study in Environment and Behavior found perceived pollution causes stress while viewing natural scenes has both psychological and physiological benefits, and a 2007 study confirmed these benefits. Two other studies found that people are emotionally affected by poor visibility, and tourists are disappointed when views are obscured by haze.

The combination of smokestacks and haze will mar the viewshed and will not only reduce the positive effects of a scenic landscape but also leave tourists disappointed and dissatisfied with their choice of destination. With these effects the welfare of the Harpers Ferry community would undoubtedly be endangered by the industry that this zoning change will provide for.

Multiple studies by doctors Kozar, Doctor, and Doctor have demonstrated that the land at this site to be rezoned is Karst with the highest likelihood of sinkhole development in the county, and that the groundwater aquifer there is incredibly sensitive to contamination from surface water. Further, this site is on an upland plain with relatively few surface streams, seasonal variability in the water table that results in numerous estavelles, and large amounts of water in the epikarst. In this area contamination in surface water communicates easily to the water in the epikarst via diffuse and point infiltration, and the springs at the margins of the upland area are directly affected by the water quality throughout the aquifer. According to Jefferson Orchards Voluntary Remediation Plan with the WVDEP, the groundwater at the site is approximately 60 feet below the ground, and the tests performed by the USGS have shown that groundwater from just adjacent to this site emerged in the headwaters of both the Elk's Run and Rattlesnake Run. This is critically important for Harpers Ferry because the Elk's Run headwaters is a spring about three miles southeast of the site and goes on to become the drinking water source for Harpers Ferry and Bolivar before emptying into the Potomac River.

The headwaters of Rattlesnake Run is a spring about 3.5 miles from the site and is also a tributary of the Potomac River. The Potomac River is the back up water source for Harpers Ferry. This means that the activity at the site will have a critical influence on the drinking water of Harpers Ferry. In this was the industry permitted by this change in zoning would undoubtedly endanger the health and safety of the community in Harpers Ferry.

The untoward health effects and individual economic consequences from the pollution emissions of the industry this rezoning will allow that will be born out over the length of people's lives and that of their decedents for at least three generations is an egregious example of environmental injustice that should not be tolerated. This zoning change may be in one of the poorest sections of the county, but the effects will be felt in every part of Ranson and the county.

The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." The industry that this rezoning will allow will jeopardize the health, safety and welfare of Ranson, Harpers Ferry and the whole county. Please vote no on the ordinance #2017-302.

Sincerely,

Shane Butcher

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask you to vote NO on Ordinance #2017-302. The industry this zoning change will allow for endangers the health, safety and, welfare of the community, and violates the premise of the smart code zoning that we have spent so much time, effort and federal money employing.

Any change in zoning needs to align with the comprehensive plan. In Ranson's current comprehensive plan (2012), the city only refers to "heavy industry" in the history section. Here it is characterized as part of a bygone era that has been replaced by an emphasis on agriculture for local food production, open spaces, and quality-of-life. In the remainder of the document, the word industry is used loosely to describe businesses including flower shops and shoe stores. Nothing that resembles the industry that this zoning change will provide for is described in the current comprehensive plan of Ranson.

In the land use section of the comprehensive plan, number ten states:

"Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The comprehensive plan clearly states that the city will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community. This change in zoning clearly negatively affects the health, safety, and welfare of the community.

As the zoning is proposed, the industry that this zoning change will allow for will be directly across the street from houses, parks and other small businesses. A densely populated subdivision and an elementary school already exit directly across the street. While these latter

community sections are not in the city limits, the effect of this zoning on them should still be considered just the same as it would be if they were in the city limits.

The industry that this zoning change will provide for will produce particulate, gaseous, and hazardous air emissions. These emissions have been shown to be detrimental to human health at every stage of life from embryo to old age. In utero and childhood exposure are the most damaging with lasting effects being realized through out life, and with maternal exposure the effects can be felt for generations. Multiple organ systems are affected including respiratory, cardiovascular, neurologic, immune, and endocrine causing defects in multiple processes including in utero development, neurodevelopment, immune and tolerance development, and cognitive defects. There are also psychological, social, and economic effects from both perceived and actual air pollution in both children and adults. Many of these effects can be seen even with short-term exposure or exposure that is lower than the levels recommended by the US Environmental Protection Agency and World Health Organization. These consequences are devastating to the individual and depressing to the local community and economy. State law does not allow a school to be built next to industry that this zoning will allow but yet we are contemplating changing the zoning so this industry can build next to a school. This does not make sense. As Ranson residents, we want Ranson to follow the lead of the state and keep polluting industry away from kids. In these ways, this change in zoning will negatively affect the health and welfare of the community.

In addition to the health effects of the air emissions is the threat to groundwater from the industry that this zoning change would allow. The land in question has karst hydrogeology and therefore very high aquifer vulnerability and is not appropriate for this industry. With the type of industry this zoning will provide for, combined with high aquifer vulnerability, the likelihood of groundwater contamination is too high for the community and region to bear. A USGS study demonstrated that contamination in the groundwater adjacent to the site moves relatively quickly and can be found in wells and surface water structures in a variety of locations in the County. In this way, contamination at the site would affect the drinking water of the great majority of Jefferson County residents. Through the surface water connections, the water at the site also affects the water resources of the region.

Aquifer vulnerability has been used by policy makers for decades to set land use regulations. The guiding document, from the WVDEP, Stormwater Management Design in Karst Areas states, "it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." In Ranson, we need to follow this advice and not change the zoning of this land for use by industry that has among the highest aquifer vulnerability in the County. This zoning change will endanger the safety of the community and region by endangering the safe water resources. As Ranson residents, we want to safeguard the water resources of the county and region by following the WVDEP guidance here.

Further, by reallocating this transect district and replacing it with a monolithic block of Special District Industrial designation, hundreds of housing units, parks and space for small businesses are lost. Ranson loses the potential for property tax on these properties and their improvements, Business and Occupational tax on the businesses and sales tax in retail stores. The community loses out on the opportunity to develop affordable housing and create locations where people can live, work, play, and shop all in the same place reducing the need for travel.

Worse yet apparently a deal has been made where the entity that owns the subject land has required that a litany of things not be built on the adjacent land essentially stripping the purpose of the smart code transect zone that exists there. Transect zones in the smart code are meant to transition, from out to in, and provide communities where people can safely work and live in close proximity in an effort to reduce travel. Excluding many of the components of the transect zone effectively eliminates the features that make it a transect zone, thus, losing the benefits a transect zone offers the community and city. By losing these benefits, reducing the overall and affordable housing prospects, and reducing so drastically the opportunities for city income, this zoning change will negatively affect the welfare of the community.

As Ranson residents, we find it odd that we are changing zoning to provide for industry that we would not put in the middle of our town close to our residents, but we are placing it close to the homes of county residents. Further, it is striking that the area where this change in zoning is directly adjacent to historically underserved lower income communities and a Title I school. This amounts to environmental injustice and cannot be tolerated.

The purpose of zoning is for a city to protect the health, welfare, morals and safety of the community. In this case, the air emissions and heavy truck traffic will endanger the communities' health. The threat of water contamination will endanger the safety of the community. The effect of lost productivity and decreased workforce participation due to increased illness and the negative effect the air emissions and presence of such a factory will have on the local economy will negatively affect the welfare of the community. The environmental injustice of changing the zoning to accommodate such polluting industry in a location where your municipality has no residents, but yet hundreds of low income and underserved county residents live is egregiously amoral. This must not happen. We respectfully implore you to do the right thing and vote no on ordinance #2017-302.

Sincerely,

Linda Smith

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Sarah Phillips

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

We live very close to the proposed Rockwool site. My wife suffers severe asthma and would be harmed by the plants emissions.

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask that you vote no on Ordinance #2017-302. While not in Ranson, the land and homes around the property that is the subject of the zoning change are closer to the property than anyone who currently lives within the city limits of Ranson. This area will be affected sooner and more harshly by the environmental issues that will develop secondary to the inappropriate siting of industry this zoning would allow.

The subject land has been well studied by Drs. Kozar, Doctor and Doctor and described in the scientific literature and USGS reports as having karst hydrology with very high aquifer vulnerability. The karst landscape is a consequence of the presence of soluble bedrock, which consists of limestone in the case of the subject land. In such landscapes water percolates through the ground and dissolves the underlying rock creating a porous network of caverns and throughways. Karst aquifers are known to be "extremely vulnerable to pollution" due to direct connection between the surface water and groundwater through both point (sinkholes) and diffuse (everywhere) infiltration. It is known from the Voluntary Remediation Plan of Jefferson Orchard that the groundwater at the subject site is only 60 feet below the ground. The subject property and much of the property around it are on an upland plain with few surface streams, but great seasonal variability in the water table resulting in numerous esteves and large amounts of water in the epikarst. This water is easily contaminated and this contamination spreads quickly throughout the aquifer. Dye tests performed near the subject site by the USGS have demonstrated this quick moving thorough dispersment in the aquifer in this area. While this contamination goes on to affect springs at the margins of the upland area continuing on in streams that service municipal water sources and the Potomac River, our concerns are far more immediate in both time and distance. Well water is the only water source available in the area of the proposed zoning change and, with the exception of Fox Glen, a majority of this water is

supplied by private wells. Therefore, the groundwater aquifer fulfills a critical necessity, fulfilling all needs including human consumption, household uses, and agriculture and maintenance of livestock and horses in the immediate area around the site. The concern is that if the aquifer becomes contaminated, then the local drinking water will be fouled.

For decades now, policy makers have been using “Aquifer Vulnerability,” to set land use and water resource protection policy. Karst has very high Aquifer Vulnerability. Therefore, this industrial use is not appropriate for this land and it should not be zoned for it. The guiding documents of the WVDEP recognize this. The introduction to the WVDEP document Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.”

The Chesapeake Bay Stormwater Network karst stormwater guidance document the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed, which the WVDEP cites in its own guiding document Stormwater Management Design in Karst Areas, clearly agrees stating:

“First, the effect of land development on karst terrain is complex and hard to predict, and requires professional analysis to reduce the risk of geological hazards, damage to infrastructure and groundwater contamination.” “The working group acknowledges that past approaches to stormwater and land development in karst terrain have been inadequate to safeguard the public and the environment.” “...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” We clearly need stronger comprehensive land use plans and zoning that direct new growth away from karst areas to more appropriate locations. Ordinance #2017-302 is literally the opposite of this.

Further, we cannot rely on the WVDEP to do the job that good local land use guidelines and zoning should do. For example, the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed states that detention and retention ponds are not recommended on karst and categorize them as discouraged. Also, quoting WVDEP’s own karst guidance: “attenuating surface runoff will increase the rate of sinkhole formation and potential groundwater contamination.” Yet the entity currently planning to utilize this zoning change is planning employment of multiple massive retention ponds and attenuating surface runoff completely. This has already been approved by the DEP in two Construction Stormwater General Permit registrations for that company. One of detention ponds is not even regulated by the DEP as it contains process water and has no outlet. Clearly the DEP recognizes the risks but is not appropriately limiting them. Relying on the DEP to protect the public health, safety, welfare, and the environment from any entity in these karst locations is simply as the CNS bulletin said it “inadequate to safeguard the public and the environment.” We must have appropriate zoning that takes into consideration appropriate use of land with karst

hydrogeology. Ordinance #2017-302 does not do this, but instead increases the risk to the public and the environment.

A second serious concern is the air emissions from the industry that this zoning will provide for. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. These types of air emissions have been shown to increase the risk of, contribute to, and exacerbate a multitude of developmental, physical, physiological, physiological, cognitive and economic. The exposure of one individual can cause repercussions in multiple generations. Embryos, fetuses, and children are most vulnerable with effects born out over a lifetime, and that of their offspring. Many of these effects only require short-term exposure and some have even been shown to occur at levels below current limits recommended by the World Health Organization. One example of this is that a recent study found that “Even within the limits set by the World Health Organization, the pollutants PM₁₀, SO₂, NO₂, and O₃ are associated with increased risk of treatment for respiratory diseases in children 0 to 6 years of age.” Unfortunately, the US limits are higher than WHO, 300 % higher in the case of PM₁₀!

In fact, in 2019, in the Advice from the Independent Particulate Matter Review Panel (formerly U.S. EPA Clean Air Scientific Advisory Committee Particulate Matter Review Panel) on EPA’s Policy Assessment for the Review of the National Ambient Air Quality Standards for Particulate Matter, it stated that the committee unanimously and unequivocally found that the current primary annual and 24-hour PM_{2.5} National Ambient Air Quality Standards (NAAQS) are not adequate to protect public health. The advice from this 20-member committee, whose scientific disciplines include epidemiology, medicine, toxicology, air quality measurement, air quality modeling, exposure assessment measurement and modeling, risk assessment, statistics, and others, was ignored due presumably to political pressure. Not only are the NAAQS too high in some cases, but due to the measure and mechanism by which they work, they can not replace the safety provided by good land use and zoning regulations, that are meant to do things like keep factories with air emissions and hundreds of heavy trucks away from elementary schools. In fact, there is a state law that prohibits siting a school near a factory. Unfortunately, the reciprocal law does not exist. Clearly, just like with the water resources, we cannot rely on the DEP or the EPA to do the job of what appropriate zoning should do. The whole point of zoning is to keep people safe and provide for their health and welfare. Ordinance #2017-302 puts families and school children directly in harms way.

The air emissions, threat to the groundwater, and the very presence of the industry that this zoning change will allow for will have a serious negative economic effect on those who live and or work closest to the site in question. Productivity and workforce participation will be negatively affected by the health effects of the air emissions. The local agricultural operations will be negatively affected by the air emissions with lower quantity and quality of crop yield and would be devastated if the ground water aquifer were fouled. The equine operations in the area, of which there are several, will be negatively affected by the air emissions as they affect the horses’ health and performance. The mere presence of the industry that will be provided

for by this zoning change will cause property values to fall. There will be serious economic consequences for the immediate area around the site in question.

Several of the communities in the immediate area of the site for proposed zoning change are traditionally underserved and have lower economic status. The choice of this location for such a zoning change represents an egregious example of environmental injustice that should not be promulgated or tolerated.

This zoning change will provide for industry that will negatively affect the health safety and welfare of our community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Paul Denchy

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Kai Finlay

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would negatively affect tourism, economic agility, groundwater quality, and individual health in neighboring municipalities like Shepherdstown. In doing these things the industry that this zoning change provides for will adversely affect the health, safety, and welfare of our community.

Tourism is critically important to Shepherdstown's economy and to the county as a whole. In 2018, tourist spending in the Jefferson County contributed over \$170 million to state and local government revenue and \$213 million in individual earnings. Importantly, most of this money comes from tourists visiting from neighboring states like Virginia, Maryland, and Washington D.C. Out-of-state tourists are largely drawn to Jefferson County because of its reputation for environmental-friendly, sustainable industry. Key elements that support this reputation include the county's pastoral scenery and pristine natural resources. Ordinance #2017-302 will allow industry into Jefferson County that risks harming these elements and dramatically reducing the area's appeal to visitors. The resulting harm to our tourist industry would drive away visitors and decrease state, county, and local revenue. The long-term success of Jefferson County's tourism industry is dependent on local governments making coordinated zoning decisions. Allowing certain types in industry in Ranson will negatively affect tourism in every municipality throughout the county, including Shepherdstown. Voting no on ordinance #2017-302 will protect the foundations of the county's tourism industry and protect the 7,040 jobs in Jefferson County that are directly supported by tourism. In this way the industry this zoning change will allow will adversely affect the welfare of our community.

The type of large, consolidated industry that ordinance #2017-302 would allow in Ranson would generally reduce the flexibility of local economies in Jefferson County. Historically, the driving industries in Jefferson County have been tourism, agriculture, and the equine industries. These three industries are large conglomerates of small businesses. Small business is very important

to Shepherdstown. Small businesses have been shown to create more jobs, cultivate more innovation, and provide more opportunities than big, non-local firms. Additionally, small businesses have been shown to be more reactive to sudden changes relative to manufacturing businesses. Bringing large, manufacturing-based industry into Jefferson county will depress the local economy and stifle innovation. During this time of economic upheaval and uncertainty, Jefferson County needs to support industries that will allow local economies to adapt and recover as fast as possible.

Voting no on ordinance #2017-302 will help protect water resources throughout Jefferson County. The type of industry that ordinance #2017-302 would allow puts the ground resources of Jefferson county at significant risk due to the karst hydrogeology. The site in Ranson is in the Rocky Marsh Run watershed, which is in the source water protection zone for Shepherdstown and drains to the Potomac River. Therefore, activity at this site will affect both groundwater and surface water streams. In municipalities like Shepherdstown, many residents and nearby farms depend on wells for water. Contamination of groundwater aquifers would create both health and remediation concerns for local residents. Dye tests performed by the USGS near the area of proposed rezoning in Ranson have shown just how far-reaching groundwater contamination at the Ranson site could be. Results from the USGS study revealed measurable dye concentrations in Elk's Run, Rattlesnake Run, and even the Shepherdstown Town Run. This last run cuts through the center of Shepherdstown and is a favorite area for children to play and learn to fish. In this way, the industry that this zoning change will allow will adversely affect the safety of our community.

Groundwater pollution is not the only concern for communities like Shepherdstown. The type of industry that ordinance #2017-302 would allow in Ranson would also generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. These pollutants are particularly harmful to children. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. The site in Ranson is across the road from an elementary school and also within the Jefferson High Middle district. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of children in Shepherdstown and all of Jefferson County. In this way, the industry that this zoning change will provide for will adversely affect the health of our community.

I again request that you vote no on ordinance #2017-302. This zoning change will allow industry that will adversely affect the health, safety, and welfare of our community. The long-term economic, environmental, and community health of municipalities like Shepherdstown depend on Ranson's participation in a coordinated zoning plan for all of Jefferson County.

Sincerely,

Michelle Kwiatkowski

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I am urging the City of Ranson to vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to adhere to the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will allow, produces significant amounts of atmospheric pollution. The very location of this industrial location is within a mile of public schools. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants containing significant amounts of substances known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community, and is not in keeping with the intentions of the city's comprehensive plan. When there are inversions, the industry will add increases in noxious gasses and pollutants that would also increase particulates, further degrading air quality and creating potential health hazards.

The economic impact of this industry threatens to harm the existing industries that are the pillars of our economy. The jobs it will generate and revenue it will produce will not offset the economic harms it poses to the City and surrounding communities. Through a combination of visibility in the county and the pollution it produces this industry poses significant harm to the racetrack, local agriculture, tourism and current attractiveness for residential development. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the degradation of air quality and will also see decreasing return on investment, cash flow, and overall earnings. This industry would be an eyesore, visible from many locations in the county; the haze will affect visibility and view, and both will have a negative effect on perceived sustainability that is so attractive to tourists. These effects will result in a decrease in tourism and again, decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company, hired by Thrasher Engineering for Rockwool, warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County; private wells and public drinking water systems will be permanently impacted, and the levels of treatment will increase costs. This rezoning will undeniably endanger the safety of the community. This risk alone should be enough to deny this amendment. Because of the nature of karst topography, there are no safeguards that can be put in place to protect the groundwater that would normally be implemented in other geologic settings.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more

appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, I strongly urge the council to vote no on the zoning change, ordinance #2017-302.

Respectfully,

Lisa Payne

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Diana Mullis

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I am a lifelong Jefferson County resident. I was very disappointed that Economic Development Authority invited heavy industry into the county. Jefferson County is strong enough economically to do without the so called benefits from Rockwool operating here. We have history, we have tourism, we have agriculture. HEAVY INDUSTRY DOESN'T BELING HERE! I am also ashamed of the county leadership for allowing heavy industry so close to several schools. West Virginia has a long history of allowing companies to take advantage of its citizens. I thought Jefferson County was better than that.

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would negatively affect tourism, economic agility, groundwater quality, and individual health in neighboring municipalities like Shepherdstown. In doing these things the industry that this zoning change provides for will adversely affect the health, safety, and welfare of our community.

Tourism is critically important to Shepherdstown's economy and to the county as a whole. In 2018, tourist spending in the Jefferson County contributed over \$170 million to state and local government revenue and \$213 million in individual earnings. Importantly, most of this money comes from tourists visiting from neighboring states like Virginia, Maryland, and Washington D.C. Out-of-state tourists are largely drawn to Jefferson County because of its reputation for environmental-friendly, sustainable industry. Key elements that support this reputation include the county's pastoral scenery and pristine natural resources. Ordinance #2017-302 will allow industry into Jefferson County that risks harming these elements and dramatically reducing the area's appeal to visitors. The resulting harm to our tourist industry would drive away visitors and decrease state, county, and local revenue. The long-term success of Jefferson County's tourism industry is dependent on local governments making coordinated zoning decisions. Allowing certain types in industry in Ranson will negatively affect tourism in every municipality throughout the county, including Shepherdstown. Voting no on ordinance #2017-302 will

protect the foundations of the county's tourism industry and protect the 7,040 jobs in Jefferson County that are directly supported by tourism. In this way the industry this zoning change will allow will adversely affect the welfare of our community.

The type of large, consolidated industry that ordinance #2017-302 would allow in Ranson would generally reduce the flexibility of local economies in Jefferson County. Historically, the driving industries in Jefferson County have been tourism, agriculture, and the equine industries. These three industries are large conglomerates of small businesses. Small business is very important to Shepherdstown. Small businesses have been shown to create more jobs, cultivate more innovation, and provide more opportunities than big, non-local firms. Additionally, small businesses have been shown to be more reactive to sudden changes relative to manufacturing businesses. Bringing large, manufacturing-based industry into Jefferson county will depress the local economy and stifle innovation. During this time of economic upheaval and uncertainty, Jefferson County needs to support industries that will allow local economies to adapt and recover as fast as possible.

Voting no on ordinance #2017-302 will help protect water resources throughout Jefferson County. The type of industry that ordinance #2017-302 would allow puts the ground resources of Jefferson county at significant risk due to the karst hydrogeology. The site in Ranson is in the Rocky Marsh Run watershed, which is in the source water protection zone for Shepherdstown and drains to the Potomac River. Therefore, activity at this site will affect both groundwater and surface water streams. In municipalities like Shepherdstown, many residents and nearby farms depend on wells for water. Contamination of groundwater aquifers would create both health and remediation concerns for local residents. Dye tests performed by the USGS near the area of proposed rezoning in Ranson have shown just how far-reaching groundwater contamination at the Ranson site could be. Results from the USGS study revealed measurable dye concentrations in Elk's Run, Rattlesnake Run, and even the Shepherdstown Town Run. This last run cuts through the center of Shepherdstown and is a favorite area for children to play and learn to fish. In this way, the industry that this zoning change will allow will adversely affect the safety of our community.

Groundwater pollution is not the only concern for communities like Shepherdstown. The type of industry that ordinance #2017-302 would allow in Ranson would also generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. These pollutants are particularly harmful to children. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. The site in Ranson is across the road from an elementary school and also within the Jefferson High Middle district. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of children in Shepherdstown and all of Jefferson County. In this way, the industry that this zoning change will provide for will adversely affect the health of our community.

I again request that you vote no on ordinance #2017-302. This zoning change will allow industry that will adversely affect the health, safety, and welfare of our community. The long-term

economic, environmental, and community health of municipalities like Shepherdstown depend on Ranson's participation in a coordinated zoning plan for all of Jefferson County.

Sincerely,

Kata Sharrer
Shepherdstown , 25443

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would put at risk the health and well being of children of Jefferson County.

The type of industry that ordinance #2017-302 would allow in Ranson would generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. Exposure to these pollutants has devastating effects on children's health. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. Developing fetuses whose mothers are exposed to air pollution are more likely to have impaired organ development which can lead to early cognitive deficits, neurodevelopmental defects and other physical, cognitive, and psychological deficits later in life. An association between autism and prenatal exposure to particulate matter in air pollution has been demonstrated in several studies. Many studies have shown that lower test scores in math, English, and language arts are associated with exposure to outdoor air pollution. Industrial activity allowed by ordinance #2017-302 would also increase the risk of groundwater contamination in Ranson and nearby municipalities. Children whose families rely on well water, as is the case in much of Jefferson County, may be affected by polluted water. Voting no on ordinance #2017-302 will prevent air and water pollution from negatively affecting the long-term health of children in Jefferson County and surrounding areas.

The economic and environmental harm caused by the type of industry that ordinance #2017-302 would allow would put additional stress on the parents, caretakers, and teachers of children in affected areas. The weakening and destabilizing of this support network would have negative effects on local children. Many households in Jefferson County depend on the local agriculture, tourism, and equine industries for income. If industrial activity in Ranson depresses these industries, the resulting financial strain on these households will introduce additional stress and uncertainty into children's lives. Households living in areas affected by particulate

matter and regional haze will also suffer from the psychological effects of air pollution. Individuals living in areas with increase perception of pollution show increased levels of stress, anxiety, and unhappiness. School districts affected by increased air and water pollution may have trouble recruiting and retaining teachers. Teachers have a large influence on a child's daily life and, if educator quality and tenure decreases, the quality of this influence will diminish.

The site of the proposed rezoning in Ranson is across the road from an elementary school and proximal to lower-income neighborhoods. Observations like these demonstrate how ordinance #2017-302 would disproportionately affect vulnerable and historically-disadvantaged populations. The damaging health effects of air pollution have been shown to persist for at least three generations, so allowing certain types of industry in low-income areas would only compound existing disadvantages. Voting no on ordinance #2017-302 would be a step towards acknowledging that all individuals have the right to clean air and water.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." This zoning change would clearly adversely affect the health, safety, and welfare of the community. Children face increased exposure to air pollution adversely affecting their health, financial instability adversely affecting their welfare, groundwater contamination adversely affecting their safety, and environmental injustice and discrimination if ordinance #2017-302 is passed. Educators will face increased air pollution adversely affecting their health and consequently welfare. These adverse effects are all against Ranson's Comprehensive Plan. Please vote NO on Ordinance #2017-302.

Sincerely,

Linda Gibson

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote NO on Ordinance #2017-302. This rezoning will put an undue hardship on the wastewater treatment systems, burden the ratepayers and risk surface waterways in Charles Town, risking the health, safety, and welfare of the community. The comprehensive plan of Ranson states the City "will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community." Therefore, please vote NO on #2017-302.

The nature of the industry that this zoning will allow will be harmful to our local economy. Charles Town has spent a lot of time and money improving our downtown area for restaurants and retail. We are working to take advantage of the tourism industry in our county and bring more people into Charles Town. The eyesore, noise pollution, air pollution, and obvious move away from sustainability will drive people away from Jefferson County and Charles Town, rendering our efforts ineffective and unrewarding. This will make it harder for our small businesses to be successful. In this way, the industry this zoning will adversely affect the welfare of our community.

According to the 2018 WVU economic study of the eastern panhandle, over 40% of the workforce in Jefferson County choose to work outside of the state. These commuters bring that money home and spend it here supporting our local small businesses, economy, and government. Charles Town has a large number of residents who commute. These typically higher earners may choose to leave the area because of the presence of the industry that this zoning change would provide. This will cause hardship for our economy and municipality. The industry this zoning will provide will adversely affect the welfare of our community.

The industry that this zoning will allow will cause stress for multiple reasons on the Charles Town wastewater treatment systems and the surface waterways in Jefferson County and beyond. The industry currently planning to utilize the zoning change will have discharged to the

wastewater system that is high in chloride, primarily from its water softening system. The NPDES permit modification allows up to 5,000 mg/L. Chloride is not settled or removed at the wastewater treatment plant. It cannot be removed by conventional means and would be prohibitively expensive to do by new technology. This is of concern to Charles Town because chloride can harm stream water and also impair the functioning of the wastewater treatment plant. Furthermore, the corrosive nature of chloride can cause damage to pipes both in the wastewater system and those used by downstream drinking water systems, like the \$207 million Trap Rock Water Treatment plant in Loudoun.

The human health criteria for chloride under WV standards is 250 mg/L. Under low streamflow conditions, chloride additions to the treatment plant effluent, as proposed by the industry currently planning to utilize the zoning change, could cause chloride levels in Evitts Run to exceed this standard. If the amount of chloride increased due to expansion or higher throughput, then this human health standard would be violated frequently. Chlorides are also known to harm aquatic life and affect metal toxicity in rivers. The USEPA and several states have surface water guidelines of 230mg/L for chronic exposure. This would also pose a risk of damaging the water treatment facilities downstream on the Potomac River.

A research study by Lefebvre and Moletta in 2006 showed that chloride and salinity impair the ability of wastewater treatment to remove phosphorus and nitrogen, and because of this, other states have introduced legislation to treat saline wastewater. Uygur and Kargi in 2004 looked at the effects of salt on synthetic wastewater treatment. They found that the removal of both nitrogen and phosphorus was reduced when salinity increased from 0 to 6%. In fact, the removal efficiency of ammonia dropped from 96% to 39% with this increasing salinity. Hong et al. In 2016 found phosphorous removal decreased 20-28% when chloride concentrations went from 150 mg/L to 1,500 mg/L. Phosphorous removal was completely inhibited at concentrations greater than 2,500 mg/L. This increased salinity has the potential to make the Charles Town wastewater treatment system work far less efficiently.

In addition to the contents of the wastewater this type of industry will produce, the volume of sewage is itself a concern. Given that the City of Charles Town has been in violation of its permit on numerous occasions for spills and overflow of untreated sewage, adding large volumes of wastewater will further challenge the near-capacity system. This will mean that costly capacity upgrades will need to be done likely sooner than they would have needed to be done, imposing further financial strain on the system. Through these effects, the industry this zoning will provide will adversely affect the health, safety, and welfare of the community.

This zoning change will provide for an industry the likes of which are not present in this county and have not been present in this county for many decades. We find it appalling that the introduction of zoning for such industry is being done in an area of the county that is historically underserved and lower-income. It is even more egregious because the worst effects including air pollution and groundwater contamination will be felt first and most severely in the immediate vicinity, and Ranson does not even have residents in the immediate vicinity of the proposed zoning change. This decision is being contemplated without the representation of

those who will be most affected. This would be a deplorable example of environmental injustice.

This zoning will provide for an industry that will harm our economy, drive away residents, challenge and or damage our infrastructure, and may damage our waterways and wildlife. Through these effects, the industry this zoning would allow will adversely affect the health, safety, and welfare of our community. This is being done without representation of those it will affect the most. Please vote No on Ordinance #2017-302.

Sincerely,
James P Leach

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I am an event rider that has my horse stabled in Harpers Ferry, WV. This plant will affect the health of my horse as well as many other horses in the area.

Please vote no on Ordinance #2017-302. Ranson's proposed zoning change presents a significant risk to the equine industry in Jefferson County and well beyond. The type of industry that would be allowed by the proposed zoning change in this location would jeopardize horse health, the groundwater supply, and workforce productivity. This will cause immediate shrinkage and threaten the long-term viability of the equine industry in the county. In doing so, the industry this zoning change will allow for will adversely affect the health, safety, and welfare of our community.

The site of the proposed rezoning is less than six miles from Charles Town Races, with several breeding, training, and rehabilitation facilities between the two. The industry allowed by this rezoning would produce particulate, gaseous, and hazardous air emissions that would reach these sites. According to the WVDEP air permit, the Rockwool plant in Ranson is permitted to emit 250.87 tons of particulate matter per year into the air (1).

According to a recent study published in the journal of Veterinary Internal Medicine (2), horses are 15 times more sensitive to inhaled particulate matter than humans. Inhaled particulate matter can cause inflammation in horses' lungs that negatively affects performance. Inhaled particulate matter also contributes to the development of inflammatory airway disease (IAD) (3). IAD is a chronic airway disease that can affect horses long after their racing career is over. While there is little research on how other air pollutants affect horses, the effects of pollution on humans can be used to infer potential impact on horses. However unlike human models, these horses are elite athletes continuously exposed, and will thus likely experience detrimental effects at much lower levels of air pollution than humans.

The primary concern with air pollution is that increased levels of pollutants will increase inflammation in horses' lungs. Even small, subclinical amounts of inflammation in the lungs of horses negatively affect performance (2,3,4,5,6,11). This inflammation can also cause increased recovery times following racing (7,11). Reduced performance and training interruptions can lead to higher risk of injury, reduced winning average, fewer yearly starts, lower yearly earnings, shortened career length, fewer lifetime starts, reduced lifetime earnings, and reduced quality of life (2,3,8,9,11). Each of these situations will lead to decreased return on investment, decreased cash flow, and decreased overall earnings for owners, trainers, and breeders with horses at Charles Town Races and in nearby areas. In this way, the industry this zoning will allow will adversely affect the welfare of our community.

While racing is usually a thoroughbred's first career, it is rarely their last. Some racing horses go on to be breeding stock, while others will have successful careers as sport horses. Jefferson County is an important source of new stock for sport horse trainers from Northern Virginia, and Maryland, and this is a resource for local horseman of both income and placement for horses not appropriate for breeding. However, if retired racehorses are unsound from injury or respiratory disease, they can be difficult to manage as breeding stock or unfit for a career as a sport horse. This affects the horse's quality of life and also places a burden on the industry locally and regionally. In this way, the industry this zoning will provide for will adversely affect the welfare of our community.

The perception of decreased air quality from the increase in regional haze and visible smokestacks as one drives into the county will deter out of state owners and breeders from investing in West Virginia bred Race horses, decreasing or eliminating a critical \$50 million a year source of local business volume. In this way, the industry this zoning will provide for will adversely affect the welfare of our community.

Another concern related to the proposed rezoning in Ranson is the risk of groundwater contamination as a result of the karst hydrogeology at the site and the industrial activity. Horsemen will either have to take on the expense of periodically testing water sources or they may not know local ground water is contaminated until their animals are sick. Veterinary care and testing adds expense and uncertainty to an industry that already deals with large inherent risks. The actual occurrence of ground water contamination would be devastating for Jefferson County's equine industry. For both geographic and financial reasons, it is simply impossible to think that the industry could solely use public or private utility-provided water if industrial activity fouled the local groundwater. In this way, the industry this zoning will provide for will adversely affect the health, safety, and welfare of our community.

Finally, studies on US agricultural workers have demonstrated that increased air pollution decreases productivity of outdoors workers. This would place an additional burden on workers, small business owners and the industry. In this way the industry this zoning will provide for will adversely affect the health, safety, and welfare of our community.

The equine industry in Jefferson County is hundreds of years old. It is not worth risking this historic and economically valuable industry by rezoning for industrial companies like Rockwool. An economic impact study of the Charles Town Thoroughbred Horse Racing Industry on Jefferson County's economy found that the spending by owners, breeders, and trainers of the equine industry directly contributes \$79.4 million to the county each year. Out-of-state owners, breeders, and trainers spend more than \$50 million in Jefferson County every year. The value of total business volume in Jefferson County is \$191 million each year (10). These numbers do not include the effect of the handle or the casino.

The equine industry provides jobs for a broad cross-section of the public. This industry offers individuals of any educational background a variety of paths to achieve a good middle-income living. Many jobs allow individuals to pursue apprenticeships or on-the-job training rather than requiring a costly college education. This flexibility allows for greater lifetime earnings and improved educational debt-to-earnings ratio for these workers. The equine industry also provides opportunities for non-traditional workers by offering job opportunities to those who may not be employable by larger corporations. This industry provides a variety of full-time, part-time, flexible, and pick-up work. Encouraging this type of flexible job ecosystem helps create a healthy economy with broad participation in employment and consumption.

The equine industry is a large conglomerate of small businesses, which have a multitude of economic benefits over having a few large businesses. It has been extensively reported that small locally owned businesses and start ups create more jobs, cultivate innovation, generate higher incomes, and provide more opportunities for individuals that would otherwise not exist than big non-local firms, which can actually depress local economies. The equine industry provides opportunities for small businesses and startups responsible for this growth of better jobs that are so good for the economy.

The equine industry offers so many other benefits that the industry in the rezoned area would not. For example, the equine industry supports local agriculture by providing a market for agricultural goods such as straw. The robust straw market supported by owners, trainers, and breeders allows for a third cash crop to be produced from one field in a year. Through pastureland and support of local agricultural goods, the equine industry protects and preserves the open spaces that give our county its bucolic quality and help attract tourists. Through the breeders' incentive programs, the equine industry offers unique opportunities to draft state funds back to Jefferson County, to name a few.

Rezoning this area of Ranson for Special District Industrial will allow in entities whose activities are harmful to the equine industry. The losses incurred by the equine industry would far outweigh any benefits derived from industries occupying the rezoned area. Sacrificing the long-term viability of one of our oldest and most productive industries for a net loss in business volume and economic value just does not make good sense for the local economy. This zoning change would provide for industry that would adversely affect the health, safety and welfare of our communities. Please vote NO on Ordinance #2017-302.

Sincerely,

Marcelle Venetsanos

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Madge Star
Shepherdstown, 25443

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote NO on Ordinance #2017-302. This rezoning will put an undue hardship on the wastewater treatment systems, burden the ratepayers and risk surface waterways in Charles Town, risking the health, safety, and welfare of the community. The comprehensive plan of Ranson states the City "will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community." Therefore, please vote NO on #2017-302.

The nature of the industry that this zoning will allow will be harmful to our local economy. Charles Town has spent a lot of time and money improving our downtown area for restaurants and retail. We are working to take advantage of the tourism industry in our county and bring more people into Charles Town. The eyesore, noise pollution, air pollution, and obvious move away from sustainability will drive people away from Jefferson County and Charles Town, rendering our efforts ineffective and unrewarding. This will make it harder for our small businesses to be successful. In this way, the industry this zoning will adversely affect the welfare of our community.

According to the 2018 WVU economic study of the eastern panhandle, over 40% of the workforce in Jefferson County choose to work outside of the state. These commuters bring that money home and spend it here supporting our local small businesses, economy, and government. Charles Town has many residents who commute. These typically higher earners may choose to leave the area because of the presence of the industry that this zoning change would provide. This will cause hardship for our economy and municipality. The industry this zoning will provide will adversely affect the welfare of our community.

The industry that this zoning will allow will cause stress for multiple reasons on the Charles Town wastewater treatment systems and the surface waterways in Jefferson County and beyond. The industry currently planning to utilize the zoning change will have discharged to the

wastewater system that is high in chloride, primarily from its water softening system. The NPDES permit modification allows up to 5,000 mg/L. Chloride is not settled or removed at the wastewater treatment plant. It cannot be removed by conventional means and would be prohibitively expensive to do by new technology. This is of concern to Charles Town because chloride can harm stream water and impair the functioning of the wastewater treatment plant. Furthermore, the corrosive nature of chloride can cause damage to pipes both in the wastewater system and those used by downstream drinking water systems, like the \$207 million Trap Rock Water Treatment plant in Loudoun.

The human health criteria for chloride under WV standards is 250 mg/L. Under low streamflow conditions, chloride additions to the treatment plant effluent, as proposed by the industry currently planning to utilize the zoning change, could cause chloride levels in Evitts Run to exceed this standard. If the amount of chloride increased due to expansion or higher throughput, then this human health standard would be violated frequently. Chlorides are also known to harm aquatic life and affect metal toxicity in rivers. The USEPA and several states have surface water guidelines of 230 mg/L for chronic exposure. This would also pose a risk of damaging the water treatment facilities downstream on the Potomac River.

A research study by Lefebvre and Moletta in 2006 showed that chloride and salinity impair the ability of wastewater treatment to remove phosphorus and nitrogen, and because of this, other states have introduced legislation to treat saline wastewater. Uygur and Kargi in 2004 looked at the effects of salt on synthetic wastewater treatment. They found that the removal of both nitrogen and phosphorus was reduced when salinity increased from 0 to 6%. In fact, the removal efficiency of ammonia dropped from 96% to 39% with this increasing salinity. Hong et al. in 2016 found phosphorous removal decreased 20-28% when chloride concentrations went from 150 mg/L to 1,500 mg/L. Phosphorous removal was completely inhibited at concentrations greater than 2,500 mg/L. This increased salinity has the potential to make the Charles Town wastewater treatment system work far less efficiently.

In addition to the contents of the wastewater this type of industry will produce, the volume of sewage is itself a concern. Given that the City of Charles Town has been in violation of its permit on numerous occasions for spills and overflow of untreated sewage, adding large volumes of wastewater will further challenge the near-capacity system. This will mean that costly capacity upgrades will need to be done likely sooner than they would have needed to be done, imposing further financial strain on the system. Through these effects, the industry this zoning will provide will adversely affect the health, safety, and welfare of the community.

This zoning change will provide for an industry the likes of which are not present in this county and have not been present in this county for many decades. We find it appalling that the introduction of zoning for such industry is being done in an area of the county that is historically underserved and lower income. It is even more egregious because the worst effects including air pollution and groundwater contamination will be felt first and most severely in the immediate vicinity, and Ranson does not even have residents in the immediate vicinity of the proposed zoning change. This decision is being contemplated without the representation of

those who will be most affected. This would be a deplorable example of environmental injustice.

This zoning will provide for an industry that will harm our economy, drive away residents, challenge and or damage our infrastructure, and may damage our waterways and wildlife. Through these effects, the industry this zoning would allow will adversely affect the health, safety, and welfare of our community. This is being done without representation of those it will affect the most. Please vote No on Ordinance #2017-302.

Sincerely,

Amber Leach

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would negatively affect tourism, economic agility, groundwater quality, and individual health in neighboring municipalities like Shepherdstown. In doing these things the industry that this zoning change provides for will adversely affect the health, safety, and welfare of our community.

Tourism is critically important to Shepherdstown's economy and to the county as a whole. In 2018, tourist spending in the Jefferson County contributed over \$170 million to state and local government revenue and \$213 million in individual earnings. Importantly, most of this money comes from tourists visiting from neighboring states like Virginia, Maryland, and Washington D.C. Out-of-state tourists are largely drawn to Jefferson County because of its reputation for environmental-friendly, sustainable industry. Key elements that support this reputation include the county's pastoral scenery and pristine natural resources. Ordinance #2017-302 will allow industry into Jefferson County that risks harming these elements and dramatically reducing the area's appeal to visitors. The resulting harm to our tourist industry would drive away visitors and decrease state, county, and local revenue. The long-term success of Jefferson County's tourism industry is dependent on local governments making coordinated zoning decisions. Allowing certain types in industry in Ranson will negatively affect tourism in every municipality throughout the county, including Shepherdstown. Voting no on ordinance #2017-302 will protect the foundations of the county's tourism industry and protect the 7,040 jobs in Jefferson County that are directly supported by tourism. In this way, the industry this zoning change will allow will adversely affect the welfare of our community.

The type of large, consolidated industry that ordinance #2017-302 would allow in Ranson would generally reduce the flexibility of local economies in Jefferson County. Historically, the driving industries in Jefferson County have been tourism, agriculture, and the equine industries. These three industries are large conglomerates of small businesses. Small business is very important

to Shepherdstown. Small businesses have been shown to create more jobs, cultivate more innovation, and provide more opportunities than big, non-local firms. Additionally, small businesses have been shown to be more reactive to sudden changes relative to manufacturing businesses. Bringing large, manufacturing-based industry into Jefferson county will depress the local economy and stifle innovation. During this time of economic upheaval and uncertainty, Jefferson County needs to support industries that will allow local economies to adapt and recover as fast as possible.

Voting no on ordinance #2017-302 will help protect water resources throughout Jefferson County. The type of industry that ordinance #2017-302 would allow puts the ground resources of Jefferson county at significant risk due to the karst hydrogeology. The site in Ranson is in the Rocky Marsh Run watershed, which is in the source water protection zone for Shepherdstown and drains to the Potomac River. Therefore, activity at this site will affect both groundwater and surface water streams. In municipalities like Shepherdstown, many residents and nearby farms depend on wells for water. Contamination of groundwater aquifers would create both health and remediation concerns for local residents. Dye tests performed by the USGS near the area of proposed rezoning in Ranson have shown just how far-reaching groundwater contamination at the Ranson site could be. Results from the USGS study revealed measurable dye concentrations in Elk's Run, Rattlesnake Run, and even the Shepherdstown Town Run. This last run cuts through the center of Shepherdstown and is a favorite area for children to play and learn to fish. In this way, the industry that this zoning change will allow will adversely affect the safety of our community.

Groundwater pollution is not the only concern for communities like Shepherdstown. The type of industry that ordinance #2017-302 would allow in Ranson would also generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. These pollutants are particularly harmful to children. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. The site in Ranson is across the road from an elementary school and also within the Jefferson High Middle district. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of children in Shepherdstown and all of Jefferson County. In this way, the industry that this zoning change will provide for will adversely affect the health of our community.

I again request that you vote no on ordinance #2017-302. This zoning change will allow industry that will adversely affect the health, safety, and welfare of our community. The long-term economic, environmental, and community health of municipalities like Shepherdstown depend on Ranson's participation in a coordinated zoning plan for all of Jefferson County.

Sincerely,

Elliot Kirschbaum

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would put at risk the health and well being of children of Jefferson County.

The type of industry that ordinance #2017-302 would allow in Ranson would generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. Exposure to these pollutants has devastating effects on children's health. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. Developing fetuses whose mothers are exposed to air pollution are more likely to have impaired organ development which can lead to early cognitive deficits, neurodevelopmental defects and other physical, cognitive, and psychological deficits later in life. An association between autism and prenatal exposure to particulate matter in air pollution has been demonstrated in several studies. Many studies have shown that lower test scores in math, English, and language arts are associated with exposure to outdoor air pollution. Industrial activity allowed by ordinance #2017-302 would also increase the risk of groundwater contamination in Ranson and nearby municipalities. Children whose families rely on well water, as is the case in much of Jefferson County, may be affected by polluted water. Voting no on ordinance #2017-302 will prevent air and water pollution from negatively affecting the long-term health of children in Jefferson County and surrounding areas.

The economic and environmental harm caused by the type of industry that ordinance #2017-302 would allow would put additional stress on the parents, caretakers, and teachers of children in affected areas. The weakening and destabilizing of this support network would have negative effects on local children. Many households in Jefferson County depend on the local agriculture, tourism, and equine industries for income. If industrial activity in Ranson depresses these industries, the resulting financial strain on these households will introduce additional stress and uncertainty into children's lives. Households living in areas affected by particulate

matter and regional haze will also suffer from the psychological effects of air pollution. Individuals living in areas with increase perception of pollution show increased levels of stress, anxiety, and unhappiness. School districts affected by increased air and water pollution may have trouble recruiting and retaining teachers. Teachers have a large influence on a child's daily life and, if educator quality and tenure decreases, the quality of this influence will diminish.

The site of the proposed rezoning in Ranson is across the road from an elementary school and proximal to lower-income neighborhoods. Observations like these demonstrate how ordinance #2017-302 would disproportionately affect vulnerable and historically-disadvantaged populations. The damaging health effects of air pollution have been shown to persist for at least three generations, so allowing certain types of industry in low-income areas would only compound existing disadvantages. Voting no on ordinance #2017-302 would be a step towards acknowledging that all individuals have the right to clean air and water.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." This zoning change would clearly adversely affect the health, safety, and welfare of the community. Children face increased exposure to air pollution adversely affecting their health, financial instability adversely affecting their welfare, groundwater contamination adversely affecting their safety, and environmental injustice and discrimination if ordinance #2017-302 is passed. Educators will face increased air pollution adversely affecting their health and consequently welfare. These adverse effects are all against Ranson's Comprehensive Plan. Please vote NO on Ordinance #2017-302.

Sincerely,

Gary Irving

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Stacey Spivey

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

SAVE OUR WATER SUPPLY!

I respectfully ask that you vote no on Ordinance #2017-302. While not in Ranson, the land and homes around the property that is the subject of the zoning change are closer to the property than anyone who currently lives within the city limits of Ranson. This area will be affected sooner and more harshly by the environmental issues that will develop secondary to the inappropriate siting of industry this zoning would allow.

The subject land has been well studied by Drs. Kozar, Doctor and Doctor and described in the scientific literature and USGS reports as having karst hydrology with very high aquifer vulnerability. The karst landscape is a consequence of the presence of soluble bedrock, which consists of limestone in the case of the subject land. In such landscapes water percolates through the ground and dissolves the underlying rock creating a porous network of caverns and throughways. Karst aquifers are known to be "extremely vulnerable to pollution" due to direct connection between the surface water and groundwater through both point (sinkholes) and diffuse (everywhere) infiltration. It is known from the Voluntary Remediation Plan of Jefferson Orchard that the groundwater at the subject site is only 60 feet below the ground. The subject property and much of the property around it are on an upland plain with few surface streams, but great seasonal variability in the water table resulting in numerous esteves and large amounts of water in the epikarst. This water is easily contaminated and this contamination spreads quickly throughout the aquifer. Dye tests performed near the subject site by the USGS have demonstrated this quick moving thorough dispersment in the aquifer in this area. While this contamination goes on to affect springs at the margins of the upland area continuing on in streams that service municipal water sources and the Potomac River, our concerns are far more immediate in both time and distance. Well water is the only water source available in the area of the proposed zoning change and, with the exception of Fox Glen, a majority of this water is supplied by private wells. Therefore, the groundwater aquifer fulfills a critical necessity,

fulfilling all needs including human consumption, household uses, and agriculture and maintenance of livestock and horses in the immediate area around the site. The concern is that if the aquifer becomes contaminated, then the local drinking water will be fouled.

For decades now, policy makers have been using “Aquifer Vulnerability,” to set land use and water resource protection policy. Karst has very high Aquifer Vulnerability. Therefore, this industrial use is not appropriate for this land and it should not be zoned for it. The guiding documents of the WVDEP recognize this. The introduction to the WVDEP document Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.”

The Chesapeake Bay Stormwater Network karst stormwater guidance document the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed, which the WVDEP cites in its own guiding document Stormwater Management Design in Karst Areas, clearly agrees stating:

“First, the effect of land development on karst terrain is complex and hard to predict, and requires professional analysis to reduce the risk of geological hazards, damage to infrastructure and groundwater contamination.” “The working group acknowledges that past approaches to stormwater and land development in karst terrain have been inadequate to safeguard the public and the environment.” “...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” We clearly need stronger comprehensive land use plans and zoning that direct new growth away from karst areas to more appropriate locations. Ordinance #2017-302 is literally the opposite of this.

Further, we cannot rely on the WVDEP to do the job that good local land use guidelines and zoning should do. For example, the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed states that detention and retention ponds are not recommended on karst and categorize them as discouraged. Also, quoting WVDEP’s own karst guidance: “attenuating surface runoff will increase the rate of sinkhole formation and potential groundwater contamination.” Yet the entity currently planning to utilize this zoning change is planning employment of multiple massive retention ponds and attenuating surface runoff completely. This has already been approved by the DEP in two Construction Stormwater General Permit registrations for that company. One of detention ponds is not even regulated by the DEP as it contains process water and has no outlet. Clearly the DEP recognizes the risks but is not appropriately limiting them. Relying on the DEP to protect the public health, safety, welfare, and the environment from any entity in these karst locations is simply as the CNS bulletin said it “inadequate to safeguard the public and the environment.” We must have appropriate zoning that takes into consideration appropriate use of land with karst

hydrogeology. Ordinance #2017-302 does not do this, but instead increases the risk to the public and the environment.

A second serious concern is the air emissions from the industry that this zoning will provide for. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. These types of air emissions have been shown to increase the risk of, contribute to, and exacerbate a multitude of developmental, physical, physiological, physiological, cognitive and economic. The exposure of one individual can cause repercussions in multiple generations. Embryos, fetuses, and children are most vulnerable with effects born out over a lifetime, and that of their offspring. Many of these effects only require short-term exposure and some have even been shown to occur at levels below current limits recommended by the World Health Organization. One example of this is that a recent study found that “Even within the limits set by the World Health Organization, the pollutants PM₁₀, SO₂, NO₂, and O₃ are associated with increased risk of treatment for respiratory diseases in children 0 to 6 years of age.” Unfortunately, the US limits are higher than WHO, 300 % higher in the case of PM₁₀!

In fact, in 2019, in the Advice from the Independent Particulate Matter Review Panel (formerly U.S. EPA Clean Air Scientific Advisory Committee Particulate Matter Review Panel) on EPA’s Policy Assessment for the Review of the National Ambient Air Quality Standards for Particulate Matter, it stated that the committee unanimously and unequivocally found that the current primary annual and 24-hour PM_{2.5} National Ambient Air Quality Standards (NAAQS) are not adequate to protect public health. The advice from this 20-member committee, whose scientific disciplines include epidemiology, medicine, toxicology, air quality measurement, air quality modeling, exposure assessment measurement and modeling, risk assessment, statistics, and others, was ignored due presumably to political pressure. Not only are the NAAQS too high in some cases, but due to the measure and mechanism by which they work, they can not replace the safety provided by good land use and zoning regulations, that are meant to do things like keep factories with air emissions and hundreds of heavy trucks away from elementary schools. In fact, there is a state law that prohibits siting a school near a factory. Unfortunately, the reciprocal law does not exist. Clearly, just like with the water resources, we cannot rely on the DEP or the EPA to do the job of what appropriate zoning should do. The whole point of zoning is to keep people safe and provide for their health and welfare. Ordinance #2017-302 puts families and school children directly in harms way.

The air emissions, threat to the groundwater, and the very presence of the industry that this zoning change will allow for will have a serious negative economic effect on those who live and or work closest to the site in question. Productivity and workforce participation will be negatively affected by the health effects of the air emissions. The local agricultural operations will be negatively affected by the air emissions with lower quantity and quality of crop yield and would be devastated if the ground water aquifer were fouled. The equine operations in the area, of which there are several, will be negatively affected by the air emissions as they affect the horses’ health and performance. The mere presence of the industry that will be provided

for by this zoning change will cause property values to fall. There will be serious economic consequences for the immediate area around the site in question.

Several of the communities in the immediate area of the site for proposed zoning change are traditionally underserved and have lower economic status. The choice of this location for such a zoning change represents an egregious example of environmental injustice that should not be promulgated or tolerated.

This zoning change will provide for industry that will negatively affect the health safety and welfare of our community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Respectfully, Ernest P Webb
Ranson, 25438

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

George Miller

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that will significantly harm the municipalities within Jefferson County and beyond affecting the health, welfare, and safety of our community. Harpers Ferry is a national treasure with the natural and historic resources tours flock to see each year and one of the communities that will be negatively impacted by this zoning change.

Jefferson County has many natural and historic treasures that will be destroyed or permanently damaged if increased industrial development is permitted to occur in the in the City and municipality of Ranson. Taking an area that was designated as an "historic orchard area" and that was originally zoned for primarily residential development, to include expanded public transit development, and changing the zoning (without full transparency and without providing ample notice and time for public review and comment) to allow industrial development is detrimental to the community, the environment, and the County. Industrial development, like the kind that Rockwool brings, will change and pollute the water and air in our County and in areas outside of Jefferson County. Allowing industrial development in an area that was supposed to be residential, not only brings air, water, and noise pollution, but nature's creatures will lose habitable environment, and with affordable housing already in short supply, the community will lose the much-needed opportunity for increased affordable housing development in the County. Jefferson County residents (of the human and animal varieties) will lose unless there is "NO" Vote on ordinance #2017-302. I urge you to Vote NO on ordinance #2017-302.

According to a 2019 study by the West Virginia Tourism Office, Jefferson County generated an average of \$178 million per year in tourism-derived revenue for state and local governments over the last 10 years, more than any other county in West Virginia by at least double. Tourism benefits the businesses and economy of Ranson and Jefferson County producing \$213.7 million in individual earning, 7040 jobs, and \$842.6 million in direct spending here in 2018. We would

need 40 Project Shuttles to replace the individual earnings and 59 Rockwools to replace the jobs provided by the tourism industry in Jefferson County. It is important to note that most of the money generated by tourism in Jefferson County comes from neighboring states. In this way, it is like an export: not simply recycling money, but bringing money into the state increasing its wealth. Much of the economy in Harpers Ferry is based on this tourism industry. A threat to this industry poses a threat to the economy and welfare of our community.

One of the important drivers for tourism in Harpers Ferry is the Appalachian Trail. According to the Appalachian Trail Conservancy (ATC), Harpers Ferry is the psychologic midpoint of the Trail, and hikers often plan extended stays in Jefferson County with an obvious positive impact. The ATC reports that the smokestacks and associated lights will be visible in the viewshed of 15 vistas on the Appalachian Trail (AT). Studies have shown that quality of vistas and human impact on the environment are not only noticed by visitors, but effect their experience. Another study published in the Journal of Applied Recreation Research, found that points of interests and views drew visitors' attention and had a significant impact on their perception of the trail. It was also found that particularly beautiful vistas helped visitors overlook elements that usually have a negative effect on trail experience like increased trail traffic. A 2009 study in Leisure Sciences revealed that scenic value was a perceptual theme of Appalachian Trail visitors, and that things as simple as dead trees visible in a vista can have a negative impact on visitors' overall perception. Imagine the effect the smokestacks will have from the 15 vistas from which they will be visible. The introduction of industrial activity made possible by the proposed rezoning in Ranson would have a negative effect on the scenic views of beautiful landscapes from the Appalachian Trail in Jefferson County.

The smokestacks are not all visitors will be able to see — the air pollution will create haze. The effect of regional haze on tourists was explored in a review article published in the Atmospheric Environment titled "Impaired visibility: the air pollution people see." A key takeaway on the negative affect of haze on vacationing tourists was summarized as follows:

"Vacations offer an escape from the routine and stress of our daily lives. Vacation destinations are often chosen based on their scenery; vacations are spent gazing at monuments, mountains, clouds, and oceans. Good visibility allows clear observation of distant features and appreciation of the inherent beauty of these scenes...Air pollution, which is often present in both our cities and parks, interferes with these attributes and can ruin the views vacationers travel to enjoy."

People seek bucolic, unspoiled areas to escape the stresses of urban areas. A 2004 study in Environment and Behavior found perceived pollution causes stress while viewing natural scenes has both psychological and physiological benefits, and a 2007 study confirmed these benefits. Two other studies found that people are emotionally affected by poor visibility, and tourists are disappointed when views are obscured by haze.

The combination of smokestacks and haze will mar the viewshed and will not only reduce the positive effects of a scenic landscape but also leave tourists disappointed and dissatisfied with

their choice of destination. With these effects the welfare of the Harpers Ferry community would undoubtedly be endangered by the industry that this zoning change will provide for.

Multiple studies by doctors Kozar, Doctor, and Doctor have demonstrated that the land at this site to be rezoned is Karst with the highest likelihood of sinkhole development in the county, and that the groundwater aquifer there is incredibly sensitive to contamination from surface water. Further, this site is on an upland plain with relatively few surface streams, seasonal variability in the water table that results in numerous estavelles, and large amounts of water in the epikarst. In this area contamination in surface water communicates easily to the water in the epikarst via diffuse and point infiltration, and the springs at the margins of the upland area are directly affected by the water quality throughout the aquifer. According to Jefferson Orchards Voluntary Remediation Plan with the WVDEP, the groundwater at the site is approximately 60 feet below the ground, and the tests performed by the USGS have shown that groundwater from just adjacent to this site emerged in the headwaters of both the Elk's Run and Rattlesnake Run. This is critically important for Harpers Ferry because the Elk's Run headwaters is a spring about three miles southeast of the site and goes on to become the drinking water source for Harpers Ferry and Bolivar before emptying into the Potomac River. The headwaters of Rattlesnake Run is a spring about 3.5 miles from the site and is also a tributary of the Potomac River. The Potomac River is the back up water source for Harpers Ferry. This means that the activity at the site will have a critical influence on the drinking water of Harpers Ferry. In this was the industry permitted by this change in zoning would undoubtedly endanger the health and safety of the community in Harpers Ferry.

The untoward health effects and individual economic consequences from the pollution emissions of the industry this rezoning will allow that will be born out over the length of people's lives and that of their decedents for at least three generations is an egregious example of environmental injustice that should not be tolerated. This zoning change may be in one of the poorest sections of the county, but the effects will be felt in every part of Ranson and the county.

The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." The industry that this rezoning will allow will jeopardize the health, safety and welfare of Ranson, Harpers Ferry and the whole county. Please vote no on the ordinance #2017-302.

Sincerely,

Beth Rosenberg

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would have a negative effect on water and air quality in neighboring states such as Maryland.

The Potomac River provides drinking water and a source of recreation to Maryland residents. Water and air pollution generated within the Potomac River's watershed will inevitably contaminate this valuable waterway. The site of the proposed zoning change in Ranson is located within the Potomac River Watershed.

The type of industry that ordinance #2017-302 would allow in Ranson would utilize large water impoundments, in an area of known karst terrain. This water will be contaminant from several sources including particulate mater that has fallen out from the air emissions and process water. The West Virginia Department of Environmental Protection has published guidelines that specifically discourage extensive development in areas of karst terrain because of the vulnerability of karst aquifers to contamination by surface pollution. Karst features increase surface water and groundwater connectivity and any spills or surface releases quickly percolate into the groundwater. Additionally, sinkholes are common in karst terrain and can cause ruptures in wastewater impoundments. Even if appropriate attempts are made to contain and manage wastewater and other stormwater runoff on-site, there is still a high risk that wastewater could contaminate the groundwater through tears and catastrophic failure of wastewater impoundments. Contaminated groundwater in karst terrain can easily resurface in waterways several miles away, as shown by a USGS tracer study conducted near the site in to be rezoned. The USGS study detected tracer dye in multiple springs and waterways miles from the initial injection site in Ranson. All of these waterways drain into the Potomac River.

Mismanagement of wastewater could also lead to contamination of nearby surface waters. For example, the site of the proposed rezoning in Ranson is in the Rocky Marsh Run watershed.

Rocky Marsh Run also drains to the Potomac River. Voting no on ordinance #2017-302 will preserve downstream water quality and help ensure that the Potomac River remains usable for Maryland residents.

Air pollution poses another risk to Maryland residents. The type of industry that ordinance #2017-302 would allow would generate air pollutants like fine particulate matter. According to the US EPA, fine particulates can travel 100s of miles from its original source. Air pollution related to industrial activity in Ranson could easily reach Maryland. Fine particulates have a greater affinity for carrying toxic compounds and their small size allows them to be inhaled more deeply into the lungs. Chronic exposure to fine particulate matter is associated with increased risk of several diseases including Alzheimer's in adults. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease among others. Fine particulate matter also exacerbates regional haze which creates a visible reminder of air pollution. The psychological effects that arise from an increased perception of pollution include stress, anxiety, and unhappiness. Voting no on ordinance #2017-302 will help prevent increased air pollution from negatively affecting the long-term health of Maryland residents.

The industry that this zoning will provide for will threaten the health, safety, and welfare of the residents in Maryland, and this land is not well-suited for industrial use. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." To achieve this, the council must not approve this proposed zoning change.

I again request that you vote no on ordinance #2017-302. Zoning decisions in Ranson and Jefferson County have an undeniable influence on the quality of life in neighboring states.

Sincerely,

Charene Snyder

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the Comprehensive Plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The heavy industry that this rezoning will provide for is in no way aligned with the original plan for Jefferson Orchard: "Jefferson Orchard, a proposed relocation of the Duffields MARC station and development of a transit oriented development in an intended growth urban area. This area is also proposed for an Industrial Special Industrial District that would utilize rail access." The presence of the heavy industry this zoning change will allow will have a substantial negative economic impact, and will undeniably endanger the welfare of the community. Instead of this rezoning, the City and County should continue with the intent of industry opportunities provided for in the Comprehensive Plan, which are not characterized as heavy industry, and lead the way with community-minded development looking toward the future.

The Comprehensive Plan states, "the City will designate ample land that is well-suited for industrial facilities." It does not refer to heavy industry, which is wholly incompatible not only with the karst hydrogeography of the land, but also with "a transit oriented development in an intended growth urban area" from which MARC commuters set off for work.

In recent months it has become even more clear that communities rich in history and natural beauty, like Jefferson County, are viable and sought after locations for businesses and industries looking for a higher quality of life. We are unique in our location and proximity, in our beauty, in our people and communities. That is our strength. Let's not spoil that by forever changing the nature of this community with heavy industry.

The Comprehensive Plan is clear: the City has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would adversely affect the health, safety, and welfare of the community.

The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for heavy industrial use and should not be zoned for it.

This rezoning stands counter to the Comprehensive Plan, and accordingly, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Amy DuBrueler

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I live and work in Jefferson County. I love my home. I have worked hard to expose and oppose the actions that were taken to allow Rockwool to move to the County. It is a corporation that doesn't belong here. The actions taken by Ranson in 2017 and 2018 were neither transparent nor consistent with the Ranson comprehensive plan and the zoning restrictions that were already adopted. If we have to live with Rockwool -- please do not approve the retroactive changes that could allow other industries to also come here.

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would negatively affect tourism, economic agility, groundwater quality, and individual health in neighboring municipalities like Shepherdstown. In doing these things the industry that this zoning change provides for will adversely affect the health, safety, and welfare of our community.

Tourism is critically important to Shepherdstown's economy and to the county as a whole. In 2018, tourist spending in the Jefferson County contributed over \$170 million to state and local government revenue and \$213 million in individual earnings. Importantly, most of this money comes from tourists visiting from neighboring states like Virginia, Maryland, and Washington D.C. Out-of-state tourists are largely drawn to Jefferson County because of its reputation for environmental-friendly, sustainable industry. Key elements that support this reputation include the county's pastoral scenery and pristine natural resources. Ordinance #2017-302 will allow industry into Jefferson County that risks harming these elements and dramatically reducing the area's appeal to visitors. The resulting harm to our tourist industry would drive away visitors and decrease state, county, and local revenue. The long-term success of Jefferson County's tourism industry is dependent on local governments making coordinated zoning decisions. Allowing certain types in industry in Ranson will negatively affect tourism in every municipality throughout the county, including Shepherdstown. Voting no on ordinance #2017-302 will protect the foundations of the county's tourism industry and protect the 7,040 jobs in Jefferson

County that are directly supported by tourism. In this way the industry this zoning change will allow will adversely affect the welfare of our community.

The type of large, consolidated industry that ordinance #2017-302 would allow in Ranson would generally reduce the flexibility of local economies in Jefferson County. Historically, the driving industries in Jefferson County have been tourism, agriculture, and the equine industries. These three industries are large conglomerates of small businesses. Small business is very important to Shepherdstown. Small businesses have been shown to create more jobs, cultivate more innovation, and provide more opportunities than big, non-local firms. Additionally, small businesses have been shown to be more reactive to sudden changes relative to manufacturing businesses. Bringing large, manufacturing-based industry into Jefferson county will depress the local economy and stifle innovation. During this time of economic upheaval and uncertainty, Jefferson County needs to support industries that will allow local economies to adapt and recover as fast as possible.

Voting no on ordinance #2017-302 will help protect water resources throughout Jefferson County. The type of industry that ordinance #2017-302 would allow puts the ground resources of Jefferson county at significant risk due to the karst hydrogeology. The site in Ranson is in the Rocky Marsh Run watershed, which is in the source water protection zone for Shepherdstown and drains to the Potomac River. Therefore, activity at this site will affect both groundwater and surface water streams. In municipalities like Shepherdstown, many residents and nearby farms depend on wells for water. Contamination of groundwater aquifers would create both health and remediation concerns for local residents. Dye tests performed by the USGS near the area of proposed rezoning in Ranson have shown just how far-reaching groundwater contamination at the Ranson site could be. Results from the USGS study revealed measurable dye concentrations in Elk's Run, Rattlesnake Run, and even the Shepherdstown Town Run. This last run cuts through the center of Shepherdstown and is a favorite area for children to play and learn to fish. In this way, the industry that this zoning change will allow will adversely affect the safety of our community.

Groundwater pollution is not the only concern for communities like Shepherdstown. The type of industry that ordinance #2017-302 would allow in Ranson would also generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. These pollutants are particularly harmful to children. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. The site in Ranson is across the road from an elementary school and also within the Jefferson High Middle district. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of children in Shepherdstown and all of Jefferson County. In this way, the industry that this zoning change will provide for will adversely affect the health of our community.

I again request that you vote no on ordinance #2017-302. This zoning change will allow industry that will adversely affect the health, safety, and welfare of our community. The long-term economic, environmental, and community health of municipalities like Shepherdstown depend on Ranson's participation in a coordinated zoning plan for all of Jefferson County.

Sincerely,

Billie Garde
Shepherdstown, 25443

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask you to vote NO on Ordinance #2017-302. The industry this zoning change will allow for endangers the health, safety and, welfare of the community, and violates the premise of the smart code zoning that we have spent so much time, effort and federal money employing.

This zoning change will provide for industry that will negatively affect the agriculture industry in Jefferson County and beyond. The combination of the air emissions and threat to the ground water resources could have devastating consequences for the agricultural community of Jefferson County.

The comprehensive plan of Ranson is clear: it states, "the City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community." This land is ill-suited for an industrial facility due to its location and hydrogeology. Further, the industry that this zoning change will allow for will adversely affect the health, safety, and welfare of the community through its affect on the agricultural industry.

The agriculture industry in Jefferson County is hundreds of years old and continues to serve our community well today. According to the economic impact study "A Shared Agenda for Growing West Virginia's Agricultural Economy, Prepared by Fourth Economy for West Virginia Department Of Agriculture West Virginia University Extension Service 2012," Jefferson County is the second highest producing county for crops sales, third highest for fruits and vegetables sales, and in the top 9 counties for sales of animals and animal products.

Agriculture, tourism and the equine industries work synergistically to have an outsized positive impact on the economy in Ranson and Jefferson County as a whole. Agriculture drives tourism by creating agro-tourism opportunities, preserving beautiful open spaces that contribute to the

bucolic nature of our county, and providing the locally produced agriculture goods many tourists are look for in our markets and restaurants. Agriculture also supports the equine industry by providing local products like hay and straw, helping maintain pasture land, co-supporting local dual-purpose retail stores, and helping recycle by products. Agriculture helps maintain the way of life that many those who choose to live in Jefferson County enjoy. Industrial manufacturing and industry this zoning will provide for could never achieve these things.

Local agriculture also provides a source of locally produced agricultural goods. It has become apparent with the current pandemic and health emergency. This became a supply chain crisis because as our supply chains have moved to be ever more lean and efficient they lack resiliency and agility. By having a local source of agricultural goods and food we add resiliency and agility into our own economy and community. The agricultural industry in Jefferson County provides this.

A plethora of scientific studies have shown that a variety of air pollutants produced by the type of industry this zoning change would provide for causes decreased yields of both quantity and quality for several of the crops important to Jefferson County including winter wheat and soybeans. Soybeans and wheat are two of the crops significantly affected and two of the most prevalent crops in Jefferson County. Lower crop yields harm the farms and all the members of the down stream supply chain as well as the consumer. In this way, this zoning change will adversely affect the welfare of the community.

Recent studies have shown that even small increases in air pollution affect the productivity of agricultural workers. Similar to the reduction in crop yield this will negatively affect the individual workers, businesses, consumers and industry as a whole. In this way, this zoning change will adversely affect the health and welfare of individuals and the community.

Even more devastating is the possibility of groundwater contamination. The land at the subject location has karst hydrogeology and as such has porous bedrock and severe ground instability problems. The porous bedrock allows rapid diffuse infiltration of surface water into ground water and the severe ground instability problems leads to sinkhole development. Sinkholes provide direct connection of the surface water with the ground water aquifer through point infiltration. In fact, according to a 2012 study by Doctor and Doctor, the subject location and that of Terrapins Neck have the highest sinkhole vulnerability of any sites in Jefferson County. The propensity and easy of diffuse and point infiltration in areas of karst hydrogeology give them very high aquifer vulnerability meaning the aquifer is very vulnerable to contamination. For this reason, this measure has been used for decades by policymakers to set land use regulations. In this way, this zoning change and the industry it will provide for will adversely affect the welfare of the community.

The WVDEP recognizes development in car karst areas puts water resources high-risk for contamination but also recognizes that this is best protected against true local land use and zoning ordinances. WVDEP's guiding document Stormwater Management Design in Karst Areas

states, "it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." This document also references the Chesapeake Bay Stormwater Network karst stormwater guidance document the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed. In which it states "...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." Land use policy in Ranson and zoning need to take aquifer vulnerability into consideration as these agencies and documents suggest.

The Jefferson Orchards Voluntary Remediation Plan application reports that the ground water is only 60 feet from the surface at the site. It is described in the scientific literature that this land is an upland plane with large amounts of water in the epikarst, and contamination of this water effects the whole aquifer including the communications with surface water streams. A USGS study demonstrated that the groundwater adjacent to the site communicates readily with several surface water structures and wells miles away from the site. The effects of contamination at this site would go well beyond Ranson fouling large portions of the ground water and surface water in Jefferson County.

Groundwater contamination at the site would have devastating effects on the Agricultural industry in Jefferson county. For geographic and economic reasons it is simply infeasible for the agricultural industry to rely on utility provided water. Based on the scientific literature the site being considered for rezoning is one of the areas of highest aquifer vulnerability in Jefferson County and is inappropriate for the industry that this zoning change will provide for. This land is clearly ill-suited for industrial use and should not be zoned for it.

By threatening the local agricultural industry, the industry that this zoning will provide for will threaten the health, safety, and welfare of the community, and this land is not well-suited for industrial use. The Comprehensive Plan in Ranson is clear the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Amanda Adkins

Former Shepherdstown resident, mother of children in Jefferson co schools and community member concerned about negative effects on food/ wine/ air quality and therefore, quality of life and our right to health.

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

ruth tyson

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask you to vote NO on Ordinance #2017-302. The industry this zoning change will allow for endangers the health, safety and, welfare of the community, and violates the premise of the smart code zoning that we have spent so much time, effort and federal money employing.

Any change in zoning needs to align with the comprehensive plan. In Ranson's current comprehensive plan (2012), the city only refers to "heavy industry" in the history section. Here it is characterized as part of a bygone era that has been replaced by an emphasis on agriculture for local food production, open spaces, and quality-of-life. In the remainder of the document, the word industry is used loosely to describe businesses including flower shops and shoe stores. Nothing that resembles the industry that this zoning change will provide for is described in the current comprehensive plan of Ranson.

In the land use section of the comprehensive plan, number ten states:

"Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The comprehensive plan clearly states that the city will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community. This change in zoning clearly negatively affects the health, safety, and welfare of the community.

As the zoning is proposed, the industry that this zoning change will allow for will be directly across the street from houses, parks and other small businesses. A densely populated subdivision and an elementary school already exit directly across the street. While these latter

community sections are not in the city limits, the effect of this zoning on them should still be considered just the same as it would be if they were in the city limits.

The industry that this zoning change will provide for will produce particulate, gaseous, and hazardous air emissions. These emissions have been shown to be detrimental to human health at every stage of life from embryo to old age. In utero and childhood exposure are the most damaging with lasting effects being realized through out life, and with maternal exposure the effects can be felt for generations. Multiple organ systems are affected including respiratory, cardiovascular, neurologic, immune, and endocrine causing defects in multiple processes including in utero development, neurodevelopment, immune and tolerance development, and cognitive defects. There are also psychological, social, and economic effects from both perceived and actual air pollution in both children and adults. Many of these effects can be seen even with short-term exposure or exposure that is lower than the levels recommended by the US Environmental Protection Agency and World Health Organization. These consequences are devastating to the individual and depressing to the local community and economy. State law does not allow a school to be built next to industry that this zoning will allow but yet we are contemplating changing the zoning so this industry can build next to a school. This does not make sense. As Ranson residents, we want Ranson to follow the lead of the state and keep polluting industry away from kids. In these ways, this change in zoning will negatively affect the health and welfare of the community.

In addition to the health effects of the air emissions is the threat to groundwater from the industry that this zoning change would allow. The land in question has karst hydrogeology and therefore very high aquifer vulnerability and is not appropriate for this industry. With the type of industry this zoning will provide for, combined with high aquifer vulnerability, the likelihood of groundwater contamination is too high for the community and region to bear. A USGS study demonstrated that contamination in the groundwater adjacent to the site moves relatively quickly and can be found in wells and surface water structures in a variety of locations in the County. In this way, contamination at the site would affect the drinking water of the great majority of Jefferson County residents. Through the surface water connections, the water at the site also affects the water resources of the region.

Aquifer vulnerability has been used by policy makers for decades to set land use regulations. The guiding document, from the WVDEP, Stormwater Management Design in Karst Areas states, "it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." In Ranson, we need to follow this advice and not change the zoning of this land for use by industry that has among the highest aquifer vulnerability in the County. This zoning change will endanger the safety of the community and region by endangering the safe water resources. As Ranson residents, we want to safeguard the water resources of the county and region by following the WVDEP guidance here.

Further, by reallocating this transect district and replacing it with a monolithic block of Special District Industrial designation, hundreds of housing units, parks and space for small businesses are lost. Ranson loses the potential for property tax on these properties and their improvements, Business and Occupational tax on the businesses and sales tax in retail stores. The community loses out on the opportunity to develop affordable housing and create locations where people can live, work, play, and shop all in the same place reducing the need for travel.

Worse yet apparently a deal has been made where the entity that owns the subject land has required that a litany of things not be built on the adjacent land essentially stripping the purpose of the smart code transect zone that exists there. Transect zones in the smart code are meant to transition, from out to in, and provide communities where people can safely work and live in close proximity in an effort to reduce travel. Excluding many of the components of the transect zone effectively eliminates the features that make it a transect zone, thus, losing the benefits a transect zone offers the community and city. By losing these benefits, reducing the overall and affordable housing prospects, and reducing so drastically the opportunities for city income, this zoning change will negatively affect the welfare of the community.

As Ranson residents, we find it odd that we are changing zoning to provide for industry that we would not put in the middle of our town close to our residents, but we are placing it close to the homes of county residents. Further, it is striking that the area where this change in zoning is directly adjacent to historically underserved lower income communities and a Title I school. This amounts to environmental injustice and cannot be tolerated.

The purpose of zoning is for a city to protect the health, welfare, morals and safety of the community. In this case, the air emissions and heavy truck traffic will endanger the communities' health. The threat of water contamination will endanger the safety of the community. The effect of lost productivity and decreased workforce participation due to increased illness and the negative effect the air emissions and presence of such a factory will have on the local economy will negatively affect the welfare of the community. The environmental injustice of changing the zoning to accommodate such polluting industry in a location where your municipality has no residents, but yet hundreds of low income and underserved county residents live is egregiously amoral. This must not happen. We respectfully implore you to do the right thing and vote no on ordinance #2017-302.

Sincerely,

Sara McCann

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Natalie Patton

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote NO on Ordinance #2017-302. This rezoning will put an undue hardship on the wastewater treatment systems, burden the rate payers and risk surface waterways in Charles Town, risking the health, safety and welfare of the community. The comprehensive plan of Ranson states, the City "will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community." Therefore, please vote NO on #2017-302.

The nature of the industry that this zoning will allow will be harmful to our local economy. Charles Town has spent a lot of time and money improving our downtown area for restaurants and retail. We are working to take advantage of the tourism industry in our county and bring more people into Charles Town. The eye sore, noise pollution, air pollution, and obvious move away from sustainability will drive people away from Jefferson County and Charles Town, rendering our efforts ineffective and unrewarding. This will make it harder for our small businesses to be successful. In this way, the industry this zoning will provide for will adversely affect the welfare of our community.

According to the 2018 WVU economic study of the eastern panhandle, over 40% of the workforce in Jefferson County choose to work outside of the state. These commuters bring that money home and spend it here supporting our local small businesses, economy and government. Charles Town has a large number of residents who commute. These typically higher earners may choose to leave the area because of the presence of the industry that this zoning change would provide for. This will cause a hardship on our economy and municipality. In this way, the industry this zoning will provide for will adversely affect the welfare of our community.

The industry that this zoning will allow will cause stress for multiple reasons on the Charles Town wastewater treatment systems and the surface waterways in Jefferson County and

beyond. The industry currently planning to utilize the zoning change will have discharge to the wastewater system that is high in chloride, primarily from its water softening system. The NPDES permit modification allows up to 5,000 mg/L. Chloride is not settled or removed at the wastewater treatment plant. It cannot be removed by conventional means and would be prohibitively expensive to do by new technology. This is of concern to Charles Town because chloride can harm stream water and also impair functioning of the wastewater treatment plant. Furthermore, the corrosive nature of chloride can cause damage to pipes both in the wastewater system and those used by downstream drinking water systems, like the \$207 million Trap Rock Water Treatment plant in Loudoun.

The human health criteria for chloride under WV standards is 250 mg/L. Under low stream flow conditions, chloride additions to the treatment plant effluent, as proposed by the industry currently planning to utilize the zoning change, could cause chloride levels in Evitts Run to exceed this standard. If the amount of chloride increased due to expansion or higher throughput, then this human health standard would be violated frequently. Chlorides are also known to harm aquatic life and effect metal toxicity in rivers. The USEPA and several states have surface water guidelines of 230mg/L for chronic exposure. This would also pose a risk of damaging the water treatment facilities downstream on the Potomac River.

A research study by Lefebvre and Moletta in 2006 showed that chloride and salinity impair the ability of wastewater treatment to remove phosphorus and nitrogen, and because of this, other states have introduced legislation to treat saline wastewater. Uygur and Kargi in 2004 looked at the effects of salt on synthetic wastewater treatment. They found that removal of both nitrogen and phosphorus was reduced when salinity increased from 0 to 6%. In fact, the removal efficiency of ammonia dropped from 96% to 39% with this increasing salinity. Hong et al. In 2016 found phosphorous removal decreased 20-28% when chloride concentrations went from 150 mg/L to 1,500 mg/L. Phosphorous removal was completely inhibited at concentrations greater than 2,500 mg/L. This increased salinity has the potential to make the Charles Town wastewater treatment system work far less efficiently.

In addition to the contents of the wastewater this type of industry will produce, the volume of sewage is itself a concern. Given that the City of Charles Town has been in violation of its permit on numerous occasions for spills and overflow of untreated sewage, adding large volumes of wastewater will further challenge the near capacity system. This will mean that costly capacity upgrades will need to be done likely sooner than they would have needed to be done, imposing further financial strain on the system. Through these effects, the industry this zoning will provide for will adversely effect the health, safety, and welfare of the community.

This zoning change will provide for industry the likes of which are not present in this county and have not been present in this county for many decades. We find it appalling that the introduction of zoning for such industry is being done in an area of the county that is historically underserved and lower income. It is even more egregious because the worst effects including air pollution and groundwater contamination will be felt first and most severely in the immediate vicinity, and Ranson does not even have residents in the immediate vicinity of the

proposed zoning change. This decision is being contemplated without representation of those who will be most affected. This would be a deplorable example of environmental injustice.

This zoning will provide for industry that will harm our economy, drive away residents, challenge and or damage our infrastructure, and may damage our waterways and wild life. Through these effects, the industry this zoning would allow will adversely effect the health, safety, and welfare of our community. This is being done with out representation of those it will affect the most. Please vote No on Ordinance #2017-302.

Sincerely,

Andrew Kemp

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask you to vote NO on Ordinance #2017-302. The industry this zoning change will allow for endangers the health, safety and, welfare of the community, and violates the premise of the smart code zoning that we have spent so much time, effort and federal money employing.

This zoning change will provide for industry that will negatively affect the agriculture industry in Jefferson County and beyond. The combination of the air emissions and threat to the ground water resources could have devastating consequences for the agricultural community of Jefferson County.

The comprehensive plan of Ranson is clear: it states, "the City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community." This land is ill-suited for an industrial facility due to its location and hydrogeology. Further, the industry that this zoning change will allow for will adversely affect the health, safety, and welfare of the community through its affect on the agricultural industry.

The agriculture industry in Jefferson County is hundreds of years old and continues to serve our community well today. According to the economic impact study "A Shared Agenda for Growing West Virginia's Agricultural Economy, Prepared by Fourth Economy for West Virginia Department Of Agriculture West Virginia University Extension Service 2012," Jefferson County is the second highest producing county for crops sales, third highest for fruits and vegetables sales, and in the top 9 counties for sales of animals and animal products.

Agriculture, tourism and the equine industries work synergistically to have an outsized positive impact on the economy in Ranson and Jefferson County as a whole. Agriculture drives tourism by creating agro-tourism opportunities, preserving beautiful open spaces that contribute to the

bucolic nature of our county, and providing the locally produced agriculture goods many tourists are look for in our markets and restaurants. Agriculture also supports the equine industry by providing local products like hay and straw, helping maintain pasture land, co-supporting local dual-purpose retail stores, and helping recycle by products. Agriculture helps maintain the way of life that many those who choose to live in Jefferson County enjoy. Industrial manufacturing and industry this zoning will provide for could never achieve these things.

Local agriculture also provides a source of locally produced agricultural goods. It has become apparent with the current pandemic and health emergency. This became a supply chain crisis because as our supply chains have moved to be ever more lean and efficient they lack resiliency and agility. By having a local source of agricultural goods and food we add resiliency and agility into our own economy and community. The agricultural industry in Jefferson County provides this.

A plethora of scientific studies have shown that a variety of air pollutants produced by the type of industry this zoning change would provide for causes decreased yields of both quantity and quality for several of the crops important to Jefferson County including winter wheat and soybeans. Soybeans and wheat are two of the crops significantly affected and two of the most prevalent crops in Jefferson County. Lower crop yields harm the farms and all the members of the down stream supply chain as well as the consumer. In this way, this zoning change will adversely affect the welfare of the community.

Recent studies have shown that even small increases in air pollution affect the productivity of agricultural workers. Similar to the reduction in crop yield this will negatively affect the individual workers, businesses, consumers and industry as a whole. In this way, this zoning change will adversely affect the health and welfare of individuals and the community.

Even more devastating is the possibility of groundwater contamination. The land at the subject location has karst hydrogeology and as such has porous bedrock and severe ground instability problems. The porous bedrock allows rapid diffuse infiltration of surface water into ground water and the severe ground instability problems leads to sinkhole development. Sinkholes provide direct connection of the surface water with the ground water aquifer through point infiltration. In fact, according to a 2012 study by Doctor and Doctor, the subject location and that of Terrapins Neck have the highest sinkhole vulnerability of any sites in Jefferson County. The propensity and easy of diffuse and point infiltration in areas of karst hydrogeology give them very high aquifer vulnerability meaning the aquifer is very vulnerable to contamination. For this reason, this measure has been used for decades by policymakers to set land use regulations. In this way, this zoning change and the industry it will provide for will adversely affect the welfare of the community.

The WVDEP recognizes development in car karst areas puts water resources high-risk for contamination but also recognizes that this is best protected against true local land use and zoning ordinances. WVDEP's guiding document Stormwater Management Design in Karst Areas

states, "it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." This document also references the Chesapeake Bay Stormwater Network karst stormwater guidance document the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed. In which it states "...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." Land use policy in Ranson and zoning need to take aquifer vulnerability into consideration as these agencies and documents suggest.

The Jefferson Orchards Voluntary Remediation Plan application reports that the ground water is only 60 feet from the surface at the site. It is described in the scientific literature that this land is an upland plane with large amounts of water in the epikarst, and contamination of this water effects the whole aquifer including the communications with surface water streams. A USGS study demonstrated that the groundwater adjacent to the site communicates readily with several surface water structures and wells miles away from the site. The effects of contamination at this site would go well beyond Ranson fouling large portions of the ground water and surface water in Jefferson County.

Groundwater contamination at the site would have devastating effects on the Agricultural industry in Jefferson county. For geographic and economic reasons it is simply infeasible for the agricultural industry to rely on utility provided water. Based on the scientific literature the site being considered for rezoning is one of the areas of highest aquifer vulnerability in Jefferson County and is inappropriate for the industry that this zoning change will provide for. This land is clearly ill-suited for industrial use and should not be zoned for it.

By threatening the local agricultural industry, the industry that this zoning will provide for will threaten the health, safety, and welfare of the community, and this land is not well-suited for industrial use. The Comprehensive Plan in Ranson is clear the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

This issue has deeply concerned my family and myself deeply since it became known to us. We are deeply concerned at the effect it will have on the quality of the food we eat, as we buy more than 50% of our groceries from local farms. We hold the position that if Rockwool comes to Jefferson county that we will be moving out of the county. Please don't destroy the Jefferson county with heavy industrial. My children love this county but I will not stay when it offers nothing besides pollution for my children. There are better ways to bring good jobs to Jefferson county.

Sincerely,

Kimberly Nason

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Brian Roberts

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would negatively affect tourism, economic agility, groundwater quality, and individual health in neighboring municipalities like Shepherdstown. In doing these things the industry that this zoning change provides for will adversely affect the health, safety, and welfare of our community.

Tourism is critically important to Shepherdstown's economy and to the county as a whole. In 2018, tourist spending in the Jefferson County contributed over \$170 million to state and local government revenue and \$213 million in individual earnings. Importantly, most of this money comes from tourists visiting from neighboring states like Virginia, Maryland, and Washington D.C. Out-of-state tourists are largely drawn to Jefferson County because of its reputation for environmental-friendly, sustainable industry. Key elements that support this reputation include the county's pastoral scenery and pristine natural resources. Ordinance #2017-302 will allow industry into Jefferson County that risks harming these elements and dramatically reducing the area's appeal to visitors. The resulting harm to our tourist industry would drive away visitors and decrease state, county, and local revenue. The long-term success of Jefferson County's tourism industry is dependent on local governments making coordinated zoning decisions. Allowing certain types in industry in Ranson will negatively affect tourism in every municipality throughout the county, including Shepherdstown. Voting no on ordinance #2017-302 will protect the foundations of the county's tourism industry and protect the 7,040 jobs in Jefferson County that are directly supported by tourism. In this way, the industry this zoning change will allow will adversely affect the welfare of our community.

The type of large, consolidated industry that ordinance #2017-302 would allow in Ranson would generally reduce the flexibility of local economies in Jefferson County. Historically, the driving industries in Jefferson County have been tourism, agriculture, and the equine industries. These three industries are large conglomerates of small businesses. Small business is very important

to Shepherdstown. Small businesses have been shown to create more jobs, cultivate more innovation, and provide more opportunities than big, non-local firms. Additionally, small businesses have been shown to be more reactive to sudden changes relative to manufacturing businesses. Bringing large, manufacturing-based industry into Jefferson county will depress the local economy and stifle innovation. During this time of economic upheaval and uncertainty, Jefferson County needs to support industries that will allow local economies to adapt and recover as fast as possible.

Voting no on ordinance #2017-302 will help protect water resources throughout Jefferson County. The type of industry that ordinance #2017-302 would allow puts the ground resources of Jefferson county at significant risk due to the karst hydrogeology. The site in Ranson is in the Rocky Marsh Run watershed, which is in the source water protection zone for Shepherdstown and drains to the Potomac River. Therefore, activity at this site will affect both groundwater and surface water streams. In municipalities like Shepherdstown, many residents and nearby farms depend on wells for water. Contamination of groundwater aquifers would create both health and remediation concerns for local residents. Dye tests performed by the USGS near the area of proposed rezoning in Ranson have shown just how far-reaching groundwater contamination at the Ranson site could be. Results from the USGS study revealed measurable dye concentrations in Elk's Run, Rattlesnake Run, and even the Shepherdstown Town Run. This last run cuts through the center of Shepherdstown and is a favorite area for children to play and learn to fish. In this way, the industry that this zoning change will allow will adversely affect the safety of our community.

Groundwater pollution is not the only concern for communities like Shepherdstown. The type of industry that ordinance #2017-302 would allow in Ranson would also generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. These pollutants are particularly harmful to children. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. The site in Ranson is across the road from an elementary school and also within the Jefferson High Middle district. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of children in Shepherdstown and all of Jefferson County. In this way, the industry that this zoning change will provide for will adversely affect the health of our community.

I again request that you vote no on ordinance #2017-302. This zoning change will allow industry that will adversely affect the health, safety, and welfare of our community. The long-term economic, environmental, and community health of municipalities like Shepherdstown depend on Ranson's participation in a coordinated zoning plan for all of Jefferson County.

Sincerely,

Gallagher Derek
Shepherdstown, 25443

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Angie Dymacek

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would negatively affect tourism, economic agility, groundwater quality, and individual health in neighboring municipalities like Shepherdstown. In doing these things the industry that this zoning change provides for will adversely affect the health, safety, and welfare of our community.

Tourism is critically important to Shepherdstown's economy and to the county as a whole. In 2018, tourist spending in the Jefferson County contributed over \$170 million to state and local government revenue and \$213 million in individual earnings. Importantly, most of this money comes from tourists visiting from neighboring states like Virginia, Maryland, and Washington D.C. Out-of-state tourists are largely drawn to Jefferson County because of its reputation for environmental-friendly, sustainable industry. Key elements that support this reputation include the county's pastoral scenery and pristine natural resources. Ordinance #2017-302 will allow industry into Jefferson County that risks harming these elements and dramatically reducing the area's appeal to visitors. The resulting harm to our tourist industry would drive away visitors and decrease state, county, and local revenue. The long-term success of Jefferson County's tourism industry is dependent on local governments making coordinated zoning decisions. Allowing certain types in industry in Ranson will negatively affect tourism in every municipality throughout the county, including Shepherdstown. Voting no on ordinance #2017-302 will protect the foundations of the county's tourism industry and protect the 7,040 jobs in Jefferson County that are directly supported by tourism. In this way, the industry this zoning change will allow will adversely affect the welfare of our community.

The type of large, consolidated industry that ordinance #2017-302 would allow in Ranson would generally reduce the flexibility of local economies in Jefferson County. Historically, the driving industries in Jefferson County have been tourism, agriculture, and the equine industries. These three industries are large conglomerates of small businesses. Small business is very important

to Shepherdstown. Small businesses have been shown to create more jobs, cultivate more innovation, and provide more opportunities than big, non-local firms. Additionally, small businesses have been shown to be more reactive to sudden changes relative to manufacturing businesses. Bringing large, manufacturing-based industry into Jefferson County will depress the local economy and stifle innovation. During this time of economic upheaval and uncertainty, Jefferson County needs to support industries that will allow local economies to adapt and recover as fast as possible.

Voting no on ordinance #2017-302 will help protect water resources throughout Jefferson County. The type of industry that ordinance #2017-302 would allow puts the ground resources of Jefferson County at significant risk due to the karst hydrogeology. The site in Ranson is in the Rocky Marsh Run watershed, which is in the source water protection zone for Shepherdstown and drains to the Potomac River. Therefore, activity at this site will affect both groundwater and surface water streams. In municipalities like Shepherdstown, many residents and nearby farms depend on wells for water. Contamination of groundwater aquifers would create both health and remediation concerns for local residents. Dye tests performed by the USGS near the area of proposed rezoning in Ranson have shown just how far-reaching groundwater contamination at the Ranson site could be. Results from the USGS study revealed measurable dye concentrations in Elk's Run, Rattlesnake Run, and even the Shepherdstown Town Run. This last run cuts through the center of Shepherdstown and is a favorite area for children to play and learn to fish. In this way, the industry that this zoning change will allow will adversely affect the safety of our community.

Groundwater pollution is not the only concern for communities like Shepherdstown. The type of industry that ordinance #2017-302 would allow in Ranson would also generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. These pollutants are particularly harmful to children. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. The site in Ranson is across the road from an elementary school and also within the Jefferson High Middle district. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of children in Shepherdstown and all of Jefferson County. In this way, the industry that this zoning change will provide for will adversely affect the health of our community.

I again request that you vote no on ordinance #2017-302. This zoning change will allow industry that will adversely affect the health, safety, and welfare of our community. The long-term economic, environmental, and community health of municipalities like Shepherdstown depend on Ranson's participation in a coordinated zoning plan for all of Jefferson County.

Sincerely,

Meghan Lusby-Treber
Harrisburg, 17111

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that will significantly harm the municipalities within Jefferson County and beyond effecting the health, welfare, and safety of our community. Harpers Ferry is a national treasure with the natural and historic resources tours flock to see each year and one of the communities that will be negatively impacted by this zoning change.

According to a 2019 study by the West Virginia Tourism Office, Jefferson County generated an average of \$178 million per year in tourism-derived revenue for state and local governments over the last 10 years, more than any other county in West Virginia by at least double. Tourism benefits the businesses and economy of Ranson and Jefferson County producing \$213.7 million in individual earning, 7040 jobs, and \$842.6 million in direct spending here in 2018. We would need 40 Project Shuttles to replace the individual earnings and 59 Rockwools to replace the jobs provided by the tourism industry in Jefferson County. It is important to note that most of the money generated by tourism in Jefferson County comes from neighboring states. In this way, it is like an export: not simply recycling money, but bringing money into the state increasing its wealth. Much of the economy in Harpers Ferry is based on this tourism industry. A threat to this industry poses a threat to the economy and welfare of our community.

One of the important drivers for tourism in Harpers Ferry is the Appalachian Trail. According to the Appalachian Trail Conservancy (ATC), Harpers Ferry is the psychologic midpoint of the Trail, and hikers often plan extended stays in Jefferson County with an obvious positive impact. The ATC reports that the smokestacks and associated lights will be visible in the viewshed of 15 vistas on the Appalachian Trail (AT). Studies have shown that quality of vistas and human impact on the environment are not only noticed by visitors, but effect their experience. Another study published in the Journal of Applied Recreation Research, found that points of interests and views drew visitors' attention and had a significant impact on their perception of the trail. It was also found that particularly beautiful vistas helped visitors overlook elements

that usually have a negative effect on trail experience like increased trail traffic. A 2009 study in Leisure Sciences revealed that scenic value was a perceptual theme of Appalachian Trail visitors, and that things as simple as dead trees visible in a vista can have a negative impact on visitors' overall perception. Imagine the effect the smokestacks will have from the 15 vistas from which they will be visible. The introduction of industrial activity made possible by the proposed rezoning in Ranson would have a negative effect on the scenic views of beautiful landscapes from the Appalachian Trail in Jefferson County.

The smokestacks are not all visitors will be able to see — the air pollution will create haze. The effect of regional haze on tourists was explored in a review article published in the Atmospheric Environment titled "Impaired visibility: the air pollution people see." A key takeaway on the negative affect of haze on vacationing tourists was summarized as follows:

"Vacations offer an escape from the routine and stress of our daily lives. Vacation destinations are often chosen based on their scenery; vacations are spent gazing at monuments, mountains, clouds, and oceans. Good visibility allows clear observation of distant features and appreciation of the inherent beauty of these scenes...Air pollution, which is often present in both our cities and parks, interferes with these attributes and can ruin the views vacationers travel to enjoy."

People seek bucolic, unspoiled areas to escape the stresses of urban areas. A 2004 study in Environment and Behavior found perceived pollution causes stress while viewing natural scenes has both psychological and physiological benefits, and a 2007 study confirmed these benefits. Two other studies found that people are emotionally affected by poor visibility, and tourists are disappointed when views are obscured by haze.

The combination of smokestacks and haze will mar the viewshed and will not only reduce the positive effects of a scenic landscape but also leave tourists disappointed and dissatisfied with their choice of destination. With these effects the welfare of the Harpers Ferry community would undoubtedly be endangered by the industry that this zoning change will provide for.

Multiple studies by doctors Kozar, Doctor, and Doctor have demonstrated that the land at this site to be rezoned is Karst with the highest likelihood of sinkhole development in the county, and that the groundwater aquifer there is incredibly sensitive to contamination from surface water. Further, this site is on an upland plain with relatively few surface streams, seasonal variability in the water table that results in numerous estavelles, and large amounts of water in the epikarst. In this area contamination in surface water communicates easily to the water in the epikarst via diffuse and point infiltration, and the springs at the margins of the upland area are directly affected by the water quality throughout the aquifer. According to Jefferson Orchards Voluntary Remediation Plan with the WVDEP, the groundwater at the site is approximately 60 feet below the ground, and the tests performed by the USGS have shown that groundwater from just adjacent to this site emerged in the headwaters of both the Elk's Run and Rattlesnake Run. This is critically important for Harpers Ferry because the Elk's Run headwaters is a spring about three miles southeast of the site and goes on to become the drinking water source for Harpers Ferry and Bolivar before emptying into the Potomac River.

The headwaters of Rattlesnake Run is a spring about 3.5 miles from the site and is also a tributary of the Potomac River. The Potomac River is the back up water source for Harpers Ferry. This means that the activity at the site will have a critical influence on the drinking water of Harpers Ferry. In this was the industry permitted by this change in zoning would undoubtedly endanger the health and safety of the community in Harpers Ferry.

The untoward health effects and individual economic consequences from the pollution emissions of the industry this rezoning will allow that will be born out over the length of people's lives and that of their decedents for at least three generations is an egregious example of environmental injustice that should not be tolerated. This zoning change may be in one of the poorest sections of the county, but the effects will be felt in every part of Ranson and the county.

The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." The industry that this rezoning will allow will jeopardize the health, safety and welfare of Ranson, Harpers Ferry and the whole county. Please vote no on the ordinance #2017-302.

Sincerely,

Brandi Meade

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would have a negative effect on water and air quality in neighboring states such as Maryland.

The Potomac River provides drinking water and a source of recreation to Maryland residents. Water and air pollution generated within the Potomac River's watershed will inevitably contaminate this valuable waterway. The site of the proposed zoning change in Ranson is located within the Potomac River Watershed.

The type of industry that ordinance #2017-302 would allow in Ranson would utilize large water impoundments, in an area of known karst terrain. This water will be contaminant from several sources including particulate mater that has fallen out from the air emissions and process water. The West Virginia Department of Environmental Protection has published guidelines that specifically discourage extensive development in areas of karst terrain because of the vulnerability of karst aquifers to contamination by surface pollution. Karst features increase surface water and groundwater connectivity and any spills or surface releases quickly percolate into the groundwater. Additionally, sinkholes are common in karst terrain and can cause ruptures in wastewater impoundments. Even if appropriate attempts are made to contain and manage wastewater and other stormwater runoff on-site, there is still a high risk that wastewater could contaminate the groundwater through tears and catastrophic failure of wastewater impoundments. Contaminated groundwater in karst terrain can easily resurface in waterways several miles away, as shown by a USGS tracer study conducted near the site in to be rezoned. The USGS study detected tracer dye in multiple springs and waterways miles from the initial injection site in Ranson. All of these waterways drain into the Potomac River.

Mismanagement of wastewater could also lead to contamination of nearby surface waters. For example, the site of the proposed rezoning in Ranson is in the Rocky Marsh Run watershed.

Rocky Marsh Run also drains to the Potomac River. Voting no on ordinance #2017-302 will preserve downstream water quality and help ensure that the Potomac River remains usable for Maryland residents.

Air pollution poses another risk to Maryland residents. The type of industry that ordinance #2017-302 would allow would generate air pollutants like fine particulate matter. According to the US EPA, fine particulates can travel 100s of miles from its original source. Air pollution related to industrial activity in Ranson could easily reach Maryland. Fine particulates have a greater affinity for carrying toxic compounds and their small size allows them to be inhaled more deeply into the lungs. Chronic exposure to fine particulate matter is associated with increased risk of several diseases including Alzheimer's in adults. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease among others. Fine particulate matter also exacerbates regional haze which creates a visible reminder of air pollution. The psychological effects that arise from an increased perception of pollution include stress, anxiety, and unhappiness. Voting no on ordinance #2017-302 will help prevent increased air pollution from negatively affecting the long-term health of Maryland residents.

The industry that this zoning will provide for will threaten the health, safety, and welfare of the residents in Maryland, and this land is not well-suited for industrial use. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." To achieve this, the council must not approve this proposed zoning change.

I again request that you vote no on ordinance #2017-302. Zoning decisions in Ranson and Jefferson County have an undeniable influence on the quality of life in neighboring states.

Sincerely,

Alicia Henning

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Scott Siler

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

From a Jefferson County resident: Whatever was the reason to approve heavy industry in this county, whatever seemed like a good idea at the time, it is so clearly obvious now that we need to change course. So much information about the detrimental effects -- and the probable and possible long-term irreversible detrimental effects -- of the zoning change have come to light that given a chance to reverse the earlier decision, I ask that you take it. Please don't allow our beautiful county to become a site for heavy industry. There are almost no benefits to anyone outside of the management of Rockwool.

I live right outside of the city of Shepherdstown and rely on well water. If / when there is an accident and the groundwater is contaminated -- and we know that accidents happen all the time -- there will be no going back. It's over with, a natural resource gone. That responsibility to protect us and the future of this county rests with those who have the power to control the zoning of the county. Imagine the possible outcomes, good and bad, and decide which side you want to be on, which future you choose for this county. Choose the future that doesn't include air and water pollution, noise and light 24 hours a day, heavy traffic -- and lowered property values. There are so many great alternatives! Work with people with the best interests of Jefferson County foremost, not those most interested in profits for themselves.

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would negatively affect tourism, economic agility, groundwater quality, and individual health in neighboring municipalities like Shepherdstown. In doing these things the industry that this zoning change provides for will adversely affect the health, safety, and welfare of our community.

Tourism is critically important to Shepherdstown's economy and to the county as a whole. In 2018, tourist spending in the Jefferson County contributed over \$170 million to state and local government revenue and \$213 million in individual earnings. Importantly, most of this money

comes from tourists visiting from neighboring states like Virginia, Maryland, and Washington D.C. Out-of-state tourists are largely drawn to Jefferson County because of its reputation for environmental-friendly, sustainable industry. Key elements that support this reputation include the county's pastoral scenery and pristine natural resources. Ordinance #2017-302 will allow industry into Jefferson County that risks harming these elements and dramatically reducing the area's appeal to visitors. The resulting harm to our tourist industry would drive away visitors and decrease state, county, and local revenue. The long-term success of Jefferson County's tourism industry is dependent on local governments making coordinated zoning decisions. Allowing certain types in industry in Ranson will negatively affect tourism in every municipality throughout the county, including Shepherdstown. Voting no on ordinance #2017-302 will protect the foundations of the county's tourism industry and protect the 7,040 jobs in Jefferson County that are directly supported by tourism. In this way the industry this zoning change will allow will adversely affect the welfare of our community.

The type of large, consolidated industry that ordinance #2017-302 would allow in Ranson would generally reduce the flexibility of local economies in Jefferson County. Historically, the driving industries in Jefferson County have been tourism, agriculture, and the equine industries. These three industries are large conglomerates of small businesses. Small business is very important to Shepherdstown. Small businesses have been shown to create more jobs, cultivate more innovation, and provide more opportunities than big, non-local firms. Additionally, small businesses have been shown to more reactive to sudden changes relative to manufacturing businesses. Bringing large, manufacturing-based industry into Jefferson county will depress the local economy and stifle innovation. During this time of economic upheaval and uncertainty, Jefferson County needs to support industries that will allow local economies to adapt and recover as fast as possible.

Voting no on ordinance #2017-302 will help protect water resources throughout Jefferson County. The type of industry that ordinance #2017-302 would allow puts the ground resources of Jefferson county at significant risk due to the karst hydrogeology. The site in Ranson is in the Rocky Marsh Run watershed, which is in the source water protection zone for Shepherdstown and drains to the Potomac River. Therefore, activity at this site will affect both groundwater and surface water streams. In municipalities like Shepherdstown, many residents and nearby farms depend on wells for water. Contamination of groundwater aquifers would create both health and remediation concerns for local residents. Dye tests performed by the USGS near the area of proposed rezoning in Ranson have shown just how far-reaching groundwater contamination at the Ranson site could be. Results from the USGS study revealed measurable dye concentrations in Elk's Run, Rattlesnake Run, and even the Shepherdstown Town Run. This last run cuts through the center of Shepherdstown and is a favorite area for children to play and learn to fish. In this way, the industry that this zoning change will allow will adversely affect the safety of our community.

Groundwater pollution is not the only concern for communities like Shepherdstown. The type of industry that ordinance #2017-302 would allow in Ranson would also generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. These pollutants are particularly harmful

to children. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. The site in Ranson is across the road from an elementary school and also within the Jefferson High Middle district. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of children in Shepherdstown and all of Jefferson County. In this way, the industry that this zoning change will provide for will adversely affect the health of our community.

I again request that you vote no on ordinance #2017-302. This zoning change will allow industry that will adversely affect the health, safety, and welfare of our community. The long-term economic, environmental, and community health of municipalities like Shepherdstown depend on Ranson's participation in a coordinated zoning plan for all of Jefferson County.

Sincerely,

Terry Thorson

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask that you vote no on Ordinance #2017-302. While not in Ranson, the land and homes around the property that is the subject of the zoning change are closer to the property than anyone who currently lives within the city limits of Ranson. This area will be affected sooner and more harshly by the environmental issues that will develop secondary to the inappropriate siting of industry this zoning would allow.

The subject land has been well studied by Drs. Kozar, Doctor and Doctor and described in the scientific literature and USGS reports as having karst hydrology with very high aquifer vulnerability. The karst landscape is a consequence of the presence of soluble bedrock, which consists of limestone in the case of the subject land. In such landscapes water percolates through the ground and dissolves the underlying rock creating a porous network of caverns and throughways. Karst aquifers are known to be "extremely vulnerable to pollution" due to direct connection between the surface water and groundwater through both point (sinkholes) and diffuse (everywhere) infiltration. It is known from the Voluntary Remediation Plan of Jefferson Orchard that the groundwater at the subject site is only 60 feet below the ground. The subject property and much of the property around it are on an upland plain with few surface streams, but great seasonal variability in the water table resulting in numerous esteves and large amounts of water in the epikarst. This water is easily contaminated and this contamination spreads quickly throughout the aquifer. Dye tests performed near the subject site by the USGS have demonstrated this quick moving thorough dispersment in the aquifer in this area. While this contamination goes on to affect springs at the margins of the upland area continuing on in streams that service municipal water sources and the Potomac River, our concerns are far more immediate in both time and distance. Well water is the only water source available in the area of the proposed zoning change and, with the exception of Fox Glen, a majority of this water is supplied by private wells. Therefore, the groundwater aquifer fulfills a critical necessity, fulfilling all needs including human consumption, household uses, and agriculture and

maintenance of livestock and horses in the immediate area around the site. The concern is that if the aquifer becomes contaminated, then the local drinking water will be fouled.

For decades now, policy makers have been using “Aquifer Vulnerability,” to set land use and water resource protection policy. Karst has very high Aquifer Vulnerability. Therefore, this industrial use is not appropriate for this land and it should not be zoned for it. The guiding documents of the WVDEP recognize this. The introduction to the WVDEP document Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.”

The Chesapeake Bay Stormwater Network karst stormwater guidance document the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed, which the WVDEP cites in its own guiding document Stormwater Management Design in Karst Areas, clearly agrees stating:

“First, the effect of land development on karst terrain is complex and hard to predict, and requires professional analysis to reduce the risk of geological hazards, damage to infrastructure and groundwater contamination.” “The working group acknowledges that past approaches to stormwater and land development in karst terrain have been inadequate to safeguard the public and the environment.” “...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” We clearly need stronger comprehensive land use plans and zoning that direct new growth away from karst areas to more appropriate locations. Ordinance #2017-302 is literally the opposite of this.

Further, we cannot rely on the WVDEP to do the job that good local land use guidelines and zoning should do. For example, the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed states that detention and retention ponds are not recommended on karst and categorize them as discouraged. Also, quoting WVDEP’s own karst guidance: “attenuating surface runoff will increase the rate of sinkhole formation and potential groundwater contamination.” Yet the entity currently planning to utilize this zoning change is planning employment of multiple massive retention ponds and attenuating surface runoff completely. This has already been approved by the DEP in two Construction Stormwater General Permit registrations for that company. One of detention ponds is not even regulated by the DEP as it contains process water and has no outlet. Clearly the DEP recognizes the risks but is not appropriately limiting them. Relying on the DEP to protect the public health, safety, welfare, and the environment from any entity in these karst locations is simply as the CNS bulletin said it “inadequate to safeguard the public and the environment.” We must have appropriate zoning that takes into consideration appropriate use of land with karst hydrogeology. Ordinance #2017-302 does not do this, but instead increases the risk to the public and the environment.

A second serious concern is the air emissions from the industry that this zoning will provide for. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. These types of air emissions have been shown to increase the risk of, contribute to, and exacerbate a multitude of developmental, physical, physiological, physiological, cognitive and economic. The exposure of one individual can cause repercussions in multiple generations. Embryos, fetuses, and children are most vulnerable with effects born out over a lifetime, and that of their offspring. Many of these effects only require short-term exposure and some have even been shown to occur at levels below current limits recommended by the World Health Organization. One example of this is that a recent study found that “Even within the limits set by the World Health Organization, the pollutants PM₁₀, SO₂, NO₂, and O₃ are associated with increased risk of treatment for respiratory diseases in children 0 to 6 years of age.” Unfortunately, the US limits are higher than WHO, 300 % higher in the case of PM₁₀!

In fact, in 2019, in the Advice from the Independent Particulate Matter Review Panel (formerly U.S. EPA Clean Air Scientific Advisory Committee Particulate Matter Review Panel) on EPA’s Policy Assessment for the Review of the National Ambient Air Quality Standards for Particulate Matter, it stated that the committee unanimously and unequivocally found that the current primary annual and 24-hour PM_{2.5} National Ambient Air Quality Standards (NAAQS) are not adequate to protect public health. The advice from this 20-member committee, whose scientific disciplines include epidemiology, medicine, toxicology, air quality measurement, air quality modeling, exposure assessment measurement and modeling, risk assessment, statistics, and others, was ignored due presumably to political pressure. Not only are the NAAQS too high in some cases, but due to the measure and mechanism by which they work, they can not replace the safety provided by good land use and zoning regulations, that are meant to do things like keep factories with air emissions and hundreds of heavy trucks away from elementary schools. In fact, there is a state law that prohibits siting a school near a factory. Unfortunately, the reciprocal law does not exist. Clearly, just like with the water resources, we cannot rely on the DEP or the EPA to do the job of what appropriate zoning should do. The whole point of zoning is to keep people safe and provide for their health and welfare. Ordinance #2017-302 puts families and school children directly in harms way.

The air emissions, threat to the groundwater, and the very presence of the industry that this zoning change will allow for will have a serious negative economic effect on those who live and or work closest to the site in question. Productivity and workforce participation will be negatively affected by the health effects of the air emissions. The local agricultural operations will be negatively affected by the air emissions with lower quantity and quality of crop yield and would be devastated if the ground water aquifer were fouled. The equine operations in the area, of which there are several, will be negatively affected by the air emissions as they affect the horses’ health and performance. The mere presence of the industry that will be provided for by this zoning change will cause property values to fall. There will be serious economic consequences for the immediate area around the site in question.

Several of the communities in the immediate area of the site for proposed zoning change are traditionally underserved and have lower economic status. The choice of this location for such a zoning change represents an egregious example of environmental injustice that should not be promulgated or tolerated.

This zoning change will provide for industry that will negatively affect the health safety and welfare of our community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Tim Brennan

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask you to vote NO on Ordinance #2017-302. The industry this zoning change will allow for endangers the health, safety and, welfare of the community, and violates the premise of the smart code zoning that we have spent so much time, effort and federal money employing.

Any change in zoning needs to align with the comprehensive plan. In Ranson's current comprehensive plan (2012), the city only refers to "heavy industry" in the history section. Here it is characterized as part of a bygone era that has been replaced by an emphasis on agriculture for local food production, open spaces, and quality-of-life. In the remainder of the document, the word industry is used loosely to describe businesses including flower shops and shoe stores. Nothing that resembles the industry that this zoning change will provide for is described in the current comprehensive plan of Ranson.

In the land use section of the comprehensive plan, number ten states:

"Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The comprehensive plan clearly states that the city will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community. This change in zoning clearly negatively affects the health, safety, and welfare of the community.

As the zoning is proposed, the industry that this zoning change will allow for will be directly across the street from houses, parks and other small businesses. A densely populated subdivision and an elementary school already exit directly across the street. While these latter

community sections are not in the city limits, the effect of this zoning on them should still be considered just the same as it would be if they were in the city limits.

The industry that this zoning change will provide for will produce particulate, gaseous, and hazardous air emissions. These emissions have been shown to be detrimental to human health at every stage of life from embryo to old age. In utero and childhood exposure are the most damaging with lasting effects being realized through out life, and with maternal exposure the effects can be felt for generations. Multiple organ systems are affected including respiratory, cardiovascular, neurologic, immune, and endocrine causing defects in multiple processes including in utero development, neurodevelopment, immune and tolerance development, and cognitive defects. There are also psychological, social, and economic effects from both perceived and actual air pollution in both children and adults. Many of these effects can be seen even with short-term exposure or exposure that is lower than the levels recommended by the US Environmental Protection Agency and World Health Organization. These consequences are devastating to the individual and depressing to the local community and economy. State law does not allow a school to be built next to industry that this zoning will allow but yet we are contemplating changing the zoning so this industry can build next to a school. This does not make sense. As Ranson residents, we want Ranson to follow the lead of the state and keep polluting industry away from kids. In these ways, this change in zoning will negatively affect the health and welfare of the community.

In addition to the health effects of the air emissions is the threat to groundwater from the industry that this zoning change would allow. The land in question has karst hydrogeology and therefore very high aquifer vulnerability and is not appropriate for this industry. With the type of industry this zoning will provide for, combined with high aquifer vulnerability, the likelihood of groundwater contamination is too high for the community and region to bear. A USGS study demonstrated that contamination in the groundwater adjacent to the site moves relatively quickly and can be found in wells and surface water structures in a variety of locations in the County. In this way, contamination at the site would affect the drinking water of the great majority of Jefferson County residents. Through the surface water connections, the water at the site also affects the water resources of the region.

Aquifer vulnerability has been used by policy makers for decades to set land use regulations. The guiding document, from the WVDEP, Stormwater Management Design in Karst Areas states, "it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." In Ranson, we need to follow this advice and not change the zoning of this land for use by industry that has among the highest aquifer vulnerability in the County. This zoning change will endanger the safety of the community and region by endangering the safe water resources. As Ranson residents, we want to safeguard the water resources of the county and region by following the WVDEP guidance here.

Further, by reallocating this transect district and replacing it with a monolithic block of Special District Industrial designation, hundreds of housing units, parks and space for small businesses are lost. Ranson loses the potential for property tax on these properties and their improvements, Business and Occupational tax on the businesses and sales tax in retail stores. The community loses out on the opportunity to develop affordable housing and create locations where people can live, work, play, and shop all in the same place reducing the need for travel.

Worse yet apparently a deal has been made where the entity that owns the subject land has required that a litany of things not be built on the adjacent land essentially stripping the purpose of the smart code transect zone that exists there. Transect zones in the smart code are meant to transition, from out to in, and provide communities where people can safely work and live in close proximity in an effort to reduce travel. Excluding many of the components of the transect zone effectively eliminates the features that make it a transect zone, thus, losing the benefits a transect zone offers the community and city. By losing these benefits, reducing the overall and affordable housing prospects, and reducing so drastically the opportunities for city income, this zoning change will negatively affect the welfare of the community.

As Ranson residents, we find it odd that we are changing zoning to provide for industry that we would not put in the middle of our town close to our residents, but we are placing it close to the homes of county residents. Further, it is striking that the area where this change in zoning is directly adjacent to historically underserved lower income communities and a Title I school. This amounts to environmental injustice and cannot be tolerated.

The purpose of zoning is for a city to protect the health, welfare, morals and safety of the community. In this case, the air emissions and heavy truck traffic will endanger the communities' health. The threat of water contamination will endanger the safety of the community. The effect of lost productivity and decreased workforce participation due to increased illness and the negative effect the air emissions and presence of such a factory will have on the local economy will negatively affect the welfare of the community. The environmental injustice of changing the zoning to accommodate such polluting industry in a location where your municipality has no residents, but yet hundreds of low income and underserved county residents live is egregiously amoral. This must not happen. We respectfully implore you to do the right thing and vote no on ordinance #2017-302.

Sincerely,

Lee Slavin

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

pat Phillips

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Dana Anders

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask that you vote no on Ordinance #2017-302. While not in Ranson, the land and homes around the property that is the subject of the zoning change are closer to the property than anyone who currently lives within the city limits of Ranson. This area will be affected sooner and more harshly by the environmental issues that will develop secondary to the inappropriate siting of industry this zoning would allow.

The subject land has been well studied by Drs. Kozar, Doctor and Doctor and described in the scientific literature and USGS reports as having karst hydrology with very high aquifer vulnerability. The karst landscape is a consequence of the presence of soluble bedrock, which consists of limestone in the case of the subject land. In such landscapes water percolates through the ground and dissolves the underlying rock creating a porous network of caverns and throughways. Karst aquifers are known to be "extremely vulnerable to pollution" due to direct connection between the surface water and groundwater through both point (sinkholes) and diffuse (everywhere) infiltration. It is known from the Voluntary Remediation Plan of Jefferson Orchard that the groundwater at the subject site is only 60 feet below the ground. The subject property and much of the property around it are on an upland plain with few surface streams, but great seasonal variability in the water table resulting in numerous esteves and large amounts of water in the epikarst. This water is easily contaminated and this contamination spreads quickly throughout the aquifer. Dye tests performed near the subject site by the USGS have demonstrated this quick moving thorough dispersment in the aquifer in this area. While this contamination goes on to affect springs at the margins of the upland area continuing on in streams that service municipal water sources and the Potomac River, our concerns are far more immediate in both time and distance. Well water is the only water source available in the area of the proposed zoning change and, with the exception of Fox Glen, a majority of this water is supplied by private wells. Therefore, the groundwater aquifer fulfills a critical necessity, fulfilling all needs including human consumption, household uses, and agriculture and

maintenance of livestock and horses in the immediate area around the site. The concern is that if the aquifer becomes contaminated, then the local drinking water will be fouled.

For decades now, policy makers have been using “Aquifer Vulnerability,” to set land use and water resource protection policy. Karst has very high Aquifer Vulnerability. Therefore, this industrial use is not appropriate for this land and it should not be zoned for it. The guiding documents of the WVDEP recognize this. The introduction to the WVDEP document Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.”

The Chesapeake Bay Stormwater Network karst stormwater guidance document the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed, which the WVDEP cites in its own guiding document Stormwater Management Design in Karst Areas, clearly agrees stating:

“First, the effect of land development on karst terrain is complex and hard to predict, and requires professional analysis to reduce the risk of geological hazards, damage to infrastructure and groundwater contamination.” “The working group acknowledges that past approaches to stormwater and land development in karst terrain have been inadequate to safeguard the public and the environment.” “...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” We clearly need stronger comprehensive land use plans and zoning that direct new growth away from karst areas to more appropriate locations. Ordinance #2017-302 is literally the opposite of this.

Further, we cannot rely on the WVDEP to do the job that good local land use guidelines and zoning should do. For example, the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed states that detention and retention ponds are not recommended on karst and categorize them as discouraged. Also, quoting WVDEP’s own karst guidance: “attenuating surface runoff will increase the rate of sinkhole formation and potential groundwater contamination.” Yet the entity currently planning to utilize this zoning change is planning employment of multiple massive retention ponds and attenuating surface runoff completely. This has already been approved by the DEP in two Construction Stormwater General Permit registrations for that company. One of detention ponds is not even regulated by the DEP as it contains process water and has no outlet. Clearly the DEP recognizes the risks but is not appropriately limiting them. Relying on the DEP to protect the public health, safety, welfare, and the environment from any entity in these karst locations is simply as the CNS bulletin said it “inadequate to safeguard the public and the environment.” We must have appropriate zoning that takes into consideration appropriate use of land with karst hydrogeology. Ordinance #2017-302 does not do this, but instead increases the risk to the public and the environment.

A second serious concern is the air emissions from the industry that this zoning will provide for. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. These types of air emissions have been shown to increase the risk of, contribute to, and exacerbate a multitude of developmental, physical, physiological, physiological, cognitive and economic. The exposure of one individual can cause repercussions in multiple generations. Embryos, fetuses, and children are most vulnerable with effects born out over a lifetime, and that of their offspring. Many of these effects only require short-term exposure and some have even been shown to occur at levels below current limits recommended by the World Health Organization. One example of this is that a recent study found that “Even within the limits set by the World Health Organization, the pollutants PM₁₀, SO₂, NO₂, and O₃ are associated with increased risk of treatment for respiratory diseases in children 0 to 6 years of age.” Unfortunately, the US limits are higher than WHO, 300 % higher in the case of PM₁₀!

In fact, in 2019, in the Advice from the Independent Particulate Matter Review Panel (formerly U.S. EPA Clean Air Scientific Advisory Committee Particulate Matter Review Panel) on EPA’s Policy Assessment for the Review of the National Ambient Air Quality Standards for Particulate Matter, it stated that the committee unanimously and unequivocally found that the current primary annual and 24-hour PM_{2.5} National Ambient Air Quality Standards (NAAQS) are not adequate to protect public health. The advice from this 20-member committee, whose scientific disciplines include epidemiology, medicine, toxicology, air quality measurement, air quality modeling, exposure assessment measurement and modeling, risk assessment, statistics, and others, was ignored due presumably to political pressure. Not only are the NAAQS too high in some cases, but due to the measure and mechanism by which they work, they can not replace the safety provided by good land use and zoning regulations, that are meant to do things like keep factories with air emissions and hundreds of heavy trucks away from elementary schools. In fact, there is a state law that prohibits siting a school near a factory. Unfortunately, the reciprocal law does not exist. Clearly, just like with the water resources, we cannot rely on the DEP or the EPA to do the job of what appropriate zoning should do. The whole point of zoning is to keep people safe and provide for their health and welfare. Ordinance #2017-302 puts families and school children directly in harms way.

The air emissions, threat to the groundwater, and the very presence of the industry that this zoning change will allow for will have a serious negative economic effect on those who live and or work closest to the site in question. Productivity and workforce participation will be negatively affected by the health effects of the air emissions. The local agricultural operations will be negatively affected by the air emissions with lower quantity and quality of crop yield and would be devastated if the ground water aquifer were fouled. The equine operations in the area, of which there are several, will be negatively affected by the air emissions as they affect the horses’ health and performance. The mere presence of the industry that will be provided for by this zoning change will cause property values to fall. There will be serious economic consequences for the immediate area around the site in question.

Several of the communities in the immediate area of the site for proposed zoning change are traditionally underserved and have lower economic status. The choice of this location for such a zoning change represents an egregious example of environmental injustice that should not be promulgated or tolerated.

This zoning change will provide for industry that will negatively affect the health safety and welfare of our community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Robert Ruggiero

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on #2017-302. The air emissions, possibility of ground and surface water contamination, and their effect on our interwoven economies threaten the health, safety and welfare of not just Jefferson County but the greater region, including Loudoun and the greater Northern Virginia area.

This zoning would provide for industry that produces large amounts of air emissions. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. Northern Virginia is directly downwind from these emissions. Much of the gaseous, fine particulate, and hazardous emissions can reach Northern Virginia. Further affecting the outdoor air quality of the adjacent portion of Virginia and the ability of these areas to achieve and maintain National Ambient Air Quality Standards (NAAQS) attainment. This will affect agriculture and outdoor leisure and recreation.

For example, Loudoun County has been in nonattainment for the NAAQS 8-hour Ozone standard for the past two years. VOC and NO_x react after they have been emitted to produce ground level ozone. The industry that this rezoning would provide for would produce large amounts of these emissions. This would make it even harder as Loudoun County tries to achieve attainment. As time goes on and the scientific research advances our knowledge and understanding of the extent to which gaseous, particulate and hazardous emissions affect human health the NAAQS standards are likely to be reduced. The effects on air emission from this rezoning will make it only harder for Loudoun and Northern Virginia to meet these standards.

In addition to the concerns about the air, the possible ground and surface water contamination is very concerning to Loudoun and Virginia residents. The site is known to have ground water that is vulnerable to contamination due to the karst hydrogeology. A USGS study demonstrated that the ground water adjacent to the site to be rezoned communicates readily with surface

water tributaries of the Potomac River. In addition to direct infiltration where water moves directly from the surface to groundwater via porous limestone bedrock, karst is known to have severe ground instability problems. This makes karst geology prone to sinkhole development. Sinkholes provide direct connection between the surface water and any contaminants it may contain and the groundwater. This makes the aquifer vulnerability in karst areas very high, and contamination with industrial activity such as that provided for by this rezoning too likely. In this way, this zoning change will adversely affect the health and welfare of individuals and the community.

Loudoun sources its drinking water from the Potomac River, downstream of many West Virginia tributaries that carry water from the epikarst and groundwater aquifer at the site to be rezoned. Loudoun has recently completed the new Trap Rock Water Treatment facility, which draws water from the Potomac River. Loudoun currently provides 40 million gallons and projects to provide 90 million gallons of drinking water a day to customers by 2040 (Loudounwater.org). Therefore, the viability of the Potomac River is a high priority for Virginia residents.

Loudoun and Northern Virginia is one of the fastest growing communities in the country and provides a lot to Jefferson County in their symbiotic relationship. Virginia residents support and enjoy Jefferson County through tourism, as our residents enjoy the natural and historical resources of your county. Virginia residents and businesses support the equine industry in a multitude of ways from providing wagering fans at the races to the Virginia Breeders Association Virginia Certified incentive programs and a strong market for retired racehorses. According to an economic impact study from WVU, at least 40% of Jefferson County residents travel outside of West Virginia for work, a good percentage of those travel to northern Virginia. This rezoning would allow for industry that would negatively affect the economy of both places and this relationship and the benefits for our residents gleaned from it.

This zoning change will provide for industry that will negatively effect the health safety and welfare of the Loudoun and Northern Virginia community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Nadine Dery

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote NO on Ordinance #2017-302. This rezoning will put an undue hardship on the wastewater treatment systems, burden the rate payers and risk surface waterways in Charles Town, risking the health, safety and welfare of the community. The comprehensive plan of Ranson states, the City "will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community." Therefore, please vote NO on #2017-302.

The nature of the industry that this zoning will allow will be harmful to our local economy. Charles Town has spent a lot of time and money improving our downtown area for restaurants and retail. We are working to take advantage of the tourism industry in our county and bring more people into Charles Town. The eye sore, noise pollution, air pollution, and obvious move away from sustainability will drive people away from Jefferson County and Charles Town, rendering our efforts ineffective and unrewarding. This will make it harder for our small businesses to be successful. In this way, the industry this zoning will provide for will adversely affect the welfare of our community.

According to the 2018 WVU economic study of the eastern panhandle, over 40% of the workforce in Jefferson County choose to work outside of the state. These commuters bring that money home and spend it here supporting our local small businesses, economy and government. Charles Town has a large number of residents who commute. These typically higher earners may choose to leave the area because of the presence of the industry that this zoning change would provide for. This will cause a hardship on our economy and municipality. In this way, the industry this zoning will provide for will adversely affect the welfare of our community.

The industry that this zoning will allow will cause stress for multiple reasons on the Charles Town wastewater treatment systems and the surface waterways in Jefferson County and

beyond. The industry currently planning to utilize the zoning change will have discharge to the wastewater system that is high in chloride, primarily from its water softening system. The NPDES permit modification allows up to 5,000 mg/L. Chloride is not settled or removed at the wastewater treatment plant. It cannot be removed by conventional means and would be prohibitively expensive to do by new technology. This is of concern to Charles Town because chloride can harm stream water and also impair functioning of the wastewater treatment plant. Furthermore, the corrosive nature of chloride can cause damage to pipes both in the wastewater system and those used by downstream drinking water systems, like the \$207 million Trap Rock Water Treatment plant in Loudoun.

The human health criteria for chloride under WV standards is 250 mg/L. Under low stream flow conditions, chloride additions to the treatment plant effluent, as proposed by the industry currently planning to utilize the zoning change, could cause chloride levels in Evitts Run to exceed this standard. If the amount of chloride increased due to expansion or higher throughput, then this human health standard would be violated frequently. Chlorides are also known to harm aquatic life and effect metal toxicity in rivers. The USEPA and several states have surface water guidelines of 230mg/L for chronic exposure. This would also pose a risk of damaging the water treatment facilities downstream on the Potomac River.

A research study by Lefebvre and Moletta in 2006 showed that chloride and salinity impair the ability of wastewater treatment to remove phosphorus and nitrogen, and because of this, other states have introduced legislation to treat saline wastewater. Uygur and Kargi in 2004 looked at the effects of salt on synthetic wastewater treatment. They found that removal of both nitrogen and phosphorus was reduced when salinity increased from 0 to 6%. In fact, the removal efficiency of ammonia dropped from 96% to 39% with this increasing salinity. Hong et al. In 2016 found phosphorous removal decreased 20-28% when chloride concentrations went from 150 mg/L to 1,500 mg/L. Phosphorous removal was completely inhibited at concentrations greater than 2,500 mg/L. This increased salinity has the potential to make the Charles Town wastewater treatment system work far less efficiently.

In addition to the contents of the wastewater this type of industry will produce, the volume of sewage is itself a concern. Given that the City of Charles Town has been in violation of its permit on numerous occasions for spills and overflow of untreated sewage, adding large volumes of wastewater will further challenge the near capacity system. This will mean that costly capacity upgrades will need to be done likely sooner than they would have needed to be done, imposing further financial strain on the system. Through these effects, the industry this zoning will provide for will adversely effect the health, safety, and welfare of the community.

This zoning change will provide for industry the likes of which are not present in this county and have not been present in this county for many decades. We find it appalling that the introduction of zoning for such industry is being done in an area of the county that is historically underserved and lower income. It is even more egregious because the worst effects including air pollution and groundwater contamination will be felt first and most severely in the immediate vicinity, and Ranson does not even have residents in the immediate vicinity of the

proposed zoning change. This decision is being contemplated without representation of those who will be most affected. This would be a deplorable example of environmental injustice.

This zoning will provide for industry that will harm our economy, drive away residents, challenge and or damage our infrastructure, and may damage our waterways and wild life. Through these effects, the industry this zoning would allow will adversely effect the health, safety, and welfare of our community. This is being done with out representation of those it will affect the most. Please vote No on Ordinance #2017-302.

Sincerely,
Jeananne Shultz

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask that you vote no on Ordinance #2017-302. While not in Ranson, the land and homes around the property that is the subject of the zoning change are closer to the property than anyone who currently lives within the city limits of Ranson. This area will be affected sooner and more harshly by the environmental issues that will develop secondary to the inappropriate siting of industry this zoning would allow.

The subject land has been well studied by Drs. Kozar, Doctor and Doctor and described in the scientific literature and USGS reports as having karst hydrology with very high aquifer vulnerability. The karst landscape is a consequence of the presence of soluble bedrock, which consists of limestone in the case of the subject land. In such landscapes water percolates through the ground and dissolves the underlying rock creating a porous network of caverns and throughways. Karst aquifers are known to be "extremely vulnerable to pollution" due to direct connection between the surface water and groundwater through both point (sinkholes) and diffuse (everywhere) infiltration. It is known from the Voluntary Remediation Plan of Jefferson Orchard that the groundwater at the subject site is only 60 feet below the ground. The subject property and much of the property around it are on an upland plain with few surface streams, but great seasonal variability in the water table resulting in numerous esteves and large amounts of water in the epikarst. This water is easily contaminated and this contamination spreads quickly throughout the aquifer. Dye tests performed near the subject site by the USGS have demonstrated this quick moving thorough dispersment in the aquifer in this area. While this contamination goes on to affect springs at the margins of the upland area continuing on in streams that service municipal water sources and the Potomac River, our concerns are far more immediate in both time and distance. Well water is the only water source available in the area of the proposed zoning change and, with the exception of Fox Glen, a majority of this water is supplied by private wells. Therefore, the groundwater aquifer fulfills a critical necessity, fulfilling all needs including human consumption, household uses, and agriculture and

maintenance of livestock and horses in the immediate area around the site. The concern is that if the aquifer becomes contaminated, then the local drinking water will be fouled.

For decades now, policy makers have been using “Aquifer Vulnerability,” to set land use and water resource protection policy. Karst has very high Aquifer Vulnerability. Therefore, this industrial use is not appropriate for this land and it should not be zoned for it. The guiding documents of the WVDEP recognize this. The introduction to the WVDEP document Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.”

The Chesapeake Bay Stormwater Network karst stormwater guidance document the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed, which the WVDEP cites in its own guiding document Stormwater Management Design in Karst Areas, clearly agrees stating:

“First, the effect of land development on karst terrain is complex and hard to predict, and requires professional analysis to reduce the risk of geological hazards, damage to infrastructure and groundwater contamination.” “The working group acknowledges that past approaches to stormwater and land development in karst terrain have been inadequate to safeguard the public and the environment.” “...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” We clearly need stronger comprehensive land use plans and zoning that direct new growth away from karst areas to more appropriate locations. Ordinance #2017-302 is literally the opposite of this.

Further, we cannot rely on the WVDEP to do the job that good local land use guidelines and zoning should do. For example, the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed states that detention and retention ponds are not recommended on karst and categorize them as discouraged. Also, quoting WVDEP’s own karst guidance: “attenuating surface runoff will increase the rate of sinkhole formation and potential groundwater contamination.” Yet the entity currently planning to utilize this zoning change is planning employment of multiple massive retention ponds and attenuating surface runoff completely. This has already been approved by the DEP in two Construction Stormwater General Permit registrations for that company. One of detention ponds is not even regulated by the DEP as it contains process water and has no outlet. Clearly the DEP recognizes the risks but is not appropriately limiting them. Relying on the DEP to protect the public health, safety, welfare, and the environment from any entity in these karst locations is simply as the CNS bulletin said it “inadequate to safeguard the public and the environment.” We must have appropriate zoning that takes into consideration appropriate use of land with karst hydrogeology. Ordinance #2017-302 does not do this, but instead increases the risk to the public and the environment.

A second serious concern is the air emissions from the industry that this zoning will provide for. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. These types of air emissions have been shown to increase the risk of, contribute to, and exacerbate a multitude of developmental, physical, physiological, physiological, cognitive and economic. The exposure of one individual can cause repercussions in multiple generations. Embryos, fetuses, and children are most vulnerable with effects born out over a lifetime, and that of their offspring. Many of these effects only require short-term exposure and some have even been shown to occur at levels below current limits recommended by the World Health Organization. One example of this is that a recent study found that “Even within the limits set by the World Health Organization, the pollutants PM₁₀, SO₂, NO₂, and O₃ are associated with increased risk of treatment for respiratory diseases in children 0 to 6 years of age.” Unfortunately, the US limits are higher than WHO, 300 % higher in the case of PM₁₀!

In fact, in 2019, in the Advice from the Independent Particulate Matter Review Panel (formerly U.S. EPA Clean Air Scientific Advisory Committee Particulate Matter Review Panel) on EPA’s Policy Assessment for the Review of the National Ambient Air Quality Standards for Particulate Matter, it stated that the committee unanimously and unequivocally found that the current primary annual and 24-hour PM_{2.5} National Ambient Air Quality Standards (NAAQS) are not adequate to protect public health. The advice from this 20-member committee, whose scientific disciplines include epidemiology, medicine, toxicology, air quality measurement, air quality modeling, exposure assessment measurement and modeling, risk assessment, statistics, and others, was ignored due presumably to political pressure. Not only are the NAAQS too high in some cases, but due to the measure and mechanism by which they work, they can not replace the safety provided by good land use and zoning regulations, that are meant to do things like keep factories with air emissions and hundreds of heavy trucks away from elementary schools. In fact, there is a state law that prohibits siting a school near a factory. Unfortunately, the reciprocal law does not exist. Clearly, just like with the water resources, we cannot rely on the DEP or the EPA to do the job of what appropriate zoning should do. The whole point of zoning is to keep people safe and provide for their health and welfare. Ordinance #2017-302 puts families and school children directly in harms way.

The air emissions, threat to the groundwater, and the very presence of the industry that this zoning change will allow for will have a serious negative economic effect on those who live and or work closest to the site in question. Productivity and workforce participation will be negatively affected by the health effects of the air emissions. The local agricultural operations will be negatively affected by the air emissions with lower quantity and quality of crop yield and would be devastated if the ground water aquifer were fouled. The equine operations in the area, of which there are several, will be negatively affected by the air emissions as they affect the horses’ health and performance. The mere presence of the industry that will be provided for by this zoning change will cause property values to fall. There will be serious economic consequences for the immediate area around the site in question.

Several of the communities in the immediate area of the site for proposed zoning change are traditionally underserved and have lower economic status. The choice of this location for such a zoning change represents an egregious example of environmental injustice that should not be promulgated or tolerated.

This zoning change will provide for industry that will negatively affect the health safety and welfare of our community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Margaret McDonagh

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Janet Riner

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on #2017-302. The air emissions, possibility of ground and surface water contamination, and their effect on our interwoven economies threaten the health, safety and welfare of not just Jefferson County but the greater region, including Loudoun and the greater Northern Virginia area.

This zoning would provide for industry that produces large amounts of air emissions. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. Northern Virginia is directly downwind from these emissions. Much of the gaseous, fine particulate, and hazardous emissions can reach Northern Virginia. Further affecting the outdoor air quality of the adjacent portion of Virginia and the ability of these areas to achieve and maintain National Ambient Air Quality Standards (NAAQS) attainment. This will affect agriculture and outdoor leisure and recreation.

For example, Loudoun County has been in nonattainment for the NAAQS 8-hour Ozone standard for the past two years. VOC and NO_x react after they have been emitted to produce ground level ozone. The industry that this rezoning would provide for would produce large amounts of these emissions. This would make it even harder as Loudoun County tries to achieve attainment. As time goes on and the scientific research advances our knowledge and understanding of the extent to which gaseous, particulate and hazardous emissions affect human health the NAAQS standards are likely to be reduced. The effects on air emission from this rezoning will make it only harder for Loudoun and Northern Virginia to meet these standards.

In addition to the concerns about the air, the possible ground and surface water contamination is very concerning to Loudoun and Virginia residents. The site is known to have ground water that is vulnerable to contamination due to the karst hydrogeology. A USGS study demonstrated that the ground water adjacent to the site to be rezoned communicates readily with surface

water tributaries of the Potomac River. In addition to direct infiltration where water moves directly from the surface to groundwater via porous limestone bedrock, karst is known to have severe ground instability problems. This makes karst geology prone to sinkhole development. Sinkholes provide direct connection between the surface water and any contaminants it may contain and the groundwater. This makes the aquifer vulnerability in karst areas very high, and contamination with industrial activity such as that provided for by this rezoning too likely. In this way, this zoning change will adversely affect the health and welfare of individuals and the community.

Loudoun sources its drinking water from the Potomac River, downstream of many West Virginia tributaries that carry water from the epikarst and groundwater aquifer at the site to be rezoned. Loudoun has recently completed the new Trap Rock Water Treatment facility, which draws water from the Potomac River. Loudoun currently provides 40 million gallons and projects to provide 90 million gallons of drinking water a day to customers by 2040 (Loudounwater.org). Therefore, the viability of the Potomac River is a high priority for Virginia residents.

Loudoun and Northern Virginia is one of the fastest growing communities in the country and provides a lot to Jefferson County in their symbiotic relationship. Virginia residents support and enjoy Jefferson County through tourism, as our residents enjoy the natural and historical resources of your county. Virginia residents and businesses support the equine industry in a multitude of ways from providing wagering fans at the races to the Virginia Breeders Association Virginia Certified incentive programs and a strong market for retired racehorses. According to an economic impact study from WVU, at least 40% of Jefferson County residents travel outside of West Virginia for work, a good percentage of those travel to northern Virginia. This rezoning would allow for industry that would negatively affect the economy of both places and this relationship and the benefits for our residents gleaned from it.

This zoning change will provide for industry that will negatively effect the health safety and welfare of the Loudoun and Northern Virginia community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Janet Boyd

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask you to vote NO on Ordinance #2017-302. The industry this zoning change will allow for endangers the health, safety and, welfare of the community, and violates the premise of the smart code zoning that we have spent so much time, effort and federal money employing.

Any change in zoning needs to align with the comprehensive plan. In Ranson's current comprehensive plan (2012), the city only refers to "heavy industry" in the history section. Here it is characterized as part of a bygone era that has been replaced by an emphasis on agriculture for local food production, open spaces, and quality-of-life. In the remainder of the document, the word industry is used loosely to describe businesses including flower shops and shoe stores. Nothing that resembles the industry that this zoning change will provide for is described in the current comprehensive plan of Ranson.

In the land use section of the comprehensive plan, number ten states:

"Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The comprehensive plan clearly states that the city will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community. This change in zoning clearly negatively affects the health, safety, and welfare of the community.

As the zoning is proposed, the industry that this zoning change will allow for will be directly across the street from houses, parks and other small businesses. A densely populated subdivision and an elementary school already exit directly across the street. While these latter

community sections are not in the city limits, the effect of this zoning on them should still be considered just the same as it would be if they were in the city limits.

The industry that this zoning change will provide for will produce particulate, gaseous, and hazardous air emissions. These emissions have been shown to be detrimental to human health at every stage of life from embryo to old age. In utero and childhood exposure are the most damaging with lasting effects being realized through out life, and with maternal exposure the effects can be felt for generations. Multiple organ systems are affected including respiratory, cardiovascular, neurologic, immune, and endocrine causing defects in multiple processes including in utero development, neurodevelopment, immune and tolerance development, and cognitive defects. There are also psychological, social, and economic effects from both perceived and actual air pollution in both children and adults. Many of these effects can be seen even with short-term exposure or exposure that is lower than the levels recommended by the US Environmental Protection Agency and World Health Organization. These consequences are devastating to the individual and depressing to the local community and economy. State law does not allow a school to be built next to industry that this zoning will allow but yet we are contemplating changing the zoning so this industry can build next to a school. This does not make sense. As Ranson residents, we want Ranson to follow the lead of the state and keep polluting industry away from kids. In these ways, this change in zoning will negatively affect the health and welfare of the community.

In addition to the health effects of the air emissions is the threat to groundwater from the industry that this zoning change would allow. The land in question has karst hydrogeology and therefore very high aquifer vulnerability and is not appropriate for this industry. With the type of industry this zoning will provide for, combined with high aquifer vulnerability, the likelihood of groundwater contamination is too high for the community and region to bear. A USGS study demonstrated that contamination in the groundwater adjacent to the site moves relatively quickly and can be found in wells and surface water structures in a variety of locations in the County. In this way, contamination at the site would affect the drinking water of the great majority of Jefferson County residents. Through the surface water connections, the water at the site also affects the water resources of the region.

Aquifer vulnerability has been used by policy makers for decades to set land use regulations. The guiding document, from the WVDEP, Stormwater Management Design in Karst Areas states, "it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." In Ranson, we need to follow this advice and not change the zoning of this land for use by industry that has among the highest aquifer vulnerability in the County. This zoning change will endanger the safety of the community and region by endangering the safe water resources. As Ranson residents, we want to safeguard the water resources of the county and region by following the WVDEP guidance here.

Further, by reallocating this transect district and replacing it with a monolithic block of Special District Industrial designation, hundreds of housing units, parks and space for small businesses are lost. Ranson loses the potential for property tax on these properties and their improvements, Business and Occupational tax on the businesses and sales tax in retail stores. The community loses out on the opportunity to develop affordable housing and create locations where people can live, work, play, and shop all in the same place reducing the need for travel.

Worse yet apparently a deal has been made where the entity that owns the subject land has required that a litany of things not be built on the adjacent land essentially stripping the purpose of the smart code transect zone that exists there. Transect zones in the smart code are meant to transition, from out to in, and provide communities where people can safely work and live in close proximity in an effort to reduce travel. Excluding many of the components of the transect zone effectively eliminates the features that make it a transect zone, thus, losing the benefits a transect zone offers the community and city. By losing these benefits, reducing the overall and affordable housing prospects, and reducing so drastically the opportunities for city income, this zoning change will negatively affect the welfare of the community.

As Ranson residents, we find it odd that we are changing zoning to provide for industry that we would not put in the middle of our town close to our residents, but we are placing it close to the homes of county residents. Further, it is striking that the area where this change in zoning is directly adjacent to historically underserved lower income communities and a Title I school. This amounts to environmental injustice and cannot be tolerated.

The purpose of zoning is for a city to protect the health, welfare, morals and safety of the community. In this case, the air emissions and heavy truck traffic will endanger the communities' health. The threat of water contamination will endanger the safety of the community. The effect of lost productivity and decreased workforce participation due to increased illness and the negative effect the air emissions and presence of such a factory will have on the local economy will negatively affect the welfare of the community. The environmental injustice of changing the zoning to accommodate such polluting industry in a location where your municipality has no residents, but yet hundreds of low income and underserved county residents live is egregiously amoral. This must not happen. We respectfully implore you to do the right thing and vote no on ordinance #2017-302.

Sincerely,

Elizabeth Jones

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please do the right thing and vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Beyond the obvious, city officials, planning officials, and politicians were LIED TO and MISLEAD by Rockwool. Our county is BEAUTIFUL, and can grow safely and efficiently without light or heavy industry. We need community based businesses. Businesses that benefit residents and tourists alike. Residents have stayed for decades, and many younger adults flock to this county for its beauty, peacefulness, and small town feel, all while being close to our nations capital. Please do the right thing and preserve our beautiful skyline, please keep it free from industrial smokestacks, and keep our air and water free of VOC's along with tons upon tons, of other harmful pollutants and known carcinogens.

Sincerely,

Carrie M Jenkins

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote NO on Ordinance #2017-302. This rezoning will put an undue hardship on the wastewater treatment systems, burden the rate payers and risk surface waterways in Charles Town, risking the health, safety and welfare of the community. The comprehensive plan of Ranson states, the City "will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community." Therefore, please vote NO on #2017-302.

The nature of the industry that this zoning will allow will be harmful to our local economy. Charles Town has spent a lot of time and money improving our downtown area for restaurants and retail. We are working to take advantage of the tourism industry in our county and bring more people into Charles Town. The eye sore, noise pollution, air pollution, and obvious move away from sustainability will drive people away from Jefferson County and Charles Town, rendering our efforts ineffective and unrewarding. This will make it harder for our small businesses to be successful. In this way, the industry this zoning will provide for will adversely affect the welfare of our community.

According to the 2018 WVU economic study of the eastern panhandle, over 40% of the workforce in Jefferson County choose to work outside of the state. These commuters bring that money home and spend it here supporting our local small businesses, economy and government. Charles Town has a large number of residents who commute. These typically higher earners may choose to leave the area because of the presence of the industry that this zoning change would provide for. This will cause a hardship on our economy and municipality. In this way, the industry this zoning will provide for will adversely affect the welfare of our community.

The industry that this zoning will allow will cause stress for multiple reasons on the Charles Town wastewater treatment systems and the surface waterways in Jefferson County and

beyond. The industry currently planning to utilize the zoning change will have discharge to the wastewater system that is high in chloride, primarily from its water softening system. The NPDES permit modification allows up to 5,000 mg/L. Chloride is not settled or removed at the wastewater treatment plant. It cannot be removed by conventional means and would be prohibitively expensive to do by new technology. This is of concern to Charles Town because chloride can harm stream water and also impair functioning of the wastewater treatment plant. Furthermore, the corrosive nature of chloride can cause damage to pipes both in the wastewater system and those used by downstream drinking water systems, like the \$207 million Trap Rock Water Treatment plant in Loudoun.

The human health criteria for chloride under WV standards is 250 mg/L. Under low stream flow conditions, chloride additions to the treatment plant effluent, as proposed by the industry currently planning to utilize the zoning change, could cause chloride levels in Evitts Run to exceed this standard. If the amount of chloride increased due to expansion or higher throughput, then this human health standard would be violated frequently. Chlorides are also known to harm aquatic life and effect metal toxicity in rivers. The USEPA and several states have surface water guidelines of 230mg/L for chronic exposure. This would also pose a risk of damaging the water treatment facilities downstream on the Potomac River.

A research study by Lefebvre and Moletta in 2006 showed that chloride and salinity impair the ability of wastewater treatment to remove phosphorus and nitrogen, and because of this, other states have introduced legislation to treat saline wastewater. Uygur and Kargi in 2004 looked at the effects of salt on synthetic wastewater treatment. They found that removal of both nitrogen and phosphorus was reduced when salinity increased from 0 to 6%. In fact, the removal efficiency of ammonia dropped from 96% to 39% with this increasing salinity. Hong et al. In 2016 found phosphorous removal decreased 20-28% when chloride concentrations went from 150 mg/L to 1,500 mg/L. Phosphorous removal was completely inhibited at concentrations greater than 2,500 mg/L. This increased salinity has the potential to make the Charles Town wastewater treatment system work far less efficiently.

In addition to the contents of the wastewater this type of industry will produce, the volume of sewage is itself a concern. Given that the City of Charles Town has been in violation of its permit on numerous occasions for spills and overflow of untreated sewage, adding large volumes of wastewater will further challenge the near capacity system. This will mean that costly capacity upgrades will need to be done likely sooner than they would have needed to be done, imposing further financial strain on the system. Through these effects, the industry this zoning will provide for will adversely effect the health, safety, and welfare of the community.

This zoning change will provide for industry the likes of which are not present in this county and have not been present in this county for many decades. We find it appalling that the introduction of zoning for such industry is being done in an area of the county that is historically underserved and lower income. It is even more egregious because the worst effects including air pollution and groundwater contamination will be felt first and most severely in the immediate vicinity, and Ranson does not even have residents in the immediate vicinity of the

proposed zoning change. This decision is being contemplated without representation of those who will be most affected. This would be a deplorable example of environmental injustice.

This zoning will provide for industry that will harm our economy, drive away residents, challenge and or damage our infrastructure, and may damage our waterways and wild life. Through these effects, the industry this zoning would allow will adversely effect the health, safety, and welfare of our community. This is being done with out representation of those it will affect the most. Please vote No on Ordinance #2017-302.

Sincerely,

Kurt Colson

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on #2017-302. The air emissions, possibility of ground and surface water contamination, and their effect on our interwoven economies threaten the health, safety and welfare of not just Jefferson County but the greater region, including Loudoun and the greater Northern Virginia area.

This zoning would provide for industry that produces large amounts of air emissions. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. Northern Virginia is directly downwind from these emissions. Much of the gaseous, fine particulate, and hazardous emissions can reach Northern Virginia. Further affecting the outdoor air quality of the adjacent portion of Virginia and the ability of these areas to achieve and maintain National Ambient Air Quality Standards (NAAQS) attainment. This will affect agriculture and outdoor leisure and recreation.

For example, Loudoun County has been in nonattainment for the NAAQS 8-hour Ozone standard for the past two years. VOC and NO_x react after they have been emitted to produce ground level ozone. The industry that this rezoning would provide for would produce large amounts of these emissions. This would make it even harder as Loudoun County tries to achieve attainment. As time goes on and the scientific research advances our knowledge and understanding of the extent to which gaseous, particulate and hazardous emissions affect human health the NAAQS standards are likely to be reduced. The effects on air emission from this rezoning will make it only harder for Loudoun and Northern Virginia to meet these standards.

In addition to the concerns about the air, the possible ground and surface water contamination is very concerning to Loudoun and Virginia residents. The site is known to have ground water that is vulnerable to contamination due to the karst hydrogeology. A USGS study demonstrated that the ground water adjacent to the site to be rezoned communicates readily with surface

water tributaries of the Potomac River. In addition to direct infiltration where water moves directly from the surface to groundwater via porous limestone bedrock, karst is known to have severe ground instability problems. This makes karst geology prone to sinkhole development. Sinkholes provide direct connection between the surface water and any contaminants it may contain and the groundwater. This makes the aquifer vulnerability in karst areas very high, and contamination with industrial activity such as that provided for by this rezoning too likely. In this way, this zoning change will adversely affect the health and welfare of individuals and the community.

Loudoun sources its drinking water from the Potomac River, downstream of many West Virginia tributaries that carry water from the epikarst and groundwater aquifer at the site to be rezoned. Loudoun has recently completed the new Trap Rock Water Treatment facility, which draws water from the Potomac River. Loudoun currently provides 40 million gallons and projects to provide 90 million gallons of drinking water a day to customers by 2040 (Loudounwater.org). Therefore, the viability of the Potomac River is a high priority for Virginia residents.

Loudoun and Northern Virginia is one of the fastest growing communities in the country and provides a lot to Jefferson County in their symbiotic relationship. Virginia residents support and enjoy Jefferson County through tourism, as our residents enjoy the natural and historical resources of your county. Virginia residents and businesses support the equine industry in a multitude of ways from providing wagering fans at the races to the Virginia Breeders Association Virginia Certified incentive programs and a strong market for retired racehorses. According to an economic impact study from WVU, at least 40% of Jefferson County residents travel outside of West Virginia for work, a good percentage of those travel to northern Virginia. This rezoning would allow for industry that would negatively affect the economy of both places and this relationship and the benefits for our residents gleaned from it.

This zoning change will provide for industry that will negatively effect the health safety and welfare of the Loudon and Northern Virginia community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Joseph Hafner

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask you to vote NO on Ordinance #2017-302. The industry this zoning change will allow for endangers the health, safety and, welfare of the community, and violates the premise of the smart code zoning that we have spent so much time, effort and federal money employing.

Any change in zoning needs to align with the comprehensive plan. In Ranson's current comprehensive plan (2012), the city only refers to "heavy industry" in the history section. Here it is characterized as part of a bygone era that has been replaced by an emphasis on agriculture for local food production, open spaces, and quality-of-life. In the remainder of the document, the word industry is used loosely to describe businesses including flower shops and shoe stores. Nothing that resembles the industry that this zoning change will provide for is described in the current comprehensive plan of Ranson.

In the land use section of the comprehensive plan, number ten states:

"Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The comprehensive plan clearly states that the city will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community. This change in zoning clearly negatively affects the health, safety, and welfare of the community.

As the zoning is proposed, the industry that this zoning change will allow for will be directly across the street from houses, parks and other small businesses. A densely populated subdivision and an elementary school already exit directly across the street. While these latter

community sections are not in the city limits, the effect of this zoning on them should still be considered just the same as it would be if they were in the city limits.

The industry that this zoning change will provide for will produce particulate, gaseous, and hazardous air emissions. These emissions have been shown to be detrimental to human health at every stage of life from embryo to old age. In utero and childhood exposure are the most damaging with lasting effects being realized through out life, and with maternal exposure the effects can be felt for generations. Multiple organ systems are affected including respiratory, cardiovascular, neurologic, immune, and endocrine causing defects in multiple processes including in utero development, neurodevelopment, immune and tolerance development, and cognitive defects. There are also psychological, social, and economic effects from both perceived and actual air pollution in both children and adults. Many of these effects can be seen even with short-term exposure or exposure that is lower than the levels recommended by the US Environmental Protection Agency and World Health Organization. These consequences are devastating to the individual and depressing to the local community and economy. State law does not allow a school to be built next to industry that this zoning will allow but yet we are contemplating changing the zoning so this industry can build next to a school. This does not make sense. As Ranson residents, we want Ranson to follow the lead of the state and keep polluting industry away from kids. In these ways, this change in zoning will negatively affect the health and welfare of the community.

In addition to the health effects of the air emissions is the threat to groundwater from the industry that this zoning change would allow. The land in question has karst hydrogeology and therefore very high aquifer vulnerability and is not appropriate for this industry. With the type of industry this zoning will provide for, combined with high aquifer vulnerability, the likelihood of groundwater contamination is too high for the community and region to bear. A USGS study demonstrated that contamination in the groundwater adjacent to the site moves relatively quickly and can be found in wells and surface water structures in a variety of locations in the County. In this way, contamination at the site would affect the drinking water of the great majority of Jefferson County residents. Through the surface water connections, the water at the site also affects the water resources of the region.

Aquifer vulnerability has been used by policy makers for decades to set land use regulations. The guiding document, from the WVDEP, Stormwater Management Design in Karst Areas states, "it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." In Ranson, we need to follow this advice and not change the zoning of this land for use by industry that has among the highest aquifer vulnerability in the County. This zoning change will endanger the safety of the community and region by endangering the safe water resources. As Ranson residents, we want to safeguard the water resources of the county and region by following the WVDEP guidance here.

Further, by reallocating this transect district and replacing it with a monolithic block of Special District Industrial designation, hundreds of housing units, parks and space for small businesses are lost. Ranson loses the potential for property tax on these properties and their improvements, Business and Occupational tax on the businesses and sales tax in retail stores. The community loses out on the opportunity to develop affordable housing and create locations where people can live, work, play, and shop all in the same place reducing the need for travel.

Worse yet apparently a deal has been made where the entity that owns the subject land has required that a litany of things not be built on the adjacent land essentially stripping the purpose of the smart code transect zone that exists there. Transect zones in the smart code are meant to transition, from out to in, and provide communities where people can safely work and live in close proximity in an effort to reduce travel. Excluding many of the components of the transect zone effectively eliminates the features that make it a transect zone, thus, losing the benefits a transect zone offers the community and city. By losing these benefits, reducing the overall and affordable housing prospects, and reducing so drastically the opportunities for city income, this zoning change will negatively affect the welfare of the community.

As Ranson residents, we find it odd that we are changing zoning to provide for industry that we would not put in the middle of our town close to our residents, but we are placing it close to the homes of county residents. Further, it is striking that the area where this change in zoning is directly adjacent to historically underserved lower income communities and a Title I school. This amounts to environmental injustice and cannot be tolerated.

The purpose of zoning is for a city to protect the health, welfare, morals and safety of the community. In this case, the air emissions and heavy truck traffic will endanger the communities' health. The threat of water contamination will endanger the safety of the community. The effect of lost productivity and decreased workforce participation due to increased illness and the negative effect the air emissions and presence of such a factory will have on the local economy will negatively affect the welfare of the community. The environmental injustice of changing the zoning to accommodate such polluting industry in a location where your municipality has no residents, but yet hundreds of low income and underserved county residents live is egregiously amoral. This must not happen. We respectfully implore you to do the right thing and vote no on ordinance #2017-302.

Sincerely,

Kyle Meyer

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Robert Marshall

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that will significantly harm the municipalities within Jefferson County and beyond effecting the health, welfare, and safety of our community. I am extremely concerned about the effect of the air pollution that heavy industry will create in Jefferson County. This part of Jefferson County is in close proximity to two Title 1 schools. Heavy industry developed on this land will affect the health and well being of the school children, teachers, and staff, as well as the nearby residents. Additionally, I am particularly concerned about the development of industries known to emit toxic waste material being built on the predominantly karst geology of this section of Jefferson County. Karst geology is quite vulnerable to contamination from industrial runoffs or leakages. Such contamination is almost, if not impossible to remedy. Most of Jefferson County residents depend on well water. Contamination of our water supply will affect not only the drinking water (and thus the health) of our residents but also the health of the Potomac River and eventually that of the Chesapeake Bay.

Harpers Ferry is a national treasure with the natural and historic resources tours flock to see each year and one of the communities that will be negatively impacted by this zoning change. I personally cannot imagine anyone wanting to visit or live near a heavily industrial area with the various smoke stacks emitting carcinogenic chemicals and particulate matter (2.5 and 10). According to a 2019 study by the West Virginia Tourism Office, Jefferson County generated an average of \$178 million per year in tourism-derived revenue for state and local governments over the last 10 years, more than any other county in West Virginia by at least double. Tourism benefits the businesses and economy of Ranson and Jefferson County producing \$213.7 million in individual earning, 7040 jobs, and \$842.6 million in direct spending here in 2018. We would need 40 Project Shuttles to replace the individual earnings and 59 Rockwools to replace the jobs provided by the tourism industry in Jefferson County. It is important to note that most of the money generated by tourism in Jefferson County comes from neighboring states. In this way, it is like an export: not simply recycling money, but bringing money into the state

increasing its wealth. Much of the economy in Harpers Ferry is based on this tourism industry. A threat to this industry poses a threat to the economy and welfare of our community.

One of the important drivers for tourism in Harpers Ferry is the Appalachian Trail. According to the Appalachian Trail Conservancy (ATC), Harpers Ferry is the psychologic midpoint of the Trail, and hikers often plan extended stays in Jefferson County with an obvious positive impact. The ATC reports that the smokestacks and associated lights will be visible in the viewshed of 15 vistas on the Appalachian Trail (AT). Studies have shown that quality of vistas and human impact on the environment are not only noticed by visitors, but effect their experience. Another study published in the Journal of Applied Recreation Research, found that points of interests and views drew visitors' attention and had a significant impact on their perception of the trail. It was also found that particularly beautiful vistas helped visitors overlook elements that usually have a negative effect on trail experience like increased trail traffic. A 2009 study in Leisure Sciences revealed that scenic value was a perceptual theme of Appalachian Trail visitors, and that things as simple as dead trees visible in a vista can have a negative impact on visitors' overall perception. Imagine the effect the smokestacks will have from the 15 vistas from which they will be visible. The introduction of industrial activity made possible by the proposed rezoning in Ranson would have a negative effect on the scenic views of beautiful landscapes from the Appalachian Trail in Jefferson County.

The air pollution coming from the smoke stacks will create haze. The effect of regional haze on tourists was explored in a review article published in the Atmospheric Environment titled "Impaired visibility: the air pollution people see." A key takeaway on the negative affect of haze on vacationing tourists was summarized as follows:

"Vacations offer an escape from the routine and stress of our daily lives. Vacation destinations are often chosen based on their scenery; vacations are spent gazing at monuments, mountains, clouds, and oceans. Good visibility allows clear observation of distant features and appreciation of the inherent beauty of these scenes...Air pollution, which is often present in both our cities and parks, interferes with these attributes and can ruin the views vacationers travel to enjoy."

People seek bucolic, unspoiled areas to escape the stresses of urban areas. A 2004 study in Environment and Behavior found perceived pollution causes stress while viewing natural scenes has both psychological and physiological benefits, and a 2007 study confirmed these benefits. Two other studies found that people are emotionally affected by poor visibility, and tourists are disappointed when views are obscured by haze.

The combination of smokestacks and haze will mar the viewshed and will not only reduce the positive effects of a scenic landscape but also leave tourists disappointed and dissatisfied with their choice of destination. With these effects the welfare of the Harpers Ferry community would undoubtedly be endangered by the industry that this zoning change will provide for.

Multiple studies by doctors Kozar, Doctor, and Doctor have demonstrated that the land at this site to be rezoned is Karst with the highest likelihood of sinkhole development in the county,

and that the groundwater aquifer there is incredibly sensitive to contamination from surface water. Further, this site is on an upland plain with relatively few surface streams, seasonal variability in the water table that results in numerous estavelles, and large amounts of water in the epikarst. In this area contamination in surface water communicates easily to the water in the epikarst via diffuse and point infiltration, and the springs at the margins of the upland area are directly affected by the water quality throughout the aquifer. According to Jefferson Orchards Voluntary Remediation Plan with the WVDEP, the groundwater at the site is approximately 60 feet below the ground, and the tests performed by the USGS have shown that groundwater from just adjacent to this site emerged in the headwaters of both the Elk's Run and Rattlesnake Run. This is critically important for Harpers Ferry because the Elk's Run headwaters is a spring about three miles southeast of the site and goes on to become the drinking water source for Harpers Ferry and Bolivar before emptying into the Potomac River. The headwaters of Rattlesnake Run is a spring about 3.5 miles from the site and is also a tributary of the Potomac River. The Potomac River is the back up water source for Harpers Ferry. This means that the activity at the site will have a critical influence on the drinking water of Harpers Ferry. In this was the industry permitted by this change in zoning would undoubtedly endanger the health and safety of the community in Harpers Ferry.

The untoward health effects and individual economic consequences from the pollution emissions of the industry this rezoning will allow that will be born out over the length of people's lives and that of their decedents for at least three generations is an egregious example of environmental injustice that should not be tolerated. This zoning change may be in one of the poorest sections of the county, but the effects will be felt in every part of Ranson and the county.

The Comprehensive Plan in Ranson (2012) put forth a beautiful vision of enhancement for Ranson and Jefferson County as a whole -- a vision that would have created jobs and opportunities for Jefferson County residents and small business enterprises and would have preserved our agricultural heritage and farmland. Such a comprehensive vision would also have made Jefferson County more competitive among the neighboring counties and states for tourism.

The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." The industry that this rezoning will allow will jeopardize the health, safety and welfare of Ranson, Harpers Ferry and the whole county. Please stand up for the people of Ranson and all of Jefferson County and vote no on the ordinance #2017-302.

Sincerely,

Cathryn Polonchak

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City.

I live in Maryland across the Potomac River from Harpers Ferry. I'm very concerned about the pollution caused by two 213 ft high smokestacks that will be built on the property. I am directly downwind from those smokestacks and the pollutants from coal and other chemicals will rain down on me. Please do not rezone that area for heavy industrial use. A c treeommercial district or an area for warehouses would be more appropriate.

Thank you,

Daniel Kremnitzer

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Ellen Truiett

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on Ordinance #2017-302. Ranson's proposed zoning change presents a significant risk to the equine industry in Jefferson County and well beyond. The type of industry that would be allowed by the proposed zoning change in this location would jeopardize horse health, the ground water supply, and workforce productivity. This will cause immediate shrinkage and threaten the long-term viability of the equine industry in the county. In doing so, the industry this zoning change will allow for will adversely affect the health, safety, and welfare of our community.

The site of the proposed rezoning is less than six miles from Charles Town Races, with several breeding, training, and rehabilitation facilities between the two. The industry allowed by this rezoning would produce particulate, gaseous, and hazardous air emissions that would reach these sites. According to the WVDEP air permit, the Rockwool plant in Ranson is permitted to emit 250.87 tons of particulate matter per year into the air (1).

According to a recent study published in the journal of Veterinary Internal Medicine (2), horses are 15 times more sensitive to inhaled particulate matter than humans. Inhaled particulate matter can cause inflammation in horses' lungs that negatively affects performance. Inhaled particulate matter also contributes to the development of inflammatory airway disease (IAD) (3). IAD is a chronic airway disease that can affect horses long after their racing career is over. While there is little research on how other air pollutants affect horses, the effects of pollution on humans can be used to infer potential impact on horses. However unlike human models, these horses are elite athletes continuously exposed, and will thus likely experience detrimental effects at much lower levels of air pollution than humans.

The primary concern with air pollution is that increased levels of pollutants will increase inflammation in horses' lungs. Even small, subclinical amounts of inflammation in the lungs of horses negatively affect performance (2,3,4,5,6,11). This inflammation can also cause increased

recovery times following racing (7,11). Reduced performance and training interruptions can lead to higher risk of injury, reduced winning average, fewer yearly starts, lower yearly earnings, shortened career length, fewer lifetime starts, reduced lifetime earnings, and reduced quality of life (2,3,8,9,11). Each of these situations will lead to decreased return on investment, decreased cash flow, and decreased overall earnings for owners, trainers, and breeders with horses at Charles Town Races and in nearby areas. In this way, the industry this zoning will allow will adversely affect the welfare of our community.

While racing is usually a thoroughbred's first career, it is rarely their last. Some racing horses go on to be breeding stock, while others will have successful careers as sport horses. Jefferson County is an important source of new stock for sport horse trainers from Northern Virginia, and Maryland, and this is a resource for local horseman of both income and placement for horses not appropriate for breeding. However, if retired racehorses are unsound from injury or respiratory disease, they can be difficult to manage as breeding stock or unfit for a career as a sport horse. This affects the horse's quality of life and also places a burden on the industry locally and regionally. In this way, the industry this zoning will provide for will adversely affect the welfare of our community.

The perception of decreased air quality from the increase in regional haze and visible smokestacks as one drives into the county will deter out of state Owners and Breeders from investing in West Virginia bred Race horses, decreasing or eliminating a critical \$50 million a year source of local business volume. In this way, the industry this zoning will provide for will adversely affect the welfare of our community.

Another concern related to the proposed rezoning in Ranson is the risk of groundwater contamination as a result of the karst hydrogeology at the site and the industrial activity. Horsemen will either have to take on the expense of periodically testing water sources or they may not know local ground water is contaminated until their animals are sick. Veterinary care and testing adds expense and uncertainty to an industry that already deals with large inherent risks. The actual occurrence of ground water contamination would be devastating for Jefferson County's equine industry. For both geographic and financial reasons, it is simply impossible to think that the industry could solely use public or private utility-provided water if industrial activity fouled the local groundwater. In this way, the industry this zoning will provide for will adversely affect the health, safety, and welfare of our community.

Finally, studies on US agricultural workers have demonstrated that increased air pollution decreases productivity of outdoors workers. This would place an additional burden on workers, small business owners and the industry. In this way the industry this zoning will provide for will adversely affect the health, safety, and welfare of our community.

The equine industry in Jefferson County is hundreds of years old. It is not worth risking this historic and economically valuable industry by rezoning for industrial companies like Rockwool. An economic impact study of the Charles Town Thoroughbred Horse Racing Industry on Jefferson County's economy found that the spending by owners, breeders, and trainers of the

equine industry directly contributes \$79.4 million to the county each year. Out-of-state owners, breeders, and trainers spend more than \$50 million in Jefferson County every year. The value of total business volume in Jefferson County is \$191 million each year (10). These numbers do not include the effect of the handle or the casino.

The equine industry provides jobs for a broad cross-section of the public. This industry offers individuals of any educational background a variety of paths to achieve a good middle-income living. Many jobs allow individuals to pursue apprenticeships or on-the-job training rather than requiring a costly college education. This flexibility allows for greater lifetime earnings and improved educational debt-to-earnings ratio for these workers. The equine industry also provides opportunities for non-traditional workers by offering job opportunities to those who may not be employable by larger corporations. This industry provides a variety of fulltime, part-time, flexible, and pick-up work. Encouraging this type of flexible job ecosystem helps create a healthy economy with broad participation in employment and consumption.

The equine industry is a large conglomerate of small businesses, which have a multitude of economic benefits over having a few large businesses. It has been extensively reported that small locally owned businesses and start ups create more jobs, cultivate innovation, generate higher incomes, and provide more opportunities for individuals that would otherwise not exist than big non-local firms, which can actually depress local economies. The equine industry provides opportunities for small businesses and startups responsible for this growth of better jobs that are so good for the economy.

The equine industry offers so many other benefits that the industry in the rezoned area would not. For example, the equine industry supports local agriculture by providing a market for agricultural goods such as straw. The robust straw market supported by owners, trainers, and breeders allows for a third cash crop to be produced from one field in a year. Through pastureland and support of local agricultural goods, the equine industry protects and preserves the open spaces that give our county its bucolic quality and help attract tourists. Through the breeders' incentive programs, the equine industry offers unique opportunities to draft state funds back to Jefferson County, to name a few.

Rezoning this area of Ranson for Special District Industrial will allow in entities whose activities are harmful to the equine industry. The losses incurred by the equine industry would far outweigh any benefits derived from industries occupying the rezoned area. Sacrificing the long-term viability of one of our oldest and most productive industries for a net loss in business volume and economic value just does not make good sense for the local economy. This zoning change would provide for industry that would adversely affect the health, safety and welfare of our communities. Please vote NO on Ordinance #2017-302.

Sincerely,

Laura Giani

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask that you vote no on Ordinance #2017-302. While I do not live in Ranson, I do live on property 1.77 miles away from the factory. I am concerned the land and homes around the property that is the subject of the zoning change are closer to the property than anyone who currently lives within the city limits of Ranson. This factory and the rezoning of the property will impact my property values. This area will be affected sooner and more harshly by the environmental issues that will develop secondary to the inappropriate siting of industry this zoning would allow.

The subject land has been well studied by Drs. Kozar, Doctor and Doctor and described in the scientific literature and USGS reports as having karst hydrology with very high aquifer vulnerability. The karst landscape is a consequence of the presence of soluble bedrock, which consists of limestone in the case of the subject land. In such landscapes water percolates through the ground and dissolves the underlying rock creating a porous network of caverns and throughways. Karst aquifers are known to be "extremely vulnerable to pollution" due to direct connection between the surface water and groundwater through both point (sinkholes) and diffuse (everywhere) infiltration. It is known from the Voluntary Remediation Plan of Jefferson Orchard that the groundwater at the subject site is only 60 feet below the ground. The subject property and much of the property around it are on an upland plain with few surface streams, but great seasonal variability in the water table resulting in numerous esteves and large amounts of water in the epikarst. This water is easily contaminated and this contamination spreads quickly throughout the aquifer. Dye tests performed near the subject site by the USGS have demonstrated this quick moving thorough dispersment in the aquifer in this area. While this contamination goes on to affect springs at the margins of the upland area continuing on in streams that service municipal water sources and the Potomac River, our concerns are far more immediate in both time and distance. Well water is the only water source available in the area of the proposed zoning change and, with the exception of Fox Glen, a majority of this water is supplied by private wells. Therefore, the groundwater aquifer fulfills a critical necessity,

fulfilling all needs including human consumption, household uses, and agriculture and maintenance of livestock and horses in the immediate area around the site. The concern is that if the aquifer becomes contaminated, then the local drinking water will be fouled.

For decades now, policy makers have been using “Aquifer Vulnerability,” to set land use and water resource protection policy. Karst has very high Aquifer Vulnerability. Therefore, this industrial use is not appropriate for this land and it should not be zoned for it. The guiding documents of the WVDEP recognize this. The introduction to the WVDEP document Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.”

The Chesapeake Bay Stormwater Network karst stormwater guidance document the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed, which the WVDEP cites in its own guiding document Stormwater Management Design in Karst Areas, clearly agrees stating:

“First, the effect of land development on karst terrain is complex and hard to predict, and requires professional analysis to reduce the risk of geological hazards, damage to infrastructure and groundwater contamination.” “The working group acknowledges that past approaches to stormwater and land development in karst terrain have been inadequate to safeguard the public and the environment.” “...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” We clearly need stronger comprehensive land use plans and zoning that direct new growth away from karst areas to more appropriate locations. Ordinance #2017-302 is literally the opposite of this.

Further, we cannot rely on the WVDEP to do the job that good local land use guidelines and zoning should do. For example, the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed states that detention and retention ponds are not recommended on karst and categorize them as discouraged. Also, quoting WVDEP’s own karst guidance: “attenuating surface runoff will increase the rate of sinkhole formation and potential groundwater contamination.” Yet the entity currently planning to utilize this zoning change is planning employment of multiple massive retention ponds and attenuating surface runoff completely. This has already been approved by the DEP in two Construction Stormwater General Permit registrations for that company. One of detention ponds is not even regulated by the DEP as it contains process water and has no outlet. Clearly the DEP recognizes the risks but is not appropriately limiting them. Relying on the DEP to protect the public health, safety, welfare, and the environment from any entity in these karst locations is simply as the CNS bulletin said it “inadequate to safeguard the public and the environment.” We must have appropriate zoning that takes into consideration appropriate use of land with karst

hydrogeology. Ordinance #2017-302 does not do this, but instead increases the risk to the public and the environment.

A second serious concern is the air emissions from the industry that this zoning will provide for. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. These types of air emissions have been shown to increase the risk of, contribute to, and exacerbate a multitude of developmental, physical, physiological, physiological, cognitive and economic. The exposure of one individual can cause repercussions in multiple generations. Embryos, fetuses, and children are most vulnerable with effects born out over a lifetime, and that of their offspring. Many of these effects only require short-term exposure and some have even been shown to occur at levels below current limits recommended by the World Health Organization. One example of this is that a recent study found that “Even within the limits set by the World Health Organization, the pollutants PM₁₀, SO₂, NO₂, and O₃ are associated with increased risk of treatment for respiratory diseases in children 0 to 6 years of age.” Unfortunately, the US limits are higher than WHO, 300 % higher in the case of PM₁₀!

In fact, in 2019, in the Advice from the Independent Particulate Matter Review Panel (formerly U.S. EPA Clean Air Scientific Advisory Committee Particulate Matter Review Panel) on EPA’s Policy Assessment for the Review of the National Ambient Air Quality Standards for Particulate Matter, it stated that the committee unanimously and unequivocally found that the current primary annual and 24-hour PM_{2.5} National Ambient Air Quality Standards (NAAQS) are not adequate to protect public health. The advice from this 20-member committee, whose scientific disciplines include epidemiology, medicine, toxicology, air quality measurement, air quality modeling, exposure assessment measurement and modeling, risk assessment, statistics, and others, was ignored due presumably to political pressure. Not only are the NAAQS too high in some cases, but due to the measure and mechanism by which they work, they can not replace the safety provided by good land use and zoning regulations, that are meant to do things like keep factories with air emissions and hundreds of heavy trucks away from elementary schools. In fact, there is a state law that prohibits siting a school near a factory. Unfortunately, the reciprocal law does not exist. Clearly, just like with the water resources, we cannot rely on the DEP or the EPA to do the job of what appropriate zoning should do. The whole point of zoning is to keep people safe and provide for their health and welfare. Ordinance #2017-302 puts families and school children directly in harms way.

The air emissions, threat to the groundwater, and the very presence of the industry that this zoning change will allow for will have a serious negative economic effect on those who live and or work closest to the site in question. Productivity and workforce participation will be negatively affected by the health effects of the air emissions. The local agricultural operations will be negatively affected by the air emissions with lower quantity and quality of crop yield and would be devastated if the ground water aquifer were fouled. The equine operations in the area, of which there are several, will be negatively affected by the air emissions as they affect the horses’ health and performance. The mere presence of the industry that will be provided

for by this zoning change will cause property values to fall. There will be serious economic consequences for the immediate area around the site in question.

Several of the communities in the immediate area of the site for proposed zoning change are traditionally underserved and have lower economic status. The choice of this location for such a zoning change represents an egregious example of environmental injustice that should not be promulgated or tolerated.

This zoning change will provide for industry that will negatively affect the health safety and welfare of our community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Marion Hazel

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Angela Carr

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask you to vote NO on Ordinance #2017-302. The industry this zoning change will allow for endangers the health, safety and, welfare of the community, and violates the premise of the smart code zoning that we have spent so much time, effort and federal money employing.

This zoning change will provide for industry that will negatively affect the agriculture industry in Jefferson County and beyond. The combination of the air emissions and threat to the ground water resources could have devastating consequences for the agricultural community of Jefferson County.

The comprehensive plan of Ranson is clear: it states, "the City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community." This land is ill-suited for an industrial facility due to its location and hydrogeology. Further, the industry that this zoning change will allow for will adversely affect the health, safety, and welfare of the community through its affect on the agricultural industry.

The agriculture industry in Jefferson County is hundreds of years old and continues to serve our community well today. According to the economic impact study "A Shared Agenda for Growing West Virginia's Agricultural Economy, Prepared by Fourth Economy for West Virginia Department Of Agriculture West Virginia University Extension Service 2012," Jefferson County is the second highest producing county for crops sales, third highest for fruits and vegetables sales, and in the top 9 counties for sales of animals and animal products.

Agriculture, tourism and the equine industries work synergistically to have an outsized positive impact on the economy in Ranson and Jefferson County as a whole. Agriculture drives tourism by creating agro-tourism opportunities, preserving beautiful open spaces that contribute to the

bucolic nature of our county, and providing the locally produced agriculture goods many tourists are look for in our markets and restaurants. Agriculture also supports the equine industry by providing local products like hay and straw, helping maintain pasture land, co-supporting local dual-purpose retail stores, and helping recycle by products. Agriculture helps maintain the way of life that many those who choose to live in Jefferson County enjoy. Industrial manufacturing and industry this zoning will provide for could never achieve these things.

Local agriculture also provides a source of locally produced agricultural goods. It has become apparent with the current pandemic and health emergency. This became a supply chain crisis because as our supply chains have moved to be ever more lean and efficient they lack resiliency and agility. By having a local source of agricultural goods and food we add resiliency and agility into our own economy and community. The agricultural industry in Jefferson County provides this.

A plethora of scientific studies have shown that a variety of air pollutants produced by the type of industry this zoning change would provide for causes decreased yields of both quantity and quality for several of the crops important to Jefferson County including winter wheat and soybeans. Soybeans and wheat are two of the crops significantly affected and two of the most prevalent crops in Jefferson County. Lower crop yields harm the farms and all the members of the down stream supply chain as well as the consumer. In this way, this zoning change will adversely affect the welfare of the community.

Recent studies have shown that even small increases in air pollution affect the productivity of agricultural workers. Similar to the reduction in crop yield this will negatively affect the individual workers, businesses, consumers and industry as a whole. In this way, this zoning change will adversely affect the health and welfare of individuals and the community.

Even more devastating is the possibility of groundwater contamination. The land at the subject location has karst hydrogeology and as such has porous bedrock and severe ground instability problems. The porous bedrock allows rapid diffuse infiltration of surface water into ground water and the severe ground instability problems leads to sinkhole development. Sinkholes provide direct connection of the surface water with the ground water aquifer through point infiltration. In fact, according to a 2012 study by Doctor and Doctor, the subject location and that of Terrapins Neck have the highest sinkhole vulnerability of any sites in Jefferson County. The propensity and easy of diffuse and point infiltration in areas of karst hydrogeology give them very high aquifer vulnerability meaning the aquifer is very vulnerable to contamination. For this reason, this measure has been used for decades by policymakers to set land use regulations. In this way, this zoning change and the industry it will provide for will adversely affect the welfare of the community.

The WVDEP recognizes development in car karst areas puts water resources high-risk for contamination but also recognizes that this is best protected against true local land use and zoning ordinances. WVDEP's guiding document Stormwater Management Design in Karst Areas

states, "it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." This document also references the Chesapeake Bay Stormwater Network karst stormwater guidance document the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed. In which it states "...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." Land use policy in Ranson and zoning need to take aquifer vulnerability into consideration as these agencies and documents suggest.

The Jefferson Orchards Voluntary Remediation Plan application reports that the ground water is only 60 feet from the surface at the site. It is described in the scientific literature that this land is an upland plane with large amounts of water in the epikarst, and contamination of this water effects the whole aquifer including the communications with surface water streams. A USGS study demonstrated that the groundwater adjacent to the site communicates readily with several surface water structures and wells miles away from the site. The effects of contamination at this site would go well beyond Ranson fouling large portions of the ground water and surface water in Jefferson County.

Groundwater contamination at the site would have devastating effects on the Agricultural industry in Jefferson county. For geographic and economic reasons it is simply infeasible for the agricultural industry to rely on utility provided water. Based on the scientific literature the site being considered for rezoning is one of the areas of highest aquifer vulnerability in Jefferson County and is inappropriate for the industry that this zoning change will provide for. This land is clearly ill-suited for industrial use and should not be zoned for it.

By threatening the local agricultural industry, the industry that this zoning will provide for will threaten the health, safety, and welfare of the community, and this land is not well-suited for industrial use. The Comprehensive Plan in Ranson is clear the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Anastasia Kim

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that will significantly harm the municipalities within Jefferson County and beyond effecting the health, welfare, and safety of our community. Harpers Ferry is a national treasure with the natural and historic resources tours flock to see each year and one of the communities that will be negatively impacted by this zoning change.

According to a 2019 study by the West Virginia Tourism Office, Jefferson County generated an average of \$178 million per year in tourism-derived revenue for state and local governments over the last 10 years, more than any other county in West Virginia by at least double. Tourism benefits the businesses and economy of Ranson and Jefferson County producing \$213.7 million in individual earning, 7040 jobs, and \$842.6 million in direct spending here in 2018. We would need 40 Project Shuttles to replace the individual earnings and 59 Rockwools to replace the jobs provided by the tourism industry in Jefferson County. It is important to note that most of the money generated by tourism in Jefferson County comes from neighboring states. In this way, it is like an export: not simply recycling money, but bringing money into the state increasing its wealth. Much of the economy in Harpers Ferry is based on this tourism industry. A threat to this industry poses a threat to the economy and welfare of our community.

One of the important drivers for tourism in Harpers Ferry is the Appalachian Trail. According to the Appalachian Trail Conservancy (ATC), Harpers Ferry is the psychologic midpoint of the Trail, and hikers often plan extended stays in Jefferson County with an obvious positive impact. The ATC reports that the smokestacks and associated lights will be visible in the viewshed of 15 vistas on the Appalachian Trail (AT). Studies have shown that quality of vistas and human impact on the environment are not only noticed by visitors, but effect their experience. Another study published in the Journal of Applied Recreation Research, found that points of interests and views drew visitors' attention and had a significant impact on their perception of the trail. It was also found that particularly beautiful vistas helped visitors overlook elements

that usually have a negative effect on trail experience like increased trail traffic. A 2009 study in Leisure Sciences revealed that scenic value was a perceptual theme of Appalachian Trail visitors, and that things as simple as dead trees visible in a vista can have a negative impact on visitors' overall perception. Imagine the effect the smokestacks will have from the 15 vistas from which they will be visible. The introduction of industrial activity made possible by the proposed rezoning in Ranson would have a negative effect on the scenic views of beautiful landscapes from the Appalachian Trail in Jefferson County.

The smokestacks are not all visitors will be able to see — the air pollution will create haze. The effect of regional haze on tourists was explored in a review article published in the Atmospheric Environment titled "Impaired visibility: the air pollution people see." A key takeaway on the negative affect of haze on vacationing tourists was summarized as follows:

"Vacations offer an escape from the routine and stress of our daily lives. Vacation destinations are often chosen based on their scenery; vacations are spent gazing at monuments, mountains, clouds, and oceans. Good visibility allows clear observation of distant features and appreciation of the inherent beauty of these scenes...Air pollution, which is often present in both our cities and parks, interferes with these attributes and can ruin the views vacationers travel to enjoy."

People seek bucolic, unspoiled areas to escape the stresses of urban areas. A 2004 study in Environment and Behavior found perceived pollution causes stress while viewing natural scenes has both psychological and physiological benefits, and a 2007 study confirmed these benefits. Two other studies found that people are emotionally affected by poor visibility, and tourists are disappointed when views are obscured by haze.

The combination of smokestacks and haze will mar the viewshed and will not only reduce the positive effects of a scenic landscape but also leave tourists disappointed and dissatisfied with their choice of destination. With these effects the welfare of the Harpers Ferry community would undoubtedly be endangered by the industry that this zoning change will provide for.

Multiple studies by doctors Kozar, Doctor, and Doctor have demonstrated that the land at this site to be rezoned is Karst with the highest likelihood of sinkhole development in the county, and that the groundwater aquifer there is incredibly sensitive to contamination from surface water. Further, this site is on an upland plain with relatively few surface streams, seasonal variability in the water table that results in numerous estavelles, and large amounts of water in the epikarst. In this area contamination in surface water communicates easily to the water in the epikarst via diffuse and point infiltration, and the springs at the margins of the upland area are directly affected by the water quality throughout the aquifer. According to Jefferson Orchards Voluntary Remediation Plan with the WVDEP, the groundwater at the site is approximately 60 feet below the ground, and the tests performed by the USGS have shown that groundwater from just adjacent to this site emerged in the headwaters of both the Elk's Run and Rattlesnake Run. This is critically important for Harpers Ferry because the Elk's Run headwaters is a spring about three miles southeast of the site and goes on to become the drinking water source for Harpers Ferry and Bolivar before emptying into the Potomac River.

The headwaters of Rattlesnake Run is a spring about 3.5 miles from the site and is also a tributary of the Potomac River. The Potomac River is the back up water source for Harpers Ferry. This means that the activity at the site will have a critical influence on the drinking water of Harpers Ferry. In this was the industry permitted by this change in zoning would undoubtedly endanger the health and safety of the community in Harpers Ferry.

The untoward health effects and individual economic consequences from the pollution emissions of the industry this rezoning will allow that will be born out over the length of people's lives and that of their decedents for at least three generations is an egregious example of environmental injustice that should not be tolerated. This zoning change may be in one of the poorest sections of the county, but the effects will be felt in every part of Ranson and the county.

The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." The industry that this rezoning will allow will jeopardize the health, safety and welfare of Ranson, Harpers Ferry and the whole county. Please vote no on the ordinance #2017-302.

Sincerely,

Pamela Bush

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask that you vote no on Ordinance #2017-302. While not in Ranson, the land and homes around the property that is the subject of the zoning change are closer to the property than anyone who currently lives within the city limits of Ranson. This area will be affected sooner and more harshly by the environmental issues that will develop secondary to the inappropriate siting of industry this zoning would allow.

The subject land has been well studied by Drs. Kozar, Doctor and Doctor and described in the scientific literature and USGS reports as having karst hydrology with very high aquifer vulnerability. The karst landscape is a consequence of the presence of soluble bedrock, which consists of limestone in the case of the subject land. In such landscapes water percolates through the ground and dissolves the underlying rock creating a porous network of caverns and throughways. Karst aquifers are known to be "extremely vulnerable to pollution" due to direct connection between the surface water and groundwater through both point (sinkholes) and diffuse (everywhere) infiltration. It is known from the Voluntary Remediation Plan of Jefferson Orchard that the groundwater at the subject site is only 60 feet below the ground. The subject property and much of the property around it are on an upland plain with few surface streams, but great seasonal variability in the water table resulting in numerous esteves and large amounts of water in the epikarst. This water is easily contaminated and this contamination spreads quickly throughout the aquifer. Dye tests performed near the subject site by the USGS have demonstrated this quick moving thorough dispersment in the aquifer in this area. While this contamination goes on to affect springs at the margins of the upland area continuing on in streams that service municipal water sources and the Potomac River, our concerns are far more immediate in both time and distance. Well water is the only water source available in the area of the proposed zoning change and, with the exception of Fox Glen, a majority of this water is supplied by private wells. Therefore, the groundwater aquifer fulfills a critical necessity, fulfilling all needs including human consumption, household uses, and agriculture and

maintenance of livestock and horses in the immediate area around the site. The concern is that if the aquifer becomes contaminated, then the local drinking water will be fouled.

For decades now, policy makers have been using “Aquifer Vulnerability,” to set land use and water resource protection policy. Karst has very high Aquifer Vulnerability. Therefore, this industrial use is not appropriate for this land and it should not be zoned for it. The guiding documents of the WVDEP recognize this. The introduction to the WVDEP document Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.”

The Chesapeake Bay Stormwater Network karst stormwater guidance document the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed, which the WVDEP cites in its own guiding document Stormwater Management Design in Karst Areas, clearly agrees stating:

“First, the effect of land development on karst terrain is complex and hard to predict, and requires professional analysis to reduce the risk of geological hazards, damage to infrastructure and groundwater contamination.” “The working group acknowledges that past approaches to stormwater and land development in karst terrain have been inadequate to safeguard the public and the environment.” “...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” We clearly need stronger comprehensive land use plans and zoning that direct new growth away from karst areas to more appropriate locations. Ordinance #2017-302 is literally the opposite of this.

Further, we cannot rely on the WVDEP to do the job that good local land use guidelines and zoning should do. For example, the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed states that detention and retention ponds are not recommended on karst and categorize them as discouraged. Also, quoting WVDEP’s own karst guidance: “attenuating surface runoff will increase the rate of sinkhole formation and potential groundwater contamination.” Yet the entity currently planning to utilize this zoning change is planning employment of multiple massive retention ponds and attenuating surface runoff completely. This has already been approved by the DEP in two Construction Stormwater General Permit registrations for that company. One of detention ponds is not even regulated by the DEP as it contains process water and has no outlet. Clearly the DEP recognizes the risks but is not appropriately limiting them. Relying on the DEP to protect the public health, safety, welfare, and the environment from any entity in these karst locations is simply as the CNS bulletin said it “inadequate to safeguard the public and the environment.” We must have appropriate zoning that takes into consideration appropriate use of land with karst hydrogeology. Ordinance #2017-302 does not do this, but instead increases the risk to the public and the environment.

A second serious concern is the air emissions from the industry that this zoning will provide for. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. These types of air emissions have been shown to increase the risk of, contribute to, and exacerbate a multitude of developmental, physical, physiological, physiological, cognitive and economic. The exposure of one individual can cause repercussions in multiple generations. Embryos, fetuses, and children are most vulnerable with effects born out over a lifetime, and that of their offspring. Many of these effects only require short-term exposure and some have even been shown to occur at levels below current limits recommended by the World Health Organization. One example of this is that a recent study found that “Even within the limits set by the World Health Organization, the pollutants PM₁₀, SO₂, NO₂, and O₃ are associated with increased risk of treatment for respiratory diseases in children 0 to 6 years of age.” Unfortunately, the US limits are higher than WHO, 300 % higher in the case of PM₁₀!

In fact, in 2019, in the Advice from the Independent Particulate Matter Review Panel (formerly U.S. EPA Clean Air Scientific Advisory Committee Particulate Matter Review Panel) on EPA’s Policy Assessment for the Review of the National Ambient Air Quality Standards for Particulate Matter, it stated that the committee unanimously and unequivocally found that the current primary annual and 24-hour PM_{2.5} National Ambient Air Quality Standards (NAAQS) are not adequate to protect public health. The advice from this 20-member committee, whose scientific disciplines include epidemiology, medicine, toxicology, air quality measurement, air quality modeling, exposure assessment measurement and modeling, risk assessment, statistics, and others, was ignored due presumably to political pressure. Not only are the NAAQS too high in some cases, but due to the measure and mechanism by which they work, they can not replace the safety provided by good land use and zoning regulations, that are meant to do things like keep factories with air emissions and hundreds of heavy trucks away from elementary schools. In fact, there is a state law that prohibits siting a school near a factory. Unfortunately, the reciprocal law does not exist. Clearly, just like with the water resources, we cannot rely on the DEP or the EPA to do the job of what appropriate zoning should do. The whole point of zoning is to keep people safe and provide for their health and welfare. Ordinance #2017-302 puts families and school children directly in harms way.

The air emissions, threat to the groundwater, and the very presence of the industry that this zoning change will allow for will have a serious negative economic effect on those who live and or work closest to the site in question. Productivity and workforce participation will be negatively affected by the health effects of the air emissions. The local agricultural operations will be negatively affected by the air emissions with lower quantity and quality of crop yield and would be devastated if the ground water aquifer were fouled. The equine operations in the area, of which there are several, will be negatively affected by the air emissions as they affect the horses’ health and performance. The mere presence of the industry that will be provided for by this zoning change will cause property values to fall. There will be serious economic consequences for the immediate area around the site in question.

Several of the communities in the immediate area of the site for proposed zoning change are traditionally underserved and have lower economic status. The choice of this location for such a zoning change represents an egregious example of environmental injustice that should not be promulgated or tolerated.

This zoning change will provide for industry that will negatively affect the health safety and welfare of our community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Emily Dragon

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Blair Shepard

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would put at risk the health and well being of children of Jefferson County.

The type of industry that ordinance #2017-302 would allow in Ranson would generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. Exposure to these pollutants has devastating effects on children's health. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. Developing fetuses whose mothers are exposed to air pollution are more likely to have impaired organ development which can lead to early cognitive deficits, neurodevelopmental defects and other physical, cognitive, and psychological deficits later in life. An association between autism and prenatal exposure to particulate matter in air pollution has been demonstrated in several studies. Many studies have shown that lower test scores in math, English, and language arts are associated with exposure to outdoor air pollution. Industrial activity allowed by ordinance #2017-302 would also increase the risk of groundwater contamination in Ranson and nearby municipalities. Children whose families rely on well water, as is the case in much of Jefferson County, may be affected by polluted water. Voting no on ordinance #2017-302 will prevent air and water pollution from negatively affecting the long-term health of children in Jefferson County and surrounding areas.

The economic and environmental harm caused by the type of industry that ordinance #2017-302 would allow would put additional stress on the parents, caretakers, and teachers of children in affected areas. The weakening and destabilizing of this support network would have negative effects on local children. Many households in Jefferson County depend on the local agriculture, tourism, and equine industries for income. If industrial activity in Ranson depresses these industries, the resulting financial strain on these households will introduce additional stress and uncertainty into children's lives. Households living in areas affected by particulate

matter and regional haze will also suffer from the psychological effects of air pollution. Individuals living in areas with increase perception of pollution show increased levels of stress, anxiety, and unhappiness. School districts affected by increased air and water pollution may have trouble recruiting and retaining teachers. Teachers have a large influence on a child's daily life and, if educator quality and tenure decreases, the quality of this influence will diminish.

The site of the proposed rezoning in Ranson is across the road from an elementary school and proximal to lower-income neighborhoods. Observations like these demonstrate how ordinance #2017-302 would disproportionately affect vulnerable and historically-disadvantaged populations. The damaging health effects of air pollution have been shown to persist for at least three generations, so allowing certain types of industry in low-income areas would only compound existing disadvantages. Voting no on ordinance #2017-302 would be a step towards acknowledging that all individuals have the right to clean air and water.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." This zoning change would clearly adversely affect the health, safety, and welfare of the community. Children face increased exposure to air pollution adversely affecting their health, financial instability adversely affecting their welfare, groundwater contamination adversely affecting their safety, and environmental injustice and discrimination if ordinance #2017-302 is passed. Educators will face increased air pollution adversely affecting their health and consequently welfare. These adverse effects are all against Ranson's Comprehensive Plan. Please vote NO on Ordinance #2017-302.

Sincerely,

stephen reynolds

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote NO on Ordinance #2017-302. This rezoning will put an undue hardship on the wastewater treatment systems, burden the rate payers and risk surface waterways in Charles Town, risking the health, safety and welfare of the community. The comprehensive plan of Ranson states, the City "will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community." Therefore, please vote NO on #2017-302.

The nature of the industry that this zoning will allow will be harmful to our local economy. Charles Town has spent a lot of time and money improving our downtown area for restaurants and retail. We are working to take advantage of the tourism industry in our county and bring more people into Charles Town. The eye sore, noise pollution, air pollution, and obvious move away from sustainability will drive people away from Jefferson County and Charles Town, rendering our efforts ineffective and unrewarding. This will make it harder for our small businesses to be successful. In this way, the industry this zoning will provide for will adversely affect the welfare of our community.

According to the 2018 WVU economic study of the eastern panhandle, over 40% of the workforce in Jefferson County choose to work outside of the state. These commuters bring that money home and spend it here supporting our local small businesses, economy and government. Charles Town has a large number of residents who commute. These typically higher earners may choose to leave the area because of the presence of the industry that this zoning change would provide for. This will cause a hardship on our economy and municipality. In this way, the industry this zoning will provide for will adversely affect the welfare of our community.

The industry that this zoning will allow will cause stress for multiple reasons on the Charles Town wastewater treatment systems and the surface waterways in Jefferson County and

beyond. The industry currently planning to utilize the zoning change will have discharge to the wastewater system that is high in chloride, primarily from its water softening system. The NPDES permit modification allows up to 5,000 mg/L. Chloride is not settled or removed at the wastewater treatment plant. It cannot be removed by conventional means and would be prohibitively expensive to do by new technology. This is of concern to Charles Town because chloride can harm stream water and also impair functioning of the wastewater treatment plant. Furthermore, the corrosive nature of chloride can cause damage to pipes both in the wastewater system and those used by downstream drinking water systems, like the \$207 million Trap Rock Water Treatment plant in Loudoun.

The human health criteria for chloride under WV standards is 250 mg/L. Under low stream flow conditions, chloride additions to the treatment plant effluent, as proposed by the industry currently planning to utilize the zoning change, could cause chloride levels in Evitts Run to exceed this standard. If the amount of chloride increased due to expansion or higher throughput, then this human health standard would be violated frequently. Chlorides are also known to harm aquatic life and effect metal toxicity in rivers. The USEPA and several states have surface water guidelines of 230mg/L for chronic exposure. This would also pose a risk of damaging the water treatment facilities downstream on the Potomac River.

A research study by Lefebvre and Moletta in 2006 showed that chloride and salinity impair the ability of wastewater treatment to remove phosphorus and nitrogen, and because of this, other states have introduced legislation to treat saline wastewater. Uygur and Kargi in 2004 looked at the effects of salt on synthetic wastewater treatment. They found that removal of both nitrogen and phosphorus was reduced when salinity increased from 0 to 6%. In fact, the removal efficiency of ammonia dropped from 96% to 39% with this increasing salinity. Hong et al. In 2016 found phosphorous removal decreased 20-28% when chloride concentrations went from 150 mg/L to 1,500 mg/L. Phosphorous removal was completely inhibited at concentrations greater than 2,500 mg/L. This increased salinity has the potential to make the Charles Town wastewater treatment system work far less efficiently.

In addition to the contents of the wastewater this type of industry will produce, the volume of sewage is itself a concern. Given that the City of Charles Town has been in violation of its permit on numerous occasions for spills and overflow of untreated sewage, adding large volumes of wastewater will further challenge the near capacity system. This will mean that costly capacity upgrades will need to be done likely sooner than they would have needed to be done, imposing further financial strain on the system. Through these effects, the industry this zoning will provide for will adversely effect the health, safety, and welfare of the community.

This zoning change will provide for industry the likes of which are not present in this county and have not been present in this county for many decades. We find it appalling that the introduction of zoning for such industry is being done in an area of the county that is historically underserved and lower income. It is even more egregious because the worst effects including air pollution and groundwater contamination will be felt first and most severely in the immediate vicinity, and Ranson does not even have residents in the immediate vicinity of the

proposed zoning change. This decision is being contemplated without representation of those who will be most affected. This would be a deplorable example of environmental injustice.

This zoning will provide for industry that will harm our economy, drive away residents, challenge and or damage our infrastructure, and may damage our waterways and wild life. Through these effects, the industry this zoning would allow will adversely effect the health, safety, and welfare of our community. This is being done with out representation of those it will affect the most. Please vote No on Ordinance #2017-302.

Sincerely,

Maria Raso

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

I recently was house hunting and refuse to look in Jefferson county until this issue is resolved. I love this area please keep it safe.

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive

Plan further states, "the City will designate ample land that is well-suited for industrial facilities." This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Kim Smith

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would put at risk the health and well being of children of Jefferson County.

The type of industry that ordinance #2017-302 would allow in Ranson would generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. Exposure to these pollutants has devastating effects on children's health. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. Developing fetuses whose mothers are exposed to air pollution are more likely to have impaired organ development which can lead to early cognitive deficits, neurodevelopmental defects and other physical, cognitive, and psychological deficits later in life. An association between autism and prenatal exposure to particulate matter in air pollution has been demonstrated in several studies. Many studies have shown that lower test scores in math, English, and language arts are associated with exposure to outdoor air pollution. Industrial activity allowed by ordinance #2017-302 would also increase the risk of groundwater contamination in Ranson and nearby municipalities. Children whose families rely on well water, as is the case in much of Jefferson County, may be affected by polluted water. Voting no on ordinance #2017-302 will prevent air and water pollution from negatively affecting the long-term health of children in Jefferson County and surrounding areas.

The economic and environmental harm caused by the type of industry that ordinance #2017-302 would allow would put additional stress on the parents, caretakers, and teachers of children in affected areas. The weakening and destabilizing of this support network would have negative effects on local children. Many households in Jefferson County depend on the local agriculture, tourism, and equine industries for income. If industrial activity in Ranson depresses these industries, the resulting financial strain on these households will introduce additional stress and uncertainty into children's lives. Households living in areas affected by particulate

matter and regional haze will also suffer from the psychological effects of air pollution. Individuals living in areas with increase perception of pollution show increased levels of stress, anxiety, and unhappiness. School districts affected by increased air and water pollution may have trouble recruiting and retaining teachers. Teachers have a large influence on a child's daily life and, if educator quality and tenure decreases, the quality of this influence will diminish.

The site of the proposed rezoning in Ranson is across the road from an elementary school and proximal to lower-income neighborhoods. Observations like these demonstrate how ordinance #2017-302 would disproportionately affect vulnerable and historically-disadvantaged populations. The damaging health effects of air pollution have been shown to persist for at least three generations, so allowing certain types of industry in low-income areas would only compound existing disadvantages. Voting no on ordinance #2017-302 would be a step towards acknowledging that all individuals have the right to clean air and water.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." This zoning change would clearly adversely affect the health, safety, and welfare of the community. Children face increased exposure to air pollution adversely affecting their health, financial instability adversely affecting their welfare, groundwater contamination adversely affecting their safety, and environmental injustice and discrimination if ordinance #2017-302 is passed. Educators will face increased air pollution adversely affecting their health and consequently welfare. These adverse effects are all against Ranson's Comprehensive Plan. Please vote NO on Ordinance #2017-302.

Sincerely,

Irene Reynolds

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask you to vote NO on Ordinance #2017-302. The industry this zoning change will allow for endangers the health, safety and, welfare of the community, and violates the premise of the smart code zoning that we have spent so much time, effort and federal money employing.

This zoning change will provide for industry that will negatively affect the agriculture industry in Jefferson County and beyond. The combination of the air emissions and threat to the ground water resources could have devastating consequences for the agricultural community of Jefferson County.

The comprehensive plan of Ranson is clear: it states, "the City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community." This land is ill-suited for an industrial facility due to its location and hydrogeology. Further, the industry that this zoning change will allow for will adversely affect the health, safety, and welfare of the community through its affect on the agricultural industry.

The agriculture industry in Jefferson County is hundreds of years old and continues to serve our community well today. According to the economic impact study "A Shared Agenda for Growing West Virginia's Agricultural Economy, Prepared by Fourth Economy for West Virginia Department Of Agriculture West Virginia University Extension Service 2012," Jefferson County is the second highest producing county for crops sales, third highest for fruits and vegetables sales, and in the top 9 counties for sales of animals and animal products.

Agriculture, tourism and the equine industries work synergistically to have an outsized positive impact on the economy in Ranson and Jefferson County as a whole. Agriculture drives tourism by creating agro-tourism opportunities, preserving beautiful open spaces that contribute to the

bucolic nature of our county, and providing the locally produced agriculture goods many tourists are look for in our markets and restaurants. Agriculture also supports the equine industry by providing local products like hay and straw, helping maintain pasture land, co-supporting local dual-purpose retail stores, and helping recycle by products. Agriculture helps maintain the way of life that many those who choose to live in Jefferson County enjoy. Industrial manufacturing and industry this zoning will provide for could never achieve these things.

Local agriculture also provides a source of locally produced agricultural goods. It has become apparent with the current pandemic and health emergency. This became a supply chain crisis because as our supply chains have moved to be ever more lean and efficient they lack resiliency and agility. By having a local source of agricultural goods and food we add resiliency and agility into our own economy and community. The agricultural industry in Jefferson County provides this.

A plethora of scientific studies have shown that a variety of air pollutants produced by the type of industry this zoning change would provide for causes decreased yields of both quantity and quality for several of the crops important to Jefferson County including winter wheat and soybeans. Soybeans and wheat are two of the crops significantly affected and two of the most prevalent crops in Jefferson County. Lower crop yields harm the farms and all the members of the down stream supply chain as well as the consumer. In this way, this zoning change will adversely affect the welfare of the community.

Recent studies have shown that even small increases in air pollution affect the productivity of agricultural workers. Similar to the reduction in crop yield this will negatively affect the individual workers, businesses, consumers and industry as a whole. In this way, this zoning change will adversely affect the health and welfare of individuals and the community.

Even more devastating is the possibility of groundwater contamination. The land at the subject location has karst hydrogeology and as such has porous bedrock and severe ground instability problems. The porous bedrock allows rapid diffuse infiltration of surface water into ground water and the severe ground instability problems leads to sinkhole development. Sinkholes provide direct connection of the surface water with the ground water aquifer through point infiltration. In fact, according to a 2012 study by Doctor and Doctor, the subject location and that of Terrapins Neck have the highest sinkhole vulnerability of any sites in Jefferson County. The propensity and easy of diffuse and point infiltration in areas of karst hydrogeology give them very high aquifer vulnerability meaning the aquifer is very vulnerable to contamination. For this reason, this measure has been used for decades by policymakers to set land use regulations. In this way, this zoning change and the industry it will provide for will adversely affect the welfare of the community.

The WVDEP recognizes development in car karst areas puts water resources high-risk for contamination but also recognizes that this is best protected against true local land use and zoning ordinances. WVDEP's guiding document Stormwater Management Design in Karst Areas

states, "it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." This document also references the Chesapeake Bay Stormwater Network karst stormwater guidance document the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed. In which it states "...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." Land use policy in Ranson and zoning need to take aquifer vulnerability into consideration as these agencies and documents suggest.

The Jefferson Orchards Voluntary Remediation Plan application reports that the ground water is only 60 feet from the surface at the site. It is described in the scientific literature that this land is an upland plane with large amounts of water in the epikarst, and contamination of this water effects the whole aquifer including the communications with surface water streams. A USGS study demonstrated that the groundwater adjacent to the site communicates readily with several surface water structures and wells miles away from the site. The effects of contamination at this site would go well beyond Ranson fouling large portions of the ground water and surface water in Jefferson County.

Groundwater contamination at the site would have devastating effects on the Agricultural industry in Jefferson county. For geographic and economic reasons it is simply infeasible for the agricultural industry to rely on utility provided water. Based on the scientific literature the site being considered for rezoning is one of the areas of highest aquifer vulnerability in Jefferson County and is inappropriate for the industry that this zoning change will provide for. This land is clearly ill-suited for industrial use and should not be zoned for it.

By threatening the local agricultural industry, the industry that this zoning will provide for will threaten the health, safety, and welfare of the community, and this land is not well-suited for industrial use. The Comprehensive Plan in Ranson is clear the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Joyce McCright

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask you to vote NO on Ordinance #2017-302. The industry this zoning change will allow for endangers the health, safety and, welfare of the community, and violates the premise of the smart code zoning that we have spent so much time, effort and federal money employing.

Any change in zoning needs to align with the comprehensive plan. In Ranson's current comprehensive plan (2012), the city only refers to "heavy industry" in the history section. Here it is characterized as part of a bygone era that has been replaced by an emphasis on agriculture for local food production, open spaces, and quality-of-life. In the remainder of the document, the word industry is used loosely to describe businesses including flower shops and shoe stores. Nothing that resembles the industry that this zoning change will provide for is described in the current comprehensive plan of Ranson.

In the land use section of the comprehensive plan, number ten states:

"Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The comprehensive plan clearly states that the city will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community. This change in zoning clearly negatively affects the health, safety, and welfare of the community.

As the zoning is proposed, the industry that this zoning change will allow for will be directly across the street from houses, parks and other small businesses. A densely populated subdivision and an elementary school already exit directly across the street. While these latter

community sections are not in the city limits, the effect of this zoning on them should still be considered just the same as it would be if they were in the city limits.

The industry that this zoning change will provide for will produce particulate, gaseous, and hazardous air emissions. These emissions have been shown to be detrimental to human health at every stage of life from embryo to old age. In utero and childhood exposure are the most damaging with lasting effects being realized through out life, and with maternal exposure the effects can be felt for generations. Multiple organ systems are affected including respiratory, cardiovascular, neurologic, immune, and endocrine causing defects in multiple processes including in utero development, neurodevelopment, immune and tolerance development, and cognitive defects. There are also psychological, social, and economic effects from both perceived and actual air pollution in both children and adults. Many of these effects can be seen even with short-term exposure or exposure that is lower than the levels recommended by the US Environmental Protection Agency and World Health Organization. These consequences are devastating to the individual and depressing to the local community and economy. State law does not allow a school to be built next to industry that this zoning will allow but yet we are contemplating changing the zoning so this industry can build next to a school. This does not make sense. As Ranson residents, we want Ranson to follow the lead of the state and keep polluting industry away from kids. In these ways, this change in zoning will negatively affect the health and welfare of the community.

In addition to the health effects of the air emissions is the threat to groundwater from the industry that this zoning change would allow. The land in question has karst hydrogeology and therefore very high aquifer vulnerability and is not appropriate for this industry. With the type of industry this zoning will provide for, combined with high aquifer vulnerability, the likelihood of groundwater contamination is too high for the community and region to bear. A USGS study demonstrated that contamination in the groundwater adjacent to the site moves relatively quickly and can be found in wells and surface water structures in a variety of locations in the County. In this way, contamination at the site would affect the drinking water of the great majority of Jefferson County residents. Through the surface water connections, the water at the site also affects the water resources of the region.

Aquifer vulnerability has been used by policy makers for decades to set land use regulations. The guiding document, from the WVDEP, Stormwater Management Design in Karst Areas states, "it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." In Ranson, we need to follow this advice and not change the zoning of this land for use by industry that has among the highest aquifer vulnerability in the County. This zoning change will endanger the safety of the community and region by endangering the safe water resources. As Ranson residents, we want to safeguard the water resources of the county and region by following the WVDEP guidance here.

Further, by reallocating this transect district and replacing it with a monolithic block of Special District Industrial designation, hundreds of housing units, parks and space for small businesses are lost. Ranson loses the potential for property tax on these properties and their improvements, Business and Occupational tax on the businesses and sales tax in retail stores. The community loses out on the opportunity to develop affordable housing and create locations where people can live, work, play, and shop all in the same place reducing the need for travel.

Worse yet apparently a deal has been made where the entity that owns the subject land has required that a litany of things not be built on the adjacent land essentially stripping the purpose of the smart code transect zone that exists there. Transect zones in the smart code are meant to transition, from out to in, and provide communities where people can safely work and live in close proximity in an effort to reduce travel. Excluding many of the components of the transect zone effectively eliminates the features that make it a transect zone, thus, losing the benefits a transect zone offers the community and city. By losing these benefits, reducing the overall and affordable housing prospects, and reducing so drastically the opportunities for city income, this zoning change will negatively affect the welfare of the community.

As Ranson residents, we find it odd that we are changing zoning to provide for industry that we would not put in the middle of our town close to our residents, but we are placing it close to the homes of county residents. Further, it is striking that the area where this change in zoning is directly adjacent to historically underserved lower income communities and a Title I school. This amounts to environmental injustice and cannot be tolerated.

The purpose of zoning is for a city to protect the health, welfare, morals and safety of the community. In this case, the air emissions and heavy truck traffic will endanger the communities' health. The threat of water contamination will endanger the safety of the community. The effect of lost productivity and decreased workforce participation due to increased illness and the negative effect the air emissions and presence of such a factory will have on the local economy will negatively affect the welfare of the community. The environmental injustice of changing the zoning to accommodate such polluting industry in a location where your municipality has no residents, but yet hundreds of low income and underserved county residents live is egregiously amoral. This must not happen. We respectfully implore you to do the right thing and vote no on ordinance #2017-302.

Sincerely,

Adam Snyder

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

william blalock

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask that you vote no on Ordinance #2017-302. While not in Ranson, the land and homes around the property that is the subject of the zoning change are closer to the property than anyone who currently lives within the city limits of Ranson. This area will be affected sooner and more harshly by the environmental issues that will develop secondary to the inappropriate siting of industry this zoning would allow.

The subject land has been well studied by Drs. Kozar, Doctor and Doctor and described in the scientific literature and USGS reports as having karst hydrology with very high aquifer vulnerability. The karst landscape is a consequence of the presence of soluble bedrock, which consists of limestone in the case of the subject land. In such landscapes water percolates through the ground and dissolves the underlying rock creating a porous network of caverns and throughways. Karst aquifers are known to be "extremely vulnerable to pollution" due to direct connection between the surface water and groundwater through both point (sinkholes) and diffuse (everywhere) infiltration. It is known from the Voluntary Remediation Plan of Jefferson Orchard that the groundwater at the subject site is only 60 feet below the ground. The subject property and much of the property around it are on an upland plain with few surface streams, but great seasonal variability in the water table resulting in numerous esteves and large amounts of water in the epikarst. This water is easily contaminated and this contamination spreads quickly throughout the aquifer. Dye tests performed near the subject site by the USGS have demonstrated this quick moving thorough dispersment in the aquifer in this area. While this contamination goes on to affect springs at the margins of the upland area continuing on in streams that service municipal water sources and the Potomac River, our concerns are far more immediate in both time and distance. Well water is the only water source available in the area of the proposed zoning change and, with the exception of Fox Glen, a majority of this water is supplied by private wells. Therefore, the groundwater aquifer fulfills a critical necessity, fulfilling all needs including human consumption, household uses, and agriculture and

maintenance of livestock and horses in the immediate area around the site. The concern is that if the aquifer becomes contaminated, then the local drinking water will be fouled.

For decades now, policy makers have been using “Aquifer Vulnerability,” to set land use and water resource protection policy. Karst has very high Aquifer Vulnerability. Therefore, this industrial use is not appropriate for this land and it should not be zoned for it. The guiding documents of the WVDEP recognize this. The introduction to the WVDEP document Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.”

The Chesapeake Bay Stormwater Network karst stormwater guidance document the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed, which the WVDEP cites in its own guiding document Stormwater Management Design in Karst Areas, clearly agrees stating:

“First, the effect of land development on karst terrain is complex and hard to predict, and requires professional analysis to reduce the risk of geological hazards, damage to infrastructure and groundwater contamination.” “The working group acknowledges that past approaches to stormwater and land development in karst terrain have been inadequate to safeguard the public and the environment.” “...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” We clearly need stronger comprehensive land use plans and zoning that direct new growth away from karst areas to more appropriate locations. Ordinance #2017-302 is literally the opposite of this.

Further, we cannot rely on the WVDEP to do the job that good local land use guidelines and zoning should do. For example, the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed states that detention and retention ponds are not recommended on karst and categorize them as discouraged. Also, quoting WVDEP’s own karst guidance: “attenuating surface runoff will increase the rate of sinkhole formation and potential groundwater contamination.” Yet the entity currently planning to utilize this zoning change is planning employment of multiple massive retention ponds and attenuating surface runoff completely. This has already been approved by the DEP in two Construction Stormwater General Permit registrations for that company. One of detention ponds is not even regulated by the DEP as it contains process water and has no outlet. Clearly the DEP recognizes the risks but is not appropriately limiting them. Relying on the DEP to protect the public health, safety, welfare, and the environment from any entity in these karst locations is simply as the CNS bulletin said it “inadequate to safeguard the public and the environment.” We must have appropriate zoning that takes into consideration appropriate use of land with karst hydrogeology. Ordinance #2017-302 does not do this, but instead increases the risk to the public and the environment.

A second serious concern is the air emissions from the industry that this zoning will provide for. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. These types of air emissions have been shown to increase the risk of, contribute to, and exacerbate a multitude of developmental, physical, physiological, physiological, cognitive and economic. The exposure of one individual can cause repercussions in multiple generations. Embryos, fetuses, and children are most vulnerable with effects born out over a lifetime, and that of their offspring. Many of these effects only require short-term exposure and some have even been shown to occur at levels below current limits recommended by the World Health Organization. One example of this is that a recent study found that “Even within the limits set by the World Health Organization, the pollutants PM₁₀, SO₂, NO₂, and O₃ are associated with increased risk of treatment for respiratory diseases in children 0 to 6 years of age.” Unfortunately, the US limits are higher than WHO, 300 % higher in the case of PM₁₀!

In fact, in 2019, in the Advice from the Independent Particulate Matter Review Panel (formerly U.S. EPA Clean Air Scientific Advisory Committee Particulate Matter Review Panel) on EPA’s Policy Assessment for the Review of the National Ambient Air Quality Standards for Particulate Matter, it stated that the committee unanimously and unequivocally found that the current primary annual and 24-hour PM_{2.5} National Ambient Air Quality Standards (NAAQS) are not adequate to protect public health. The advice from this 20-member committee, whose scientific disciplines include epidemiology, medicine, toxicology, air quality measurement, air quality modeling, exposure assessment measurement and modeling, risk assessment, statistics, and others, was ignored due presumably to political pressure. Not only are the NAAQS too high in some cases, but due to the measure and mechanism by which they work, they can not replace the safety provided by good land use and zoning regulations, that are meant to do things like keep factories with air emissions and hundreds of heavy trucks away from elementary schools. In fact, there is a state law that prohibits siting a school near a factory. Unfortunately, the reciprocal law does not exist. Clearly, just like with the water resources, we cannot rely on the DEP or the EPA to do the job of what appropriate zoning should do. The whole point of zoning is to keep people safe and provide for their health and welfare. Ordinance #2017-302 puts families and school children directly in harms way.

The air emissions, threat to the groundwater, and the very presence of the industry that this zoning change will allow for will have a serious negative economic effect on those who live and or work closest to the site in question. Productivity and workforce participation will be negatively affected by the health effects of the air emissions. The local agricultural operations will be negatively affected by the air emissions with lower quantity and quality of crop yield and would be devastated if the ground water aquifer were fouled. The equine operations in the area, of which there are several, will be negatively affected by the air emissions as they affect the horses’ health and performance. The mere presence of the industry that will be provided for by this zoning change will cause property values to fall. There will be serious economic consequences for the immediate area around the site in question.

Several of the communities in the immediate area of the site for proposed zoning change are traditionally underserved and have lower economic status. The choice of this location for such a zoning change represents an egregious example of environmental injustice that should not be promulgated or tolerated.

This zoning change will provide for industry that will negatively affect the health safety and welfare of our community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Eldred Hill

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Thomas Dymacek

To: spfaltzgraff@ransonwv.us; dpierson@ransonwv.us; gtaylor@ransonwv.us; scoulter@frontiernet.net; tgrant@ransonwv.us; astroud@ransonwv.us; andersonantS@aol.com; donhainessr@gmail.com
Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would negatively affect tourism, economic agility, groundwater quality, and individual health in neighboring municipalities like Shepherdstown. In doing these things the industry that this zoning change provides for will adversely affect the health, safety, and welfare of our community.

Tourism is critically important to Shepherdstown's economy and to the county as a whole. In 2018, tourist spending in the Jefferson County contributed over \$170 million to state and local government revenue and \$213 million in individual earnings. Importantly, most of this money comes from tourists visiting from neighboring states like Virginia, Maryland, and Washington D.C. Out-of-state tourists are largely drawn to Jefferson County because of its reputation for environmental-friendly, sustainable industry. Key elements that support this reputation include the county's pastoral scenery and pristine natural resources. Ordinance #2017-302 will allow industry into Jefferson County that risks harming these elements and dramatically reducing the area's appeal to visitors. The resulting harm to our tourist industry would drive away visitors and decrease state, county, and local revenue. The long-term success of Jefferson County's tourism industry is dependent on local governments making coordinated zoning decisions. Allowing certain types in industry in Ranson will negatively affect tourism in every municipality throughout the county, including Shepherdstown. Voting no on ordinance #2017-302 will protect the foundations of the county's tourism industry and protect the 7,040 jobs in Jefferson County that are directly supported by tourism. In this way, the industry this zoning change will allow will adversely affect the welfare of our community.

The type of large, consolidated industry that ordinance #2017-302 would allow in Ranson would generally reduce the flexibility of local economies in Jefferson County. Historically, the driving industries in Jefferson County have been tourism, agriculture, and the equine industries. These three industries are large conglomerates of small businesses. Small business is very important

to Shepherdstown. Small businesses have been shown to create more jobs, cultivate more innovation, and provide more opportunities than big, non-local firms. Additionally, small businesses have been shown to be more reactive to sudden changes relative to manufacturing businesses. Bringing large, manufacturing-based industry into Jefferson county will depress the local economy and stifle innovation. During this time of economic upheaval and uncertainty, Jefferson County needs to support industries that will allow local economies to adapt and recover as fast as possible.

Voting no on ordinance #2017-302 will help protect water resources throughout Jefferson County. The type of industry that ordinance #2017-302 would allow puts the ground resources of Jefferson county at significant risk due to the karst hydrogeology. The site in Ranson is in the Rocky Marsh Run watershed, which is in the source water protection zone for Shepherdstown and drains to the Potomac River. Therefore, activity at this site will affect both groundwater and surface water streams. In municipalities like Shepherdstown, many residents and nearby farms depend on wells for water. Contamination of groundwater aquifers would create both health and remediation concerns for local residents. Dye tests performed by the USGS near the area of proposed rezoning in Ranson have shown just how far-reaching groundwater contamination at the Ranson site could be. Results from the USGS study revealed measurable dye concentrations in Elk's Run, Rattlesnake Run, and even the Shepherdstown Town Run. This last run cuts through the center of Shepherdstown and is a favorite area for children to play and learn to fish. In this way, the industry that this zoning change will allow will adversely affect the safety of our community.

Groundwater pollution is not the only concern for communities like Shepherdstown. The type of industry that ordinance #2017-302 would allow in Ranson would also generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. These pollutants are particularly harmful to children. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. The site in Ranson is across the road from an elementary school and also within the Jefferson High Middle district. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of children in Shepherdstown and all of Jefferson County. In this way, the industry that this zoning change will provide for will adversely affect the health of our community.

I again request that you vote no on ordinance #2017-302. This zoning change will allow industry that will adversely affect the health, safety, and welfare of our community. The long-term economic, environmental, and community health of municipalities like Shepherdstown depend on Ranson's participation in a coordinated zoning plan for all of Jefferson County.

Sincerely,

Virginia Byron
Shepherdstown, 25443

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on #2017-302. The air emissions, possibility of ground and surface water contamination, and their effect on our interwoven economies threaten the health, safety and welfare of not just Jefferson County but the greater region, including Loudoun and the greater Northern Virginia area.

This zoning would provide for industry that produces large amounts of air emissions. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. Northern Virginia is directly downwind from these emissions. Much of the gaseous, fine particulate, and hazardous emissions can reach Northern Virginia. Further affecting the outdoor air quality of the adjacent portion of Virginia and the ability of these areas to achieve and maintain National Ambient Air Quality Standards (NAAQS) attainment. This will affect agriculture and outdoor leisure and recreation.

For example, Loudoun County has been in nonattainment for the NAAQS 8-hour Ozone standard for the past two years. VOC and NO_x react after they have been emitted to produce ground level ozone. The industry that this rezoning would provide for would produce large amounts of these emissions. This would make it even harder as Loudoun County tries to achieve attainment. As time goes on and the scientific research advances our knowledge and understanding of the extent to which gaseous, particulate and hazardous emissions affect human health the NAAQS standards are likely to be reduced. The effects on air emission from this rezoning will make it only harder for Loudoun and Northern Virginia to meet these standards.

In addition to the concerns about the air, the possible ground and surface water contamination is very concerning to Loudoun and Virginia residents. The site is known to have ground water that is vulnerable to contamination due to the karst hydrogeology. A USGS study demonstrated that the ground water adjacent to the site to be rezoned communicates readily with surface

water tributaries of the Potomac River. In addition to direct infiltration where water moves directly from the surface to groundwater via porous limestone bedrock, karst is known to have severe ground instability problems. This makes karst geology prone to sinkhole development. Sinkholes provide direct connection between the surface water and any contaminants it may contain and the groundwater. This makes the aquifer vulnerability in karst areas very high, and contamination with industrial activity such as that provided for by this rezoning too likely. In this way, this zoning change will adversely affect the health and welfare of individuals and the community.

Loudoun sources its drinking water from the Potomac River, downstream of many West Virginia tributaries that carry water from the epikarst and groundwater aquifer at the site to be rezoned. Loudoun has recently completed the new Trap Rock Water Treatment facility, which draws water from the Potomac River. Loudoun currently provides 40 million gallons and projects to provide 90 million gallons of drinking water a day to customers by 2040 (Loudounwater.org). Therefore, the viability of the Potomac River is a high priority for Virginia residents.

Loudoun and Northern Virginia is one of the fastest growing communities in the country and provides a lot to Jefferson County in their symbiotic relationship. Virginia residents support and enjoy Jefferson County through tourism, as our residents enjoy the natural and historical resources of your county. Virginia residents and businesses support the equine industry in a multitude of ways from providing wagering fans at the races to the Virginia Breeders Association Virginia Certified incentive programs and a strong market for retired racehorses. According to an economic impact study from WVU, at least 40% of Jefferson County residents travel outside of West Virginia for work, a good percentage of those travel to northern Virginia. This rezoning would allow for industry that would negatively affect the economy of both places and this relationship and the benefits for our residents gleaned from it.

This zoning change will provide for industry that will negatively effect the health safety and welfare of the Loudoun and Northern Virginia community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Krystina Agresta

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask you to vote NO on Ordinance #2017-302. Vote NO for all the reasons that I will list and so many others. Vote NO for yourselves, your family, for mine, for theirs - your neighbors in this beautiful county and the larger Mid-Atlantic Region. Your decision impacts more than just Ranson, but Jefferson County, the DMV Metro Area, the Chesapeake Bay and all its residents for now and for the future. We teach our kids to do what is right and stand up for what is right. How can we not do the same? This is an opportunity to step up, to Stand Up and say YES to health, to say YES to economic opportunities that not only advance the economy of our area but does it sustainably through agriculture, tourism and small business. Say NO to Corporate Greed and collusion. Say NO to foreign entities that seek to establish heavy industry far away from themselves. Say Yes to my kids, to yours. Research PM 2.5 and NOx exposure and the respiratory impacts of significantly lower lung function in children. In the current pandemic - respiratory compromises are a death sentence for many. The future health climate will present more challenges like this one. Don't we want to give ourselves and our community every chance for health physically and economically? We don't want to open up our beautiful county to more heavy industry - so say NO. Say no for all the reasons.

The industry this zoning change will allow for endangers the health, safety and, welfare of the community, and violates the premise of the smart code zoning that we have spent so much time, effort and federal money employing.

This zoning change will provide for industry that will negatively affect the agriculture industry in Jefferson County and beyond. The combination of the air emissions and threat to the ground water resources could have devastating consequences for the agricultural community of Jefferson County.

The comprehensive plan of Ranson is clear: it states, "the City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect

the health, safety, or welfare of the community.” This land is ill-suited for an industrial facility due to its location and hydrogeology. Further, the industry that this zoning change will allow for will adversely affect the health, safety, and welfare of the community through its affect on the agricultural industry.

The agriculture industry in Jefferson County is HUNDREDS of years old and continues to serve our community well today. According to the economic impact study “A Shared Agenda for Growing West Virginia’s Agricultural Economy, Prepared by Fourth Economy for West Virginia Department Of Agriculture West Virginia University Extension Service 2012,” Jefferson County is the second highest producing county for crops sales, third highest for fruits and vegetables sales, and in the top 9 counties for sales of animals and animal products.

Agriculture, tourism and the equine industries work synergistically to have an outsized positive impact on the economy in Ranson and Jefferson County as a whole. Agriculture drives tourism by creating agro-tourism opportunities, preserving beautiful open spaces that contribute to the bucolic nature of our county, and providing the locally produced agriculture goods many tourists are look for in our markets and restaurants. Agriculture also supports the equine industry by providing local products like hay and straw, helping maintain pasture land, co-supporting local dual-purpose retail stores, and helping recycle by products. Agriculture helps maintain the way of life that many those who choose to live in Jefferson County enjoy. Industrial manufacturing and industry this zoning will provide for could never achieve these things.

Local agriculture also provides a source of locally produced agricultural goods. It has become apparent with the current pandemic and health emergency. This became a supply chain crisis because as our supply chains have moved to be ever more lean and efficient they lack resiliency and agility. By having a local source of agricultural goods and food we add resiliency and agility into our own economy and community. The agricultural industry in Jefferson County provides this.

A plethora of scientific studies have shown that a variety of air pollutants produced by the type of industry this zoning change would provide for causes decreased yields of both quantity and quality for several of the crops important to Jefferson County including winter wheat and soybeans. Soybeans and wheat are two of the crops significantly affected and two of the most prevalent crops in Jefferson County. Lower crop yields harm the farms and all the members of the down stream supply chain as well as the consumer. In this way, this zoning change will adversely affect the welfare of the community.

Recent studies have shown that even small increases in air pollution affect the productivity of agricultural workers. Similar to the reduction in crop yield this will negatively affect the individual workers, businesses, consumers and industry as a whole. In this way, this zoning change will adversely affect the health and welfare of individuals and the community.

Even more devastating is the possibility of groundwater contamination.

The land at the subject location has karst hydrogeology and as such has porous bedrock and severe ground instability problems. The porous bedrock allows rapid diffuse infiltration of surface water into ground water and the severe ground instability problems leads to sinkhole development. Sinkholes provide direct connection of the surface water with the ground water aquifer through point infiltration. In fact, according to a 2012 study by Doctor and Doctor, the subject location and that of Terrapins Neck have the highest sinkhole vulnerability of any sites in Jefferson County. The propensity and easy of diffuse and point infiltration in areas of karst hydrogeology give them very high aquifer vulnerability meaning the aquifer is very vulnerable to contamination. For this reason, this measure has been used for decades by policymakers to set land use regulations. In this way, this zoning change and the industry it will provide for will adversely affect the welfare of the community.

The WVDEP recognizes development in karst areas puts water resources high-risk for contamination but also recognizes that this is best protected against true local land use and zoning ordinances. WVDEP's guiding document Stormwater Management Design in Karst Areas states, "it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." This document also references the Chesapeake Bay Stormwater Network karst stormwater guidance document the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed. In which it states "...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." Land use policy in Ranson and zoning need to take aquifer vulnerability into consideration as these agencies and documents suggest.

The Jefferson Orchards Voluntary Remediation Plan application reports that the ground water is only 60 feet from the surface at the site. It is described in the scientific literature that this land is an upland plane with large amounts of water in the epikarst, and contamination of this water effects the whole aquifer including the communications with surface water streams. A USGS study demonstrated that the groundwater adjacent to the site communicates readily with several surface water structures and wells miles away from the site. The effects of contamination at this site would go well beyond Ranson fouling large portions of the ground water and surface water in Jefferson County.

Groundwater contamination at the site would have devastating effects on the Agricultural industry in Jefferson county. For geographic and economic reasons it is simply infeasible for the agricultural industry to rely on utility provided water. Based on the scientific literature the site being considered for rezoning is one of the areas of highest aquifer vulnerability in Jefferson County and is inappropriate for the industry that this zoning change will provide for. This land is clearly ill-suited for industrial use and should not be zoned for it.

By threatening the local agricultural industry, the industry that this zoning will provide for will threaten the health, safety, and welfare of the community, and this land is not well-suited for industrial use. The Comprehensive Plan in Ranson is clear the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

As an elected official, the responsibility is to the people. Not to foreign corporations. Not to fear of reprisals and law suits. To the people, for the people. Evaluate the response to this singular issue. How many count YES and how many count NO? Let that dictate the people's voice. Know that the people will stand with the people who represent them well. This is a challenge and a big one. Don't act in fear...again I point to our children - we raise them to not be bullied and to not go with the flow, to stand up for the little guy, for justice. I urge you to vote NO. As Hippocrates once said and the medical profession pledge at the onset of their practice. FIRST, Do No Harm. Please, I urge you to Vote No.

Sincerely,

Kelly Edwards

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on #2017-302. The air emissions, possibility of ground and surface water contamination, and their effect on our interwoven economies threaten the health, safety and welfare of not just Jefferson County but the greater region, including Loudoun and the greater Northern Virginia area.

This zoning would provide for industry that produces large amounts of air emissions. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. Northern Virginia is directly downwind from these emissions. Much of the gaseous, fine particulate, and hazardous emissions can reach Northern Virginia. Further affecting the outdoor air quality of the adjacent portion of Virginia and the ability of these areas to achieve and maintain National Ambient Air Quality Standards (NAAQS) attainment. This will affect agriculture and outdoor leisure and recreation.

For example, Loudoun County has been in nonattainment for the NAAQS 8-hour Ozone standard for the past two years. VOC and NO_x react after they have been emitted to produce ground level ozone. The industry that this rezoning would provide for would produce large amounts of these emissions. This would make it even harder as Loudoun County tries to achieve attainment. As time goes on and the scientific research advances our knowledge and understanding of the extent to which gaseous, particulate and hazardous emissions affect human health the NAAQS standards are likely to be reduced. The effects on air emission from this rezoning will make it only harder for Loudoun and Northern Virginia to meet these standards.

In addition to the concerns about the air, the possible ground and surface water contamination is very concerning to Loudoun and Virginia residents. The site is known to have ground water that is vulnerable to contamination due to the karst hydrogeology. A USGS study demonstrated that the ground water adjacent to the site to be rezoned communicates readily with surface

water tributaries of the Potomac River. In addition to direct infiltration where water moves directly from the surface to groundwater via porous limestone bedrock, karst is known to have severe ground instability problems. This makes karst geology prone to sinkhole development. Sinkholes provide direct connection between the surface water and any contaminants it may contain and the groundwater. This makes the aquifer vulnerability in karst areas very high, and contamination with industrial activity such as that provided for by this rezoning too likely. In this way, this zoning change will adversely affect the health and welfare of individuals and the community.

Loudoun sources its drinking water from the Potomac River, downstream of many West Virginia tributaries that carry water from the epikarst and groundwater aquifer at the site to be rezoned. Loudoun has recently completed the new Trap Rock Water Treatment facility, which draws water from the Potomac River. Loudoun currently provides 40 million gallons and projects to provide 90 million gallons of drinking water a day to customers by 2040 (Loudounwater.org). Therefore, the viability of the Potomac River is a high priority for Virginia residents.

Loudoun and Northern Virginia is one of the fastest growing communities in the country and provides a lot to Jefferson County in their symbiotic relationship. Virginia residents support and enjoy Jefferson County through tourism, as our residents enjoy the natural and historical resources of your county. Virginia residents and businesses support the equine industry in a multitude of ways from providing wagering fans at the races to the Virginia Breeders Association Virginia Certified incentive programs and a strong market for retired racehorses. According to an economic impact study from WVU, at least 40% of Jefferson County residents travel outside of West Virginia for work, a good percentage of those travel to northern Virginia. This rezoning would allow for industry that would negatively affect the economy of both places and this relationship and the benefits for our residents gleaned from it.

This zoning change will provide for industry that will negatively effect the health safety and welfare of the Loudoun and Northern Virginia community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change.

We have just moved to the area recently. My hope is to raise my two young daughters (aged 3 and 4) in Loudoun county. This decision will impact all of our lives. Please vote no on the ordinance #2017-302.

Sincerely,

Ava

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would negatively affect tourism, economic agility, groundwater quality, and individual health in neighboring municipalities like Shepherdstown. In doing these things the industry that this zoning change provides for will adversely affect the health, safety, and welfare of our community.

Tourism is critically important to Shepherdstown's economy and to the county as a whole. In 2018, tourist spending in the Jefferson County contributed over \$170 million to state and local government revenue and \$213 million in individual earnings. Importantly, most of this money comes from tourists visiting from neighboring states like Virginia, Maryland, and Washington D.C. Out-of-state tourists are largely drawn to Jefferson County because of its reputation for environmental-friendly, sustainable industry. Key elements that support this reputation include the county's pastoral scenery and pristine natural resources. Ordinance #2017-302 will allow industry into Jefferson County that risks harming these elements and dramatically reducing the area's appeal to visitors. The resulting harm to our tourist industry would drive away visitors and decrease state, county, and local revenue. The long-term success of Jefferson County's tourism industry is dependent on local governments making coordinated zoning decisions. Allowing certain types in industry in Ranson will negatively affect tourism in every municipality throughout the county, including Shepherdstown. Voting no on ordinance #2017-302 will protect the foundations of the county's tourism industry and protect the 7,040 jobs in Jefferson County that are directly supported by tourism. In this way, the industry this zoning change will allow will adversely affect the welfare of our community.

The type of large, consolidated industry that ordinance #2017-302 would allow in Ranson would generally reduce the flexibility of local economies in Jefferson County. Historically, the driving industries in Jefferson County have been tourism, agriculture, and the equine industries. These three industries are large conglomerates of small businesses. Small business is very important

to Shepherdstown. Small businesses have been shown to create more jobs, cultivate more innovation, and provide more opportunities than big, non-local firms. Additionally, small businesses have been shown to be more reactive to sudden changes relative to manufacturing businesses. Bringing large, manufacturing-based industry into Jefferson county will depress the local economy and stifle innovation. During this time of economic upheaval and uncertainty, Jefferson County needs to support industries that will allow local economies to adapt and recover as fast as possible.

Voting no on ordinance #2017-302 will help protect water resources throughout Jefferson County. The type of industry that ordinance #2017-302 would allow puts the ground resources of Jefferson county at significant risk due to the karst hydrogeology. The site in Ranson is in the Rocky Marsh Run watershed, which is in the source water protection zone for Shepherdstown and drains to the Potomac River. Therefore, activity at this site will affect both groundwater and surface water streams. In municipalities like Shepherdstown, many residents and nearby farms depend on wells for water. Contamination of groundwater aquifers would create both health and remediation concerns for local residents. Dye tests performed by the USGS near the area of proposed rezoning in Ranson have shown just how far-reaching groundwater contamination at the Ranson site could be. Results from the USGS study revealed measurable dye concentrations in Elk's Run, Rattlesnake Run, and even the Shepherdstown Town Run. This last run cuts through the center of Shepherdstown and is a favorite area for children to play and learn to fish. In this way, the industry that this zoning change will allow will adversely affect the safety of our community.

Groundwater pollution is not the only concern for communities like Shepherdstown. The type of industry that ordinance #2017-302 would allow in Ranson would also generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. These pollutants are particularly harmful to children. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. The site in Ranson is across the road from an elementary school and also within the Jefferson High Middle district. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of children in Shepherdstown and all of Jefferson County. In this way, the industry that this zoning change will provide for will adversely affect the health of our community.

I again request that you vote no on ordinance #2017-302. This zoning change will allow industry that will adversely affect the health, safety, and welfare of our community. The long-term economic, environmental, and community health of municipalities like Shepherdstown depend on Ranson's participation in a coordinated zoning plan for all of Jefferson County.

Sincerely,

Sue Kennedy

Council Members,

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

It isn't very often in life that you get a "do-over" like this. I do not believe for a second that any one of you would have willfully voted for this thing in the first place if you'd known what we know now.... that kids' health would be put at risk by toxic emissions, that our water supply would be endangered by poison sludge ponds lined only with flimsy rubber liners sitting on top of sinkholes that drain into our aquifer, that giant smokestacks would ruin our touristic views, and that our community would be rent assunder by such a dishonest foreign company. This company lied to you again and again about "steamstacks" with emissions "cleaner than the ambient air" - a company that has poisoned many communities around the globe who could only DREAM of a "do-over" like you are now getting.... a toxic company that would change our farming/tourist county into a poisoned industrial mess. Yes, you are being asked to take on quite a task by reversing this decision... but a "step backward is a step in the right direction when you've made a wrong turn". The good news is that the citizens of Ranson and the entire county are ready and willing to support you as you do the Bold and Right thing. Heaven is granting you a do-over, so be strong and courageous. For the sake of our health, and for the sake of our beautiful Jefferson County, please vote NO on ordinance #2017-302.

Sincerely,

Shaun Amos

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask that you vote no on Ordinance #2017-302. While not in Ranson, the land and homes around the property that is the subject of the zoning change are closer to the property than anyone who currently lives within the city limits of Ranson. This area will be affected sooner and more harshly by the environmental issues that will develop secondary to the inappropriate siting of industry this zoning would allow.

The subject land has been well studied by Drs. Kozar, Doctor and Doctor and described in the scientific literature and USGS reports as having karst hydrology with very high aquifer vulnerability. The karst landscape is a consequence of the presence of soluble bedrock, which consists of limestone in the case of the subject land. In such landscapes water percolates through the ground and dissolves the underlying rock creating a porous network of caverns and throughways. Karst aquifers are known to be "extremely vulnerable to pollution" due to direct connection between the surface water and groundwater through both point (sinkholes) and diffuse (everywhere) infiltration. It is known from the Voluntary Remediation Plan of Jefferson Orchard that the groundwater at the subject site is only 60 feet below the ground. The subject property and much of the property around it are on an upland plain with few surface streams, but great seasonal variability in the water table resulting in numerous estavelles and large amounts of water in the epikarst. This water is easily contaminated and this contamination spreads quickly throughout the aquifer. Dye tests performed near the subject site by the USGS have demonstrated this quick moving thorough dispersment in the aquifer in this area. While this contamination goes on to affect springs at the margins of the upland area continuing on in streams that service municipal water sources and the Potomac River, our concerns are far more immediate in both time and distance. Well water is the only water source available in the area of the proposed zoning change and, with the exception of Fox Glen, a majority of this water is supplied by private wells. Therefore, the groundwater aquifer fulfills a critical necessity, fulfilling all needs including human consumption, household uses, and agriculture and

maintenance of livestock and horses in the immediate area around the site. The concern is that if the aquifer becomes contaminated, then the local drinking water will be fouled.

For decades now, policy makers have been using “Aquifer Vulnerability,” to set land use and water resource protection policy. Karst has very high Aquifer Vulnerability. Therefore, this industrial use is not appropriate for this land and it should not be zoned for it. The guiding documents of the WVDEP recognize this. The introduction to the WVDEP document Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.”

The Chesapeake Bay Stormwater Network karst stormwater guidance document the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed, which the WVDEP cites in its own guiding document Stormwater Management Design in Karst Areas, clearly agrees stating:

“First, the effect of land development on karst terrain is complex and hard to predict, and requires professional analysis to reduce the risk of geological hazards, damage to infrastructure and groundwater contamination.” “The working group acknowledges that past approaches to stormwater and land development in karst terrain have been inadequate to safeguard the public and the environment.” “...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” We clearly need stronger comprehensive land use plans and zoning that direct new growth away from karst areas to more appropriate locations. Ordinance #2017-302 is literally the opposite of this.

Further, we cannot rely on the WVDEP to do the job that good local land use guidelines and zoning should do. For example, the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed states that detention and retention ponds are not recommended on karst and categorize them as discouraged. Also, quoting WVDEP’s own karst guidance: “attenuating surface runoff will increase the rate of sinkhole formation and potential groundwater contamination.” Yet the entity currently planning to utilize this zoning change is planning employment of multiple massive retention ponds and attenuating surface runoff completely. This has already been approved by the DEP in two Construction Stormwater General Permit registrations for that company. One of detention ponds is not even regulated by the DEP as it contains process water and has no outlet. Clearly the DEP recognizes the risks but is not appropriately limiting them. Relying on the DEP to protect the public health, safety, welfare, and the environment from any entity in these karst locations is simply as the CNS bulletin said it “inadequate to safeguard the public and the environment.” We must have appropriate zoning that takes into consideration appropriate use of land with karst hydrogeology. Ordinance #2017-302 does not do this, but instead increases the risk to the public and the environment.

A second serious concern is the air emissions from the industry that this zoning will provide for. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. These types of air emissions have been shown to increase the risk of, contribute to, and exacerbate a multitude of developmental, physical, physiological, physiological, cognitive and economic. The exposure of one individual can cause repercussions in multiple generations. Embryos, fetuses, and children are most vulnerable with effects born out over a lifetime, and that of their offspring. Many of these effects only require short-term exposure and some have even been shown to occur at levels below current limits recommended by the World Health Organization. One example of this is that a recent study found that “Even within the limits set by the World Health Organization, the pollutants PM₁₀, SO₂, NO₂, and O₃ are associated with increased risk of treatment for respiratory diseases in children 0 to 6 years of age.” Unfortunately, the US limits are higher than WHO, 300 % higher in the case of PM₁₀!

In fact, in 2019, in the Advice from the Independent Particulate Matter Review Panel (formerly U.S. EPA Clean Air Scientific Advisory Committee Particulate Matter Review Panel) on EPA’s Policy Assessment for the Review of the National Ambient Air Quality Standards for Particulate Matter, it stated that the committee unanimously and unequivocally found that the current primary annual and 24-hour PM_{2.5} National Ambient Air Quality Standards (NAAQS) are not adequate to protect public health. The advice from this 20-member committee, whose scientific disciplines include epidemiology, medicine, toxicology, air quality measurement, air quality modeling, exposure assessment measurement and modeling, risk assessment, statistics, and others, was ignored due presumably to political pressure. Not only are the NAAQS too high in some cases, but due to the measure and mechanism by which they work, they can not replace the safety provided by good land use and zoning regulations, that are meant to do things like keep factories with air emissions and hundreds of heavy trucks away from elementary schools. In fact, there is a state law that prohibits siting a school near a factory. Unfortunately, the reciprocal law does not exist. Clearly, just like with the water resources, we cannot rely on the DEP or the EPA to do the job of what appropriate zoning should do. The whole point of zoning is to keep people safe and provide for their health and welfare. Ordinance #2017-302 puts families and school children directly in harms way.

The air emissions, threat to the groundwater, and the very presence of the industry that this zoning change will allow for will have a serious negative economic effect on those who live and or work closest to the site in question. Productivity and workforce participation will be negatively affected by the health effects of the air emissions. The local agricultural operations will be negatively affected by the air emissions with lower quantity and quality of crop yield and would be devastated if the ground water aquifer were fouled. The equine operations in the area, of which there are several, will be negatively affected by the air emissions as they affect the horses’ health and performance. The mere presence of the industry that will be provided for by this zoning change will cause property values to fall. There will be serious economic consequences for the immediate area around the site in question.

Several of the communities in the immediate area of the site for proposed zoning change are traditionally underserved and have lower economic status. The choice of this location for such a zoning change represents an egregious example of environmental injustice that should not be promulgated or tolerated.

This zoning change will provide for industry that will negatively affect the health safety and welfare of our community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Susannah Mayo Buckles

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

As a resident of Jefferson County living less than 4 miles from the Rockwool site, I am outraged that this zoning change is being considered. Our own state government does not allow schools to be built next to heavy industry, but somehow in this case the opposite is allowed?

The gall of the City of Ranson and its "shoestring annexation" to decide that they will subject the citizens of Jefferson County to the increased air pollution and potential water contamination that Rockwool would bring us beyond comprehension. Have we learned nothing from DuPont? 3M? Freedom Industries?

I respectfully ask you to vote NO on Ordinance #2017-302. The industry this zoning change will allow for endangers the health, safety and, welfare of the community, and violates the premise of the smart code zoning that we have spent so much time, effort and federal money employing.

Any change in zoning needs to align with the comprehensive plan. In Ranson's current comprehensive plan (2012), the city only refers to "heavy industry" in the history section. Here it is characterized as part of a bygone era that has been replaced by an emphasis on agriculture for local food production, open spaces, and quality-of-life. In the remainder of the document, the word industry is used loosely to describe businesses including flower shops and shoe stores. Nothing that resembles the industry that this zoning change will provide for is described in the current comprehensive plan of Ranson.

In the land use section of the comprehensive plan, number ten states:

"Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The comprehensive plan clearly states that the city will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community. This change in zoning clearly negatively affects the health, safety, and welfare of the community.

As the zoning is proposed, the industry that this zoning change will allow for will be directly across the street from houses, parks and other small businesses. A densely populated subdivision and an elementary school already exist directly across the street. While these latter community sections are not in the city limits, the effect of this zoning on them should still be considered just the same as it would be if they were in the city limits.

The industry that this zoning change will provide for will produce particulate, gaseous, and hazardous air emissions. These emissions have been shown to be detrimental to human health at every stage of life from embryo to old age. In utero and childhood exposure are the most damaging with lasting effects being realized through out life, and with maternal exposure the effects can be felt for generations. Multiple organ systems are affected including respiratory, cardiovascular, neurologic, immune, and endocrine causing defects in multiple processes including in utero development, neurodevelopment, immune and tolerance development, and cognitive defects. There are also psychological, social, and economic effects from both perceived and actual air pollution in both children and adults. Many of these effects can be seen even with short-term exposure or exposure that is lower than the levels recommended by the US Environmental Protection Agency and World Health Organization. These consequences are devastating to the individual and depressing to the local community and economy. State law does not allow a school to be built next to industry that this zoning will allow but yet we are contemplating changing the zoning so this industry can build next to a school. This does not make sense. As Ranson residents, we want Ranson to follow the lead of the state and keep polluting industry away from kids. In these ways, this change in zoning will negatively affect the health and welfare of the community.

In addition to the health effects of the air emissions is the threat to groundwater from the industry that this zoning change would allow. The land in question has karst hydrogeology and therefore very high aquifer vulnerability and is not appropriate for this industry. With the type of industry this zoning will provide for, combined with high aquifer vulnerability, the likelihood of groundwater contamination is too high for the community and region to bear. A USGS study demonstrated that contamination in the groundwater adjacent to the site moves relatively quickly and can be found in wells and surface water structures in a variety of locations in the County. In this way, contamination at the site would affect the drinking water of the great majority of Jefferson County residents. Through the surface water connections, the water at the site also affects the water resources of the region.

Aquifer vulnerability has been used by policy makers for decades to set land use regulations. The guiding document, from the WVDEP, Stormwater Management Design in Karst Areas states, "it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in

these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” In Ranson, we need to follow this advice and not change the zoning of this land for use by industry that has among the highest aquifer vulnerability in the County. This zoning change will endanger the safety of the community and region by endangering the safe water resources. As Ranson residents, we want to safeguard the water resources of the county and region by following the WVDEP guidance here.

Further, by reallocating this transect district and replacing it with a monolithic block of Special District Industrial designation, hundreds of housing units, parks and space for small businesses are lost. Ranson loses the potential for property tax on these properties and their improvements, Business and Occupational tax on the businesses and sales tax in retail stores. The community loses out on the opportunity to develop affordable housing and create locations where people can live, work, play, and shop all in the same place reducing the need for travel.

Worse yet apparently a deal has been made where the entity that owns the subject land has required that a litany of things not be built on the adjacent land essentially stripping the purpose of the smart code transect zone that exists there. Transect zones in the smart code are meant to transition, from out to in, and provide communities where people can safely work and live in close proximity in an effort to reduce travel. Excluding many of the components of the transect zone effectively eliminates the features that make it a transect zone, thus, losing the benefits a transect zone offers the community and city. By losing these benefits, reducing the overall and affordable housing prospects, and reducing so drastically the opportunities for city income, this zoning change will negatively affect the welfare of the community.

As Ranson residents, we find it odd that we are changing zoning to provide for industry that we would not put in the middle of our town close to our residents, but we are placing it close to the homes of county residents. Further, it is striking that the area where this change in zoning is directly adjacent to historically underserved lower income communities and a Title I school. This amounts to environmental injustice and cannot be tolerated.

The purpose of zoning is for a city to protect the health, welfare, morals and safety of the community. In this case, the air emissions and heavy truck traffic will endanger the communities' health. The threat of water contamination will endanger the safety of the community. The effect of lost productivity and decreased workforce participation due to increased illness and the negative effect the air emissions and presence of such a factory will have on the local economy will negatively affect the welfare of the community. The environmental injustice of changing the zoning to accommodate such polluting industry in a location where your municipality has no residents, but yet hundreds of low income and underserved county residents live is egregiously amoral. This must not happen. We respectfully implore you to do the right thing and vote no on ordinance #2017-302.

Sincerely,

Leanne Cobb

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Matt Meade

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask you to vote NO on Ordinance #2017-302. The industry this zoning change will allow for endangers the health, safety and, welfare of the community, and violates the premise of the smart code zoning that we have spent so much time, effort and federal money employing.

This zoning change will provide for industry that will negatively affect the agriculture industry in Jefferson County and beyond. The combination of the air emissions and threat to the ground water resources could have devastating consequences for the agricultural community of Jefferson County.

The comprehensive plan of Ranson is clear: it states, "the City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community." This land is ill-suited for an industrial facility due to its location and hydrogeology. Further, the industry that this zoning change will allow for will adversely affect the health, safety, and welfare of the community through its affect on the agricultural industry.

The agriculture industry in Jefferson County is hundreds of years old and continues to serve our community well today. According to the economic impact study "A Shared Agenda for Growing West Virginia's Agricultural Economy, Prepared by Fourth Economy for West Virginia Department Of Agriculture West Virginia University Extension Service 2012," Jefferson County is the second highest producing county for crops sales, third highest for fruits and vegetables sales, and in the top 9 counties for sales of animals and animal products.

Agriculture, tourism and the equine industries work synergistically to have an outsized positive impact on the economy in Ranson and Jefferson County as a whole. Agriculture drives tourism by creating agro-tourism opportunities, preserving beautiful open spaces that contribute to the

bucolic nature of our county, and providing the locally produced agriculture goods many tourists are look for in our markets and restaurants. Agriculture also supports the equine industry by providing local products like hay and straw, helping maintain pasture land, co-supporting local dual-purpose retail stores, and helping recycle by products. Agriculture helps maintain the way of life that many those who choose to live in Jefferson County enjoy. Industrial manufacturing and industry this zoning will provide for could never achieve these things.

Local agriculture also provides a source of locally produced agricultural goods. It has become apparent with the current pandemic and health emergency. This became a supply chain crisis because as our supply chains have moved to be ever more lean and efficient they lack resiliency and agility. By having a local source of agricultural goods and food we add resiliency and agility into our own economy and community. The agricultural industry in Jefferson County provides this.

A plethora of scientific studies have shown that a variety of air pollutants produced by the type of industry this zoning change would provide for causes decreased yields of both quantity and quality for several of the crops important to Jefferson County including winter wheat and soybeans. Soybeans and wheat are two of the crops significantly affected and two of the most prevalent crops in Jefferson County. Lower crop yields harm the farms and all the members of the down stream supply chain as well as the consumer. In this way, this zoning change will adversely affect the welfare of the community.

Recent studies have shown that even small increases in air pollution affect the productivity of agricultural workers. Similar to the reduction in crop yield this will negatively affect the individual workers, businesses, consumers and industry as a whole. In this way, this zoning change will adversely affect the health and welfare of individuals and the community.

Even more devastating is the possibility of groundwater contamination. The land at the subject location has karst hydrogeology and as such has porous bedrock and severe ground instability problems. The porous bedrock allows rapid diffuse infiltration of surface water into ground water and the severe ground instability problems leads to sinkhole development. Sinkholes provide direct connection of the surface water with the ground water aquifer through point infiltration. In fact, according to a 2012 study by Doctor and Doctor, the subject location and that of Terrapins Neck have the highest sinkhole vulnerability of any sites in Jefferson County. The propensity and easy of diffuse and point infiltration in areas of karst hydrogeology give them very high aquifer vulnerability meaning the aquifer is very vulnerable to contamination. For this reason, this measure has been used for decades by policymakers to set land use regulations. In this way, this zoning change and the industry it will provide for will adversely affect the welfare of the community.

The WVDEP recognizes development in car karst areas puts water resources high-risk for contamination but also recognizes that this is best protected against true local land use and zoning ordinances. WVDEP's guiding document Stormwater Management Design in Karst Areas

states, "it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." This document also references the Chesapeake Bay Stormwater Network karst stormwater guidance document the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed. In which it states "...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." Land use policy in Ranson and zoning need to take aquifer vulnerability into consideration as these agencies and documents suggest.

The Jefferson Orchards Voluntary Remediation Plan application reports that the ground water is only 60 feet from the surface at the site. It is described in the scientific literature that this land is an upland plane with large amounts of water in the epikarst, and contamination of this water effects the whole aquifer including the communications with surface water streams. A USGS study demonstrated that the groundwater adjacent to the site communicates readily with several surface water structures and wells miles away from the site. The effects of contamination at this site would go well beyond Ranson fouling large portions of the ground water and surface water in Jefferson County.

Groundwater contamination at the site would have devastating effects on the Agricultural industry in Jefferson county. For geographic and economic reasons it is simply infeasible for the agricultural industry to rely on utility provided water. Based on the scientific literature the site being considered for rezoning is one of the areas of highest aquifer vulnerability in Jefferson County and is inappropriate for the industry that this zoning change will provide for. This land is clearly ill-suited for industrial use and should not be zoned for it.

By threatening the local agricultural industry, the industry that this zoning will provide for will threaten the health, safety, and welfare of the community, and this land is not well-suited for industrial use. The Comprehensive Plan in Ranson is clear the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

William Veldran

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. Also, it will adversely affect our environment including our drinking water, our equine industry, agriculture, and tourism. It will be a blight on our landscape to see the huge smokestacks from just about every direction. The smokestacks will be spewing pollution. The surrounding areas will be assaulted by huge heavy cargo trucks running up and down the roads also polluting the environment. The air we breathe will be polluted. And all of this within close proximity to schools. It is an easy choice to oppose industrialization. It is a difficult choice if you don't have the strength of your convictions. Please do what is right and vote NO.

Sincerely,

B.H.

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

As a resident of Loudoun County, an environmental and civil engineer working in the public sector, I respectfully request that you vote no on #2017-302. As a professional that has worked in both the public and private sector, I understand the delicate balance between development and balancing public concerns and welfare. However, after hearing and seeing the public distaste for this project (going beyond the typical "not in my backyard" outcry) and the very valid environmental concerns, I urge you to vote no on this zoning modification. Zoning modifications should not be made hastily and should be fully researched, understood and vetted before being approved. They should also be made with the support of the community and should only be approved if the benefits to the public good strongly outweigh the costs. This is not the case with this modification request.

This zoning change will provide for heavy industrial activities that will negatively effect the health safety and welfare of Ranson, Jefferson County, Loudoun County and the surrounding areas. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." To achieve this the council must not approve this proposed zoning change.

Please keep Ranson and West Virginia "wild and wonderful", please vote no on the ordinance #2017-302.

Sincerely,

Christine Roe

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Lisha Simester

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that will significantly harm the municipalities within Jefferson County and beyond effecting the health, welfare, and safety of our community. Harpers Ferry is a national treasure with the natural and historic resources tours flock to see each year and one of the communities that will be negatively impacted by this zoning change.

According to a 2019 study by the West Virginia Tourism Office, Jefferson County generated an average of \$178 million per year in tourism-derived revenue for state and local governments over the last 10 years, more than any other county in West Virginia by at least double. Tourism benefits the businesses and economy of Ranson and Jefferson County producing \$213.7 million in individual earning, 7040 jobs, and \$842.6 million in direct spending here in 2018. We would need 40 Project Shuttles to replace the individual earnings and 59 Rockwools to replace the jobs provided by the tourism industry in Jefferson County. It is important to note that most of the money generated by tourism in Jefferson County comes from neighboring states. In this way, it is like an export: not simply recycling money, but bringing money into the state increasing its wealth. Much of the economy in Harpers Ferry is based on this tourism industry. A threat to this industry poses a threat to the economy and welfare of our community.

One of the important drivers for tourism in Harpers Ferry is the Appalachian Trail. According to the Appalachian Trail Conservancy (ATC), Harpers Ferry is the psychologic midpoint of the Trail, and hikers often plan extended stays in Jefferson County with an obvious positive impact. The ATC reports that the smokestacks and associated lights will be visible in the viewshed of 15 vistas on the Appalachian Trail (AT). Studies have shown that quality of vistas and human impact on the environment are not only noticed by visitors, but effect their experience. Another study published in the Journal of Applied Recreation Research, found that points of interests and views drew visitors' attention and had a significant impact on their perception of the trail. It was also found that particularly beautiful vistas helped visitors overlook elements

that usually have a negative effect on trail experience like increased trail traffic. A 2009 study in Leisure Sciences revealed that scenic value was a perceptual theme of Appalachian Trail visitors, and that things as simple as dead trees visible in a vista can have a negative impact on visitors' overall perception. Imagine the effect the smokestacks will have from the 15 vistas from which they will be visible. The introduction of industrial activity made possible by the proposed rezoning in Ranson would have a negative effect on the scenic views of beautiful landscapes from the Appalachian Trail in Jefferson County.

The smokestacks are not all visitors will be able to see — the air pollution will create haze. The effect of regional haze on tourists was explored in a review article published in the Atmospheric Environment titled "Impaired visibility: the air pollution people see." A key takeaway on the negative affect of haze on vacationing tourists was summarized as follows:

"Vacations offer an escape from the routine and stress of our daily lives. Vacation destinations are often chosen based on their scenery; vacations are spent gazing at monuments, mountains, clouds, and oceans. Good visibility allows clear observation of distant features and appreciation of the inherent beauty of these scenes...Air pollution, which is often present in both our cities and parks, interferes with these attributes and can ruin the views vacationers travel to enjoy."

People seek bucolic, unspoiled areas to escape the stresses of urban areas. A 2004 study in Environment and Behavior found perceived pollution causes stress while viewing natural scenes has both psychological and physiological benefits, and a 2007 study confirmed these benefits. Two other studies found that people are emotionally affected by poor visibility, and tourists are disappointed when views are obscured by haze.

The combination of smokestacks and haze will mar the viewshed and will not only reduce the positive effects of a scenic landscape but also leave tourists disappointed and dissatisfied with their choice of destination. With these effects the welfare of the Harpers Ferry community would undoubtedly be endangered by the industry that this zoning change will provide for.

Multiple studies by doctors Kozar, Doctor, and Doctor have demonstrated that the land at this site to be rezoned is Karst with the highest likelihood of sinkhole development in the county, and that the groundwater aquifer there is incredibly sensitive to contamination from surface water. Further, this site is on an upland plain with relatively few surface streams, seasonal variability in the water table that results in numerous estavelles, and large amounts of water in the epikarst. In this area contamination in surface water communicates easily to the water in the epikarst via diffuse and point infiltration, and the springs at the margins of the upland area are directly affected by the water quality throughout the aquifer. According to Jefferson Orchards Voluntary Remediation Plan with the WVDEP, the groundwater at the site is approximately 60 feet below the ground, and the tests performed by the USGS have shown that groundwater from just adjacent to this site emerged in the headwaters of both the Elk's Run and Rattlesnake Run. This is critically important for Harpers Ferry because the Elk's Run headwaters is a spring about three miles southeast of the site and goes on to become the drinking water source for Harpers Ferry and Bolivar before emptying into the Potomac River.

The headwaters of Rattlesnake Run is a spring about 3.5 miles from the site and is also a tributary of the Potomac River. The Potomac River is the back up water source for Harpers Ferry. This means that the activity at the site will have a critical influence on the drinking water of Harpers Ferry. In this was the industry permitted by this change in zoning would undoubtedly endanger the health and safety of the community in Harpers Ferry.

The untoward health effects and individual economic consequences from the pollution emissions of the industry this rezoning will allow that will be born out over the length of people's lives and that of their decedents for at least three generations is an egregious example of environmental injustice that should not be tolerated. This zoning change may be in one of the poorest sections of the county, but the effects will be felt in every part of Ranson and the county.

The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." The industry that this rezoning will allow will jeopardize the health, safety and welfare of Ranson, Harpers Ferry and the whole county. Please vote no on the ordinance #2017-302.

Sincerely,

Linda Roberts

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would have a negative effect on water and air quality in neighboring states such as Maryland.

The Potomac River provides drinking water and a source of recreation to Maryland residents. Water and air pollution generated within the Potomac River's watershed will inevitably contaminate this valuable waterway. The site of the proposed zoning change in Ranson is located within the Potomac River Watershed.

The type of industry that ordinance #2017-302 would allow in Ranson would utilize large water impoundments, in an area of known karst terrain. This water will be contaminant from several sources including particulate mater that has fallen out from the air emissions and process water. The West Virginia Department of Environmental Protection has published guidelines that specifically discourage extensive development in areas of karst terrain because of the vulnerability of karst aquifers to contamination by surface pollution. Karst features increase surface water and groundwater connectivity and any spills or surface releases quickly percolate into the groundwater. Additionally, sinkholes are common in karst terrain and can cause ruptures in wastewater impoundments. Even if appropriate attempts are made to contain and manage wastewater and other stormwater runoff on-site, there is still a high risk that wastewater could contaminate the groundwater through tears and catastrophic failure of wastewater impoundments. Contaminated groundwater in karst terrain can easily resurface in waterways several miles away, as shown by a USGS tracer study conducted near the site in to be rezoned. The USGS study detected tracer dye in multiple springs and waterways miles from the initial injection site in Ranson. All of these waterways drain into the Potomac River.

Mismanagement of wastewater could also lead to contamination of nearby surface waters. For example, the site of the proposed rezoning in Ranson is in the Rocky Marsh Run watershed.

Rocky Marsh Run also drains to the Potomac River. Voting no on ordinance #2017-302 will preserve downstream water quality and help ensure that the Potomac River remains usable for Maryland residents.

Air pollution poses another risk to Maryland residents. The type of industry that ordinance #2017-302 would allow would generate air pollutants like fine particulate matter. According to the US EPA, fine particulates can travel 100s of miles from its original source. Air pollution related to industrial activity in Ranson could easily reach Maryland. Fine particulates have a greater affinity for carrying toxic compounds and their small size allows them to be inhaled more deeply into the lungs. Chronic exposure to fine particulate matter is associated with increased risk of several diseases including Alzheimer's in adults. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease among others. Fine particulate matter also exacerbates regional haze which creates a visible reminder of air pollution. The psychological effects that arise from an increased perception of pollution include stress, anxiety, and unhappiness. Voting no on ordinance #2017-302 will help prevent increased air pollution from negatively affecting the long-term health of Maryland residents.

The industry that this zoning will provide for will threaten the health, safety, and welfare of the residents in Maryland, and this land is not well-suited for industrial use. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." To achieve this, the council must not approve this proposed zoning change.

I again request that you vote no on ordinance #2017-302. Zoning decisions in Ranson and Jefferson County have an undeniable influence on the quality of life in neighboring states.

Sincerely,

Theresa Smith

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Dawn Rodgers

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote NO on Ordinance #2017-302. This rezoning will put an undue hardship on the wastewater treatment systems, burden the rate payers and risk surface waterways in Charles Town, risking the health, safety and welfare of the community. The comprehensive plan of Ranson states, the City "will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community." Therefore, please vote NO on #2017-302.

The nature of the industry that this zoning will allow will be harmful to our local economy. Charles Town has spent a lot of time and money improving our downtown area for restaurants and retail. We are working to take advantage of the tourism industry in our county and bring more people into Charles Town. The eye sore, noise pollution, air pollution, and obvious move away from sustainability will drive people away from Jefferson County and Charles Town, rendering our efforts ineffective and unrewarding. This will make it harder for our small businesses to be successful. In this way, the industry this zoning will provide for will adversely affect the welfare of our community.

According to the 2018 WVU economic study of the eastern panhandle, over 40% of the workforce in Jefferson County choose to work outside of the state. These commuters bring that money home and spend it here supporting our local small businesses, economy and government. Charles Town has a large number of residents who commute. These typically higher earners may choose to leave the area because of the presence of the industry that this zoning change would provide for. This will cause a hardship on our economy and municipality. In this way, the industry this zoning will provide for will adversely affect the welfare of our community.

The industry that this zoning will allow will cause stress for multiple reasons on the Charles Town wastewater treatment systems and the surface waterways in Jefferson County and

beyond. The industry currently planning to utilize the zoning change will have discharge to the wastewater system that is high in chloride, primarily from its water softening system. The NPDES permit modification allows up to 5,000 mg/L. Chloride is not settled or removed at the wastewater treatment plant. It cannot be removed by conventional means and would be prohibitively expensive to do by new technology. This is of concern to Charles Town because chloride can harm stream water and also impair functioning of the wastewater treatment plant. Furthermore, the corrosive nature of chloride can cause damage to pipes both in the wastewater system and those used by downstream drinking water systems, like the \$207 million Trap Rock Water Treatment plant in Loudoun.

The human health criteria for chloride under WV standards is 250 mg/L. Under low stream flow conditions, chloride additions to the treatment plant effluent, as proposed by the industry currently planning to utilize the zoning change, could cause chloride levels in Evitts Run to exceed this standard. If the amount of chloride increased due to expansion or higher throughput, then this human health standard would be violated frequently. Chlorides are also known to harm aquatic life and effect metal toxicity in rivers. The USEPA and several states have surface water guidelines of 230mg/L for chronic exposure. This would also pose a risk of damaging the water treatment facilities downstream on the Potomac River.

A research study by Lefebvre and Moletta in 2006 showed that chloride and salinity impair the ability of wastewater treatment to remove phosphorus and nitrogen, and because of this, other states have introduced legislation to treat saline wastewater. Uygur and Kargi in 2004 looked at the effects of salt on synthetic wastewater treatment. They found that removal of both nitrogen and phosphorus was reduced when salinity increased from 0 to 6%. In fact, the removal efficiency of ammonia dropped from 96% to 39% with this increasing salinity. Hong et al. In 2016 found phosphorous removal decreased 20-28% when chloride concentrations went from 150 mg/L to 1,500 mg/L. Phosphorous removal was completely inhibited at concentrations greater than 2,500 mg/L. This increased salinity has the potential to make the Charles Town wastewater treatment system work far less efficiently.

In addition to the contents of the wastewater this type of industry will produce, the volume of sewage is itself a concern. Given that the City of Charles Town has been in violation of its permit on numerous occasions for spills and overflow of untreated sewage, adding large volumes of wastewater will further challenge the near capacity system. This will mean that costly capacity upgrades will need to be done likely sooner than they would have needed to be done, imposing further financial strain on the system. Through these effects, the industry this zoning will provide for will adversely effect the health, safety, and welfare of the community.

This zoning change will provide for industry the likes of which are not present in this county and have not been present in this county for many decades. We find it appalling that the introduction of zoning for such industry is being done in an area of the county that is historically underserved and lower income. It is even more egregious because the worst effects including air pollution and groundwater contamination will be felt first and most severely in the immediate vicinity, and Ranson does not even have residents in the immediate vicinity of the

proposed zoning change. This decision is being contemplated without representation of those who will be most affected. This would be a deplorable example of environmental injustice.

This zoning will provide for industry that will harm our economy, drive away residents, challenge and or damage our infrastructure, and may damage our waterways and wild life. Through these effects, the industry this zoning would allow will adversely effect the health, safety, and welfare of our community. This is being done with out representation of those it will affect the most. Please vote No on Ordinance #2017-302.

Sincerely,

Teresa Collins

To: spfaltzgraff@ransonwv.us; dpierson@ransonwv.us; gtaylor@ransonwv.us; scoulter@frontiernet.net; tgrant@ransonwv.us; astroud@ransonwv.us; andersonantS@aol.com; donhainessr@gmail.com
Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would put at risk the health and well being of children of Jefferson County.

The type of industry that ordinance #2017-302 would allow in Ranson would generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. Exposure to these pollutants has devastating effects on children's health. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. Developing fetuses whose mothers are exposed to air pollution are more likely to have impaired organ development which can lead to early cognitive deficits, neurodevelopmental defects and other physical, cognitive, and psychological deficits later in life. An association between autism and prenatal exposure to particulate matter in air pollution has been demonstrated in several studies. Many studies have shown that lower test scores in math, English, and language arts are associated with exposure to outdoor air pollution. Industrial activity allowed by ordinance #2017-302 would also increase the risk of groundwater contamination in Ranson and nearby municipalities. Children whose families rely on well water, as is the case in much of Jefferson County, may be affected by polluted water. Voting no on ordinance #2017-302 will prevent air and water pollution from negatively affecting the long-term health of children in Jefferson County and surrounding areas.

The economic and environmental harm caused by the type of industry that ordinance #2017-302 would allow would put additional stress on the parents, caretakers, and teachers of children in affected areas. The weakening and destabilizing of this support network would have negative effects on local children. Many households in Jefferson County depend on the local agriculture, tourism, and equine industries for income. If industrial activity in Ranson depresses these industries, the resulting financial strain on these households will introduce additional stress and uncertainty into children's lives. Households living in areas affected by particulate

matter and regional haze will also suffer from the psychological effects of air pollution. Individuals living in areas with increase perception of pollution show increased levels of stress, anxiety, and unhappiness. School districts affected by increased air and water pollution may have trouble recruiting and retaining teachers. Teachers have a large influence on a child's daily life and, if educator quality and tenure decreases, the quality of this influence will diminish.

The site of the proposed rezoning in Ranson is across the road from an elementary school and proximal to lower-income neighborhoods. Observations like these demonstrate how ordinance #2017-302 would disproportionately affect vulnerable and historically-disadvantaged populations. The damaging health effects of air pollution have been shown to persist for at least three generations, so allowing certain types of industry in low-income areas would only compound existing disadvantages. Voting no on ordinance #2017-302 would be a step towards acknowledging that all individuals have the right to clean air and water.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." This zoning change would clearly adversely affect the health, safety, and welfare of the community. Children face increased exposure to air pollution adversely affecting their health, financial instability adversely affecting their welfare, groundwater contamination adversely affecting their safety, and environmental injustice and discrimination if ordinance #2017-302 is passed. Educators will face increased air pollution adversely affecting their health and consequently welfare. These adverse effects are all against Ranson's Comprehensive Plan. Please vote NO on Ordinance #2017-302.

Sincerely,

Amanda Groff

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would negatively affect tourism, economic agility, groundwater quality, and individual health in neighboring municipalities like Shepherdstown. In doing these things the industry that this zoning change provides for will adversely affect the health, safety, and welfare of our community.

Tourism is critically important to Shepherdstown's economy and to the county as a whole. In 2018, tourist spending in the Jefferson County contributed over \$170 million to state and local government revenue and \$213 million in individual earnings. Importantly, most of this money comes from tourists visiting from neighboring states like Virginia, Maryland, and Washington D.C. Out-of-state tourists are largely drawn to Jefferson County because of its reputation for environmental-friendly, sustainable industry. Key elements that support this reputation include the county's pastoral scenery and pristine natural resources. Ordinance #2017-302 will allow industry into Jefferson County that risks harming these elements and dramatically reducing the area's appeal to visitors. The resulting harm to our tourist industry would drive away visitors and decrease state, county, and local revenue. The long-term success of Jefferson County's tourism industry is dependent on local governments making coordinated zoning decisions. Allowing certain types in industry in Ranson will negatively affect tourism in every municipality throughout the county, including Shepherdstown. Voting no on ordinance #2017-302 will protect the foundations of the county's tourism industry and protect the 7,040 jobs in Jefferson County that are directly supported by tourism. In this way the industry this zoning change will allow will adversely affect the welfare of our community.

The type of large, consolidated industry that ordinance #2017-302 would allow in Ranson would generally reduce the flexibility of local economies in Jefferson County. Historically, the driving industries in Jefferson County have been tourism, agriculture, and the equine industries. These three industries are large conglomerates of small businesses. Small business is very important

to Shepherdstown. Small businesses have been shown to create more jobs, cultivate more innovation, and provide more opportunities than big, non-local firms. Additionally, small businesses have been shown to be more reactive to sudden changes relative to manufacturing businesses. Bringing large, manufacturing-based industry into Jefferson county will depress the local economy and stifle innovation. During this time of economic upheaval and uncertainty, Jefferson County needs to support industries that will allow local economies to adapt and recover as fast as possible.

Voting no on ordinance #2017-302 will help protect water resources throughout Jefferson County. The type of industry that ordinance #2017-302 would allow puts the ground resources of Jefferson county at significant risk due to the karst hydrogeology. The site in Ranson is in the Rocky Marsh Run watershed, which is in the source water protection zone for Shepherdstown and drains to the Potomac River. Therefore, activity at this site will affect both groundwater and surface water streams. In municipalities like Shepherdstown, many residents and nearby farms depend on wells for water. Contamination of groundwater aquifers would create both health and remediation concerns for local residents. Dye tests performed by the USGS near the area of proposed rezoning in Ranson have shown just how far-reaching groundwater contamination at the Ranson site could be. Results from the USGS study revealed measurable dye concentrations in Elk's Run, Rattlesnake Run, and even the Shepherdstown Town Run. This last run cuts through the center of Shepherdstown and is a favorite area for children to play and learn to fish. In this way, the industry that this zoning change will allow will adversely affect the safety of our community.

Groundwater pollution is not the only concern for communities like Shepherdstown. The type of industry that ordinance #2017-302 would allow in Ranson would also generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. These pollutants are particularly harmful to children. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. The site in Ranson is across the road from an elementary school and also within the Jefferson High Middle district. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of children in Shepherdstown and all of Jefferson County. In this way, the industry that this zoning change will provide for will adversely affect the health of our community.

I again request that you vote no on ordinance #2017-302. This zoning change will allow industry that will adversely affect the health, safety, and welfare of our community. The long-term economic, environmental, and community health of municipalities like Shepherdstown depend on Ranson's participation in a coordinated zoning plan for all of Jefferson County.

I'm from Shepherdstown, but all of Jefferson County is my home. This county and West Virginia as a whole does not need more heavy industry destroying our natural beauty and poisoning our residents. Please, vote no to protect our land and the communities that thrive there.

Sincerely,

Emilie Malcolm

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on #2017-302. The change in use, the reallocation of a transect district is not in keeping with the Comprehensive Plan. Not to mention that the air emissions, possibility of ground and surface water contamination, and their effect on our interwoven economies threaten the health, safety and welfare of not just Jefferson County but the greater region, including Loudoun and the greater Northern Virginia area.

I've read the Comprehensive Plan that governs changes to the zoning of the Jefferson Orchards site. Heavy industry is not included in the plan for the future of Ranson, except as a note that Brownfield development funds for past industrial uses will be used and these sites repurposed. The area in question is noted to be a transit hub with the potential for light industry to make use of the rail line in a mixed use development. Creating a Special District at this location to allow a heavy industrial use seems completely contrary to the plan, and unallowable under law. New proposals for amending and reallocation of transect districts must be in keeping with the approved Comprehensive Plan. What is the purpose of a Comp Plan if the City of Ranson allows new uses to be introduced that are not in keeping with it? That seems to be opening the City up to potential liability and offers the possibility that all future decisions will be looked at in a suspect way.

The current Comprehensive Plan was done with community input and was voted and passed. It discusses the unique features of the locality, including the geological limitations of development. The Jefferson Orchards site is known to have ground water that is vulnerable to contamination due to the karst hydrogeology. A USGS study demonstrated that the ground water adjacent to the site to be rezoned communicates readily with surface water tributaries of the Potomac River. In addition to direct infiltration where water moves directly from the surface to groundwater via porous limestone bedrock, karst is known to have severe ground instability problems. This makes karst geology prone to sinkhole development. Sinkholes provide direct connection between the surface water and any contaminants it may contain and

the groundwater. This makes the aquifer vulnerability in karst areas very high, and contamination with industrial activity such as that provided for by this rezoning too likely. In this way, this zoning change will adversely affect the health and welfare of individuals and the community.

I live right over the border, in Loudoun County. Loudoun sources its drinking water from the Potomac River, downstream of many West Virginia tributaries that carry water from the epikarst and groundwater aquifer at the site to be rezoned. Loudoun has recently completed the new Trap Rock Water Treatment facility, which draws water from the Potomac River. Loudoun currently provides 40 million gallons and projects to provide 90 million gallons of drinking water a day to customers by 2040 (Loudounwater.org). Therefore, the viability of the Potomac River is a high priority for Virginia residents.

Loudoun and Northern Virginia are some of the fastest growing communities in the country and provide much in the way of support to Jefferson County in their symbiotic relationship. Virginia residents enjoy Jefferson County through tourism, as our residents enjoy the natural and historical resources of your county. Virginia residents and businesses support the equine industry in a multitude of ways from providing wagering fans at the races to the Virginia Breeders Association Virginia Certified incentive programs. According to an economic impact study from WVU, at least 40% of Jefferson County residents travel outside of West Virginia for work, a good percentage of those travel to Northern Virginia. This rezoning would allow for industry that would negatively affect the economy of both places and this relationship.

This zoning change will allow an industrial use, and this can be from multiple companies as your current owner has substantial property involved that they may sell to others. Heavy industry will negatively effect the health safety and welfare of the Loudon and Northern Virginia community. The Comprehensive Plan in Ranson is clear: the City has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. I know there is worry on the part of the Council that to vote no would open the City to liability from current property owners that will be damaged by the change and there may be political fallout. I urge you to recognize that you are open to liability if you do not follow the Comprehensive Plan as you are charged to do.

Please vote no on the ordinance #2017-302.

Sincerely,

William Pabst

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

VOTE NO Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

This is not in compliance with the 2035 Ranson plan that received fed Grants and was to be multi-purpose community living!

I respectfully ask you to vote NO on Ordinance #2017-302. The industry this zoning change will allow for endangers the health, safety and, welfare of the community, and violates the premise of the smart code zoning that we have spent so much time, effort and federal money employing.

Any change in zoning needs to align with the comprehensive plan. In Ranson's current comprehensive plan (2012), the city only refers to "heavy industry" in the history section. Here it is characterized as part of a bygone era that has been replaced by an emphasis on agriculture for local food production, open spaces, and quality-of-life. In the remainder of the document, the word industry is used loosely to describe businesses including flower shops and shoe stores. Nothing that resembles the industry that this zoning change will provide for is described in the current comprehensive plan of Ranson.

In the land use section of the comprehensive plan, number ten states:

"Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The comprehensive plan clearly states that the city will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community. This change in zoning clearly negatively affects the health, safety, and welfare of the community.

As the zoning is proposed, the industry that this zoning change will allow for will be directly across the street from houses, parks and other small businesses. A densely populated subdivision and an elementary school already exist directly across the street. While these latter community sections are not in the city limits, the effect of this zoning on them should still be considered just the same as it would be if they were in the city limits.

The industry that this zoning change will provide for will produce particulate, gaseous, and hazardous air emissions. These emissions have been shown to be detrimental to human health at every stage of life from embryo to old age. In utero and childhood exposure are the most damaging with lasting effects being realized through out life, and with maternal exposure the effects can be felt for generations. Multiple organ systems are affected including respiratory, cardiovascular, neurologic, immune, and endocrine causing defects in multiple processes including in utero development, neurodevelopment, immune and tolerance development, and cognitive defects. There are also psychological, social, and economic effects from both perceived and actual air pollution in both children and adults. Many of these effects can be seen even with short-term exposure or exposure that is lower than the levels recommended by the US Environmental Protection Agency and World Health Organization. These consequences are devastating to the individual and depressing to the local community and economy. State law does not allow a school to be built next to industry that this zoning will allow but yet we are contemplating changing the zoning so this industry can build next to a school. This does not make sense. As Ranson residents, we want Ranson to follow the lead of the state and keep polluting industry away from kids. In these ways, this change in zoning will negatively affect the health and welfare of the community.

In addition to the health effects of the air emissions is the threat to groundwater from the industry that this zoning change would allow. The land in question has karst hydrogeology and therefore very high aquifer vulnerability and is not appropriate for this industry. With the type of industry this zoning will provide for, combined with high aquifer vulnerability, the likelihood of groundwater contamination is too high for the community and region to bear. A USGS study demonstrated that contamination in the groundwater adjacent to the site moves relatively quickly and can be found in wells and surface water structures in a variety of locations in the County. In this way, contamination at the site would affect the drinking water of the great majority of Jefferson County residents. Through the surface water connections, the water at the site also affects the water resources of the region.

Aquifer vulnerability has been used by policy makers for decades to set land use regulations. The guiding document, from the WVDEP, Stormwater Management Design in Karst Areas states, "it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." In Ranson, we need to follow this advice and not change the zoning of this land for use by industry that has among the highest aquifer vulnerability in the County. This zoning change will endanger the safety of the community and region by endangering the safe water resources. As Ranson residents, we

want to safeguard the water resources of the county and region by following the WVDEP guidance here.

Further, by reallocating this transect district and replacing it with a monolithic block of Special District Industrial designation, hundreds of housing units, parks and space for small businesses are lost. Ranson loses the potential for property tax on these properties and their improvements, Business and Occupational tax on the businesses and sales tax in retail stores. The community loses out on the opportunity to develop affordable housing and create locations where people can live, work, play, and shop all in the same place reducing the need for travel.

Worse yet apparently a deal has been made where the entity that owns the subject land has required that a litany of things not be built on the adjacent land essentially stripping the purpose of the smart code transect zone that exists there. Transect zones in the smart code are meant to transition, from out to in, and provide communities where people can safely work and live in close proximity in an effort to reduce travel. Excluding many of the components of the transect zone effectively eliminates the features that make it a transect zone, thus, losing the benefits a transect zone offers the community and city. By losing these benefits, reducing the overall and affordable housing prospects, and reducing so drastically the opportunities for city income, this zoning change will negatively affect the welfare of the community.

As Ranson residents, we find it odd that we are changing zoning to provide for industry that we would not put in the middle of our town close to our residents, but we are placing it close to the homes of county residents. Further, it is striking that the area where this change in zoning is directly adjacent to historically underserved lower income communities and a Title I school. This amounts to environmental injustice and cannot be tolerated.

The purpose of zoning is for a city to protect the health, welfare, morals and safety of the community. In this case, the air emissions and heavy truck traffic will endanger the communities' health. The threat of water contamination will endanger the safety of the community. The effect of lost productivity and decreased workforce participation due to increased illness and the negative effect the air emissions and presence of such a factory will have on the local economy will negatively affect the welfare of the community. The environmental injustice of changing the zoning to accommodate such polluting industry in a location where your municipality has no residents, but yet hundreds of low income and underserved county residents live is egregiously amoral. This must not happen. We respectfully implore you to do the right thing and vote no on ordinance #2017-302.

Sincerely,

Brian Palank

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Stephen Hendrickson

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. To attempt to correct a procedural error that didn't allow for these comments previously is dubious. Additionally, the type of industry that this ordinance would allow in Ranson would negatively affect tourism, economic agility, groundwater quality, and individual health in neighboring municipalities like Shepherdstown. In doing these things the industry that this zoning change provides for will adversely affect the health, safety, and welfare of MY community.

As a 32 year resident of Jefferson County, I have watched the area grow and thrive around local businesses and bedroom communities. I am just as eager as others to see businesses begin to grow in the area, but not the type that this would allow. We need to focus on professional jobs in a changing economy instead of heavy polluters who would not be willing to put these same plants near their own homes.

Additionally, as the recent COVID-19 pandemic has shown, a move to more rural communities like ours will increase the potential for growth and economic development around professionals who will work from home like I do. The quality of air and the health benefits of being outside the city are part of the reason I don't move closer to my home office. The approval of this zoning would negatively affect my ability to be more active outside.

As a 10-year resident in Shepherdstown, I know that tourism is critically important to Shepherdstown's economy and to the county as a whole. In 2018, tourist spending in the Jefferson County contributed over \$170 million to state and local government revenue and \$213 million in individual earnings. Importantly, most of this money comes from tourists visiting from neighboring states like Virginia, Maryland, and Washington D.C. Out-of-state tourists are largely drawn to Jefferson County because of its reputation for environmental-friendly, sustainable industry. Key elements that support this reputation include the county's pastoral scenery and pristine natural resources. Ordinance #2017-302 will allow industry into Jefferson

County that risks harming these elements and dramatically reducing the area's visual appeal to visitors.

The resulting harm to our tourist industry would drive away visitors and decrease state, county, and local revenue AND WOULD NOT BE OVERCOME BY THE INDUSTRY ITSELF based on other sweetheart deals on taxes and fees the county is NOT imposing.

The long-term success of Jefferson County's tourism industry is dependent on local governments making coordinated zoning decisions. Allowing certain types in industry in Ranson will negatively affect tourism in every municipality throughout the county, including Shepherdstown.

Voting no on ordinance #2017-302 will protect the foundations of the county's tourism industry and protect the 7,040 jobs in Jefferson County that are directly supported by tourism. In this way the industry this zoning change will allow will adversely affect the welfare of our community.

The type of large, consolidated industry that ordinance #2017-302 would allow in Ranson would generally reduce the flexibility of local economies in Jefferson County. Historically, the driving industries in Jefferson County have been tourism, agriculture, and the equine industries. These three industries are large conglomerates of small businesses. Small business is very important to Shepherdstown. Small businesses have been shown to create more jobs, cultivate more innovation, and provide more opportunities than big, non-local firms. Additionally, small businesses have been shown to be more reactive to sudden changes relative to manufacturing businesses. BRINGING LARGE, MANUFACTURING-BASED INDUSTRY INTO JEFFERSON COUNTY WILL DEPRESS THE LOCAL ECONOMY AND STIFLE INNOVATION. During this time of economic upheaval and uncertainty, Jefferson County needs to support industries that will allow local economies to adapt and recover as fast as possible.

Voting no on ordinance #2017-302 will help protect water resources throughout Jefferson County. The type of industry that ordinance #2017-302 would allow puts the ground resources of Jefferson county at significant risk due to the distinctive hydrology and landforms that arise from a combination of high rock solubility and well developed secondary (fracture) porosity. Such areas are characterized by sinking streams, caves, enclosed depressions, fluted rock outcrops, and large springs.

The site in Ranson is in the Rocky Marsh Run watershed, which is in the source water protection zone for Shepherdstown and drains to the Potomac River. Therefore, activity at this site will affect both groundwater and surface water streams. Living just outside of the town limits of Shepherdstown, my entire subdivision and many nearby farms depend on wells for water. Contamination of groundwater aquifers would create both health and remediation concerns for local residents - especially those like me with pre-existing conditions and compromised immune systems.

Dye tests performed by the USGS near the area of proposed rezoning in Ranson have shown just how far-reaching groundwater contamination at the Ranson site could be. Results from the USGS study revealed measurable dye concentrations in Elk's Run, Rattlesnake Run, and even the Shepherdstown Town Run. This last run cuts through the center of Shepherdstown and is a favorite area for children to play and learn to fish. In this way, the industry that this zoning change will allow will adversely affect the safety of our community.

Groundwater pollution is not the only concern for communities like Shepherdstown. The type of industry that ordinance #2017-302 would allow in Ranson would also generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. These pollutants are particularly harmful to children. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. THE SITE IN RANSON IS ACROSS THE ROAD FROM AN ELEMENTARY SCHOOL. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of children in and from Shepherdstown and all of Jefferson County. In this way, the industry that this zoning change will provide for will adversely affect the health of our community.

I again request that you vote no on ordinance #2017-302. This zoning change will allow industry that will adversely affect the health, safety, and welfare of our community. The long-term economic, environmental, and community health of municipalities like Shepherdstown depend on Ranson's participation in a coordinated zoning plan for all of Jefferson County.

Sincerely,

Martin Herbert

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Lori Robertson

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask you to vote NO on Ordinance #2017-302. The industry this zoning change will allow for endangers the health, safety and, welfare of the community, and violates the premise of the smart code zoning that we have spent so much time, effort and federal money employing.

This zoning change will provide for industry that will negatively affect the agriculture industry in Jefferson County and beyond. The combination of the air emissions and threat to the ground water resources could have devastating consequences for the agricultural community of Jefferson County.

The comprehensive plan of Ranson is clear: it states, "the City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community." This land is ill-suited for an industrial facility due to its location and hydrogeology. Further, the industry that this zoning change will allow for will adversely affect the health, safety, and welfare of the community through its affect on the agricultural industry.

The agriculture industry in Jefferson County is hundreds of years old and continues to serve our community well today. According to the economic impact study "A Shared Agenda for Growing West Virginia's Agricultural Economy, Prepared by Fourth Economy for West Virginia Department Of Agriculture West Virginia University Extension Service 2012," Jefferson County is the second highest producing county for crops sales, third highest for fruits and vegetables sales, and in the top 9 counties for sales of animals and animal products.

Agriculture, tourism and the equine industries work synergistically to have an outsized positive impact on the economy in Ranson and Jefferson County as a whole. Agriculture drives tourism by creating agro-tourism opportunities, preserving beautiful open spaces that contribute to the

bucolic nature of our county, and providing the locally produced agriculture goods many tourists are look for in our markets and restaurants. Agriculture also supports the equine industry by providing local products like hay and straw, helping maintain pasture land, co-supporting local dual-purpose retail stores, and helping recycle by products. Agriculture helps maintain the way of life that many those who choose to live in Jefferson County enjoy. Industrial manufacturing and industry this zoning will provide for could never achieve these things.

Local agriculture also provides a source of locally produced agricultural goods. It has become apparent with the current pandemic and health emergency. This became a supply chain crisis because as our supply chains have moved to be ever more lean and efficient they lack resiliency and agility. By having a local source of agricultural goods and food we add resiliency and agility into our own economy and community. The agricultural industry in Jefferson County provides this.

A plethora of scientific studies have shown that a variety of air pollutants produced by the type of industry this zoning change would provide for causes decreased yields of both quantity and quality for several of the crops important to Jefferson County including winter wheat and soybeans. Soybeans and wheat are two of the crops significantly affected and two of the most prevalent crops in Jefferson County. Lower crop yields harm the farms and all the members of the down stream supply chain as well as the consumer. In this way, this zoning change will adversely affect the welfare of the community.

Recent studies have shown that even small increases in air pollution affect the productivity of agricultural workers. Similar to the reduction in crop yield this will negatively affect the individual workers, businesses, consumers and industry as a whole. In this way, this zoning change will adversely affect the health and welfare of individuals and the community.

Even more devastating is the possibility of groundwater contamination. The land at the subject location has karst hydrogeology and as such has porous bedrock and severe ground instability problems. The porous bedrock allows rapid diffuse infiltration of surface water into ground water and the severe ground instability problems leads to sinkhole development. Sinkholes provide direct connection of the surface water with the ground water aquifer through point infiltration. In fact, according to a 2012 study by Doctor and Doctor, the subject location and that of Terrapins Neck have the highest sinkhole vulnerability of any sites in Jefferson County. The propensity and easy of diffuse and point infiltration in areas of karst hydrogeology give them very high aquifer vulnerability meaning the aquifer is very vulnerable to contamination. For this reason, this measure has been used for decades by policymakers to set land use regulations. In this way, this zoning change and the industry it will provide for will adversely affect the welfare of the community.

The WVDEP recognizes development in car karst areas puts water resources high-risk for contamination but also recognizes that this is best protected against true local land use and zoning ordinances. WVDEP's guiding document Stormwater Management Design in Karst Areas

states, "it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." This document also references the Chesapeake Bay Stormwater Network karst stormwater guidance document the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed. In which it states "...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." Land use policy in Ranson and zoning need to take aquifer vulnerability into consideration as these agencies and documents suggest.

The Jefferson Orchards Voluntary Remediation Plan application reports that the ground water is only 60 feet from the surface at the site. It is described in the scientific literature that this land is an upland plane with large amounts of water in the epikarst, and contamination of this water effects the whole aquifer including the communications with surface water streams. A USGS study demonstrated that the groundwater adjacent to the site communicates readily with several surface water structures and wells miles away from the site. The effects of contamination at this site would go well beyond Ranson fouling large portions of the ground water and surface water in Jefferson County.

Groundwater contamination at the site would have devastating effects on the Agricultural industry in Jefferson county. For geographic and economic reasons it is simply infeasible for the agricultural industry to rely on utility provided water. Based on the scientific literature the site being considered for rezoning is one of the areas of highest aquifer vulnerability in Jefferson County and is inappropriate for the industry that this zoning change will provide for. This land is clearly ill-suited for industrial use and should not be zoned for it.

By threatening the local agricultural industry, the industry that this zoning will provide for will threaten the health, safety, and welfare of the community, and this land is not well-suited for industrial use. The Comprehensive Plan in Ranson is clear the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

I am particularly concerned about our ground water and the long term affects of the plant.

Sincerely,

Natalie Friend

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on Ordinance #2017-302. Ranson's proposed zoning change presents a significant risk to the equine industry in Jefferson County and well beyond. The type of industry that would be allowed by the proposed zoning change in this location would jeopardize horse health, the ground water supply, and workforce productivity. This will cause immediate shrinkage and threaten the long-term viability of the equine industry in the county. In doing so, the industry this zoning change will allow for will adversely affect the health, safety, and welfare of our community.

The site of the proposed rezoning is less than six miles from Charles Town Races, with several breeding, training, and rehabilitation facilities between the two. The industry allowed by this rezoning would produce particulate, gaseous, and hazardous air emissions that would reach these sites. According to the WVDEP air permit, the Rockwool plant in Ranson is permitted to emit 250.87 tons of particulate matter per year into the air (1).

According to a recent study published in the journal of Veterinary Internal Medicine (2), horses are 15 times more sensitive to inhaled particulate matter than humans. Inhaled particulate matter can cause inflammation in horses' lungs that negatively affects performance. Inhaled particulate matter also contributes to the development of inflammatory airway disease (IAD) (3). IAD is a chronic airway disease that can affect horses long after their racing career is over. While there is little research on how other air pollutants affect horses, the effects of pollution on humans can be used to infer potential impact on horses. However unlike human models, these horses are elite athletes continuously exposed, and will thus likely experience detrimental effects at much lower levels of air pollution than humans.

The primary concern with air pollution is that increased levels of pollutants will increase inflammation in horses' lungs. Even small, subclinical amounts of inflammation in the lungs of horses negatively affect performance (2,3,4,5,6,11). This inflammation can also cause increased

recovery times following racing (7,11). Reduced performance and training interruptions can lead to higher risk of injury, reduced winning average, fewer yearly starts, lower yearly earnings, shortened career length, fewer lifetime starts, reduced lifetime earnings, and reduced quality of life (2,3,8,9,11). Each of these situations will lead to decreased return on investment, decreased cash flow, and decreased overall earnings for owners, trainers, and breeders with horses at Charles Town Races and in nearby areas. In this way, the industry this zoning will allow will adversely affect the welfare of our community.

While racing is usually a thoroughbred's first career, it is rarely their last. Some racing horses go on to be breeding stock, while others will have successful careers as sport horses. Jefferson County is an important source of new stock for sport horse trainers from Northern Virginia, and Maryland, and this is a resource for local horseman of both income and placement for horses not appropriate for breeding. However, if retired racehorses are unsound from injury or respiratory disease, they can be difficult to manage as breeding stock or unfit for a career as a sport horse. This affects the horse's quality of life and also places a burden on the industry locally and regionally. In this way, the industry this zoning will provide for will adversely affect the welfare of our community.

The perception of decreased air quality from the increase in regional haze and visible smokestacks as one drives into the county will deter out of state Owners and Breeders from investing in West Virginia bred Race horses, decreasing or eliminating a critical \$50 million a year source of local business volume. In this way, the industry this zoning will provide for will adversely affect the welfare of our community.

Another concern related to the proposed rezoning in Ranson is the risk of groundwater contamination as a result of the karst hydrogeology at the site and the industrial activity. Horsemen will either have to take on the expense of periodically testing water sources or they may not know local ground water is contaminated until their animals are sick. Veterinary care and testing adds expense and uncertainty to an industry that already deals with large inherent risks. The actual occurrence of ground water contamination would be devastating for Jefferson County's equine industry. For both geographic and financial reasons, it is simply impossible to think that the industry could solely use public or private utility-provided water if industrial activity fouled the local groundwater. In this way, the industry this zoning will provide for will adversely affect the health, safety, and welfare of our community.

Finally, studies on US agricultural workers have demonstrated that increased air pollution decreases productivity of outdoors workers. This would place an additional burden on workers, small business owners and the industry. In this way the industry this zoning will provide for will adversely affect the health, safety, and welfare of our community.

The equine industry in Jefferson County is hundreds of years old. It is not worth risking this historic and economically valuable industry by rezoning for industrial companies like Rockwool. An economic impact study of the Charles Town Thoroughbred Horse Racing Industry on Jefferson County's economy found that the spending by owners, breeders, and trainers of the

equine industry directly contributes \$79.4 million to the county each year. Out-of-state owners, breeders, and trainers spend more than \$50 million in Jefferson County every year. The value of total business volume in Jefferson County is \$191 million each year (10). These numbers do not include the effect of the handle or the casino.

The equine industry provides jobs for a broad cross-section of the public. This industry offers individuals of any educational background a variety of paths to achieve a good middle-income living. Many jobs allow individuals to pursue apprenticeships or on-the-job training rather than requiring a costly college education. This flexibility allows for greater lifetime earnings and improved educational debt-to-earnings ratio for these workers. The equine industry also provides opportunities for non-traditional workers by offering job opportunities to those who may not be employable by larger corporations. This industry provides a variety of fulltime, part-time, flexible, and pick-up work. Encouraging this type of flexible job ecosystem helps create a healthy economy with broad participation in employment and consumption.

The equine industry is a large conglomerate of small businesses, which have a multitude of economic benefits over having a few large businesses. It has been extensively reported that small locally owned businesses and start ups create more jobs, cultivate innovation, generate higher incomes, and provide more opportunities for individuals that would otherwise not exist than big non-local firms, which can actually depress local economies. The equine industry provides opportunities for small businesses and startups responsible for this growth of better jobs that are so good for the economy.

The equine industry offers so many other benefits that the industry in the rezoned area would not. For example, the equine industry supports local agriculture by providing a market for agricultural goods such as straw. The robust straw market supported by owners, trainers, and breeders allows for a third cash crop to be produced from one field in a year. Through pastureland and support of local agricultural goods, the equine industry protects and preserves the open spaces that give our county its bucolic quality and help attract tourists. Through the breeders' incentive programs, the equine industry offers unique opportunities to draft state funds back to Jefferson County, to name a few.

Rezoning this area of Ranson for Special District Industrial will allow in entities whose activities are harmful to the equine industry. The losses incurred by the equine industry would far outweigh any benefits derived from industries occupying the rezoned area. Sacrificing the long-term viability of one of our oldest and most productive industries for a net loss in business volume and economic value just does not make good sense for the local economy. This zoning change would provide for industry that would adversely affect the health, safety and welfare of our communities. Please vote NO on Ordinance #2017-302.

Sincerely,

Wade Sanderson

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask you to vote NO on Ordinance #2017-302. The industry this zoning change will allow for endangers the health, safety and, welfare of the community, and violates the premise of the smart code zoning that we have spent so much time, effort and federal money employing.

Any change in zoning needs to align with the comprehensive plan. In Ranson's current comprehensive plan (2012), the city only refers to "heavy industry" in the history section. Here it is characterized as part of a bygone era that has been replaced by an emphasis on agriculture for local food production, open spaces, and quality-of-life. In the remainder of the document, the word industry is used loosely to describe businesses including flower shops and shoe stores. Nothing that resembles the industry that this zoning change will provide for is described in the current comprehensive plan of Ranson.

In the land use section of the comprehensive plan, number ten states:

"Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The comprehensive plan clearly states that the city will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community. This change in zoning clearly negatively affects the health, safety, and welfare of the community.

As the zoning is proposed, the industry that this zoning change will allow for will be directly across the street from houses, parks and other small businesses. A densely populated subdivision and an elementary school already exit directly across the street. While these latter

community sections are not in the city limits, the effect of this zoning on them should still be considered just the same as it would be if they were in the city limits.

The industry that this zoning change will provide for will produce particulate, gaseous, and hazardous air emissions. These emissions have been shown to be detrimental to human health at every stage of life from embryo to old age. In utero and childhood exposure are the most damaging with lasting effects being realized through out life, and with maternal exposure the effects can be felt for generations. Multiple organ systems are affected including respiratory, cardiovascular, neurologic, immune, and endocrine causing defects in multiple processes including in utero development, neurodevelopment, immune and tolerance development, and cognitive defects. There are also psychological, social, and economic effects from both perceived and actual air pollution in both children and adults. Many of these effects can be seen even with short-term exposure or exposure that is lower than the levels recommended by the US Environmental Protection Agency and World Health Organization. These consequences are devastating to the individual and depressing to the local community and economy. State law does not allow a school to be built next to industry that this zoning will allow but yet we are contemplating changing the zoning so this industry can build next to a school. This does not make sense. As Ranson residents, we want Ranson to follow the lead of the state and keep polluting industry away from kids. In these ways, this change in zoning will negatively affect the health and welfare of the community.

In addition to the health effects of the air emissions is the threat to groundwater from the industry that this zoning change would allow. The land in question has karst hydrogeology and therefore very high aquifer vulnerability and is not appropriate for this industry. With the type of industry this zoning will provide for, combined with high aquifer vulnerability, the likelihood of groundwater contamination is too high for the community and region to bear. A USGS study demonstrated that contamination in the groundwater adjacent to the site moves relatively quickly and can be found in wells and surface water structures in a variety of locations in the County. In this way, contamination at the site would affect the drinking water of the great majority of Jefferson County residents. Through the surface water connections, the water at the site also affects the water resources of the region.

Aquifer vulnerability has been used by policy makers for decades to set land use regulations. The guiding document, from the WVDEP, Stormwater Management Design in Karst Areas states, "it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." In Ranson, we need to follow this advice and not change the zoning of this land for use by industry that has among the highest aquifer vulnerability in the County. This zoning change will endanger the safety of the community and region by endangering the safe water resources. As Ranson residents, we want to safeguard the water resources of the county and region by following the WVDEP guidance here.

Further, by reallocating this transect district and replacing it with a monolithic block of Special District Industrial designation, hundreds of housing units, parks and space for small businesses are lost. Ranson loses the potential for property tax on these properties and their improvements, Business and Occupational tax on the businesses and sales tax in retail stores. The community loses out on the opportunity to develop affordable housing and create locations where people can live, work, play, and shop all in the same place reducing the need for travel.

Worse yet apparently a deal has been made where the entity that owns the subject land has required that a litany of things not be built on the adjacent land essentially stripping the purpose of the smart code transect zone that exists there. Transect zones in the smart code are meant to transition, from out to in, and provide communities where people can safely work and live in close proximity in an effort to reduce travel. Excluding many of the components of the transect zone effectively eliminates the features that make it a transect zone, thus, losing the benefits a transect zone offers the community and city. By losing these benefits, reducing the overall and affordable housing prospects, and reducing so drastically the opportunities for city income, this zoning change will negatively affect the welfare of the community.

As Ranson residents, we find it odd that we are changing zoning to provide for industry that we would not put in the middle of our town close to our residents, but we are placing it close to the homes of county residents. Further, it is striking that the area where this change in zoning is directly adjacent to historically underserved lower income communities and a Title I school. This amounts to environmental injustice and cannot be tolerated.

The purpose of zoning is for a city to protect the health, welfare, morals and safety of the community. In this case, the air emissions and heavy truck traffic will endanger the communities' health. The threat of water contamination will endanger the safety of the community. The effect of lost productivity and decreased workforce participation due to increased illness and the negative effect the air emissions and presence of such a factory will have on the local economy will negatively affect the welfare of the community. The environmental injustice of changing the zoning to accommodate such polluting industry in a location where your municipality has no residents, but yet hundreds of low income and underserved county residents live is egregiously amoral. This must not happen. We respectfully implore you to do the right thing and vote no on ordinance #2017-302.

I am frankly appalled by the past actions of the Ranson Council, regarding Rockwool. I hope that the outcry from Jefferson County Citizens, and leaders from neighboring states, along with a better understanding of the facts, will persuade Council members to right this disastrous wrong.

Sincerely,

Linda Zwobota

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302

NO TO ROCKWOOL. NO TO POLLUTION

Sincerely,

Judy Powers

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would put at risk the health and well being of children of Jefferson County.

The type of industry that ordinance #2017-302 would allow in Ranson would generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. Exposure to these pollutants has devastating effects on children's health. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. Developing fetuses whose mothers are exposed to air pollution are more likely to have impaired organ development which can lead to early cognitive deficits, neurodevelopmental defects and other physical, cognitive, and psychological deficits later in life. An association between autism and prenatal exposure to particulate matter in air pollution has been demonstrated in several studies. Many studies have shown that lower test scores in math, English, and language arts are associated with exposure to outdoor air pollution. Industrial activity allowed by ordinance #2017-302 would also increase the risk of groundwater contamination in Ranson and nearby municipalities. Children whose families rely on well water, as is the case in much of Jefferson County, may be affected by polluted water. Voting no on ordinance #2017-302 will prevent air and water pollution from negatively affecting the long-term health of children in Jefferson County and surrounding areas.

The economic and environmental harm caused by the type of industry that ordinance #2017-302 would allow would put additional stress on the parents, caretakers, and teachers of children in affected areas. The weakening and destabilizing of this support network would have negative effects on local children. Many households in Jefferson County depend on the local agriculture, tourism, and equine industries for income. If industrial activity in Ranson depresses these industries, the resulting financial strain on these households will introduce additional stress and uncertainty into children's lives. Households living in areas affected by particulate

matter and regional haze will also suffer from the psychological effects of air pollution. Individuals living in areas with increase perception of pollution show increased levels of stress, anxiety, and unhappiness. School districts affected by increased air and water pollution may have trouble recruiting and retaining teachers. Teachers have a large influence on a child's daily life and, if educator quality and tenure decreases, the quality of this influence will diminish.

The site of the proposed rezoning in Ranson is across the road from an elementary school and proximal to lower-income neighborhoods. Observations like these demonstrate how ordinance #2017-302 would disproportionately affect vulnerable and historically-disadvantaged populations. The damaging health effects of air pollution have been shown to persist for at least three generations, so allowing certain types of industry in low-income areas would only compound existing disadvantages. Voting no on ordinance #2017-302 would be a step towards acknowledging that all individuals have the right to clean air and water.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." This zoning change would clearly adversely affect the health, safety, and welfare of the community. Children face increased exposure to air pollution adversely affecting their health, financial instability adversely affecting their welfare, groundwater contamination adversely affecting their safety, and environmental injustice and discrimination if ordinance #2017-302 is passed. Educators will face increased air pollution adversely affecting their health and consequently welfare. These adverse effects are all against Ranson's Comprehensive Plan. Please vote NO on Ordinance #2017-302.

Sincerely,

Kendra Clark

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

The lack of consideration for comprehensive community awareness and involvement for this project, and the secretive nature of its roll-out speaks to what most involved already knew: it likely wasn't going to be well received by the general public, and rightfully so. This area doesn't need heavy industry to sustain itself and/or prosper, so why even open that door to what would undoubtedly be a Pandora's box – as we see everywhere else in the state.

Moreover, we need look no further than to the actions of certain members of the County Commission in the last couple years, and, without a doubt, the relentlessly toxic nature and ridiculous behavior of Rockwool's most vocal advocates – Jefferson County Prosperity – to know that the locals behind this project, and thus the project, simply doesn't have Jefferson County's best interests in mind. While some supporters may simply be driven by profits, what we've also come to witness is a sinister underbelly within the county of people in relatively meaningful positions saying, promoting, and/or doing some really reprehensible things – and if these are the folks responsible for promoting Rockwool, then what else will they promote the next chance they get?

Simply put, thanks but no thanks. Jefferson County is doing just fine without Rockwool; all it will ever do is add a massive amount of pollution – whether it's acceptable by certain partisan standards or not – where there wasn't any before. And that's the best-case scenario: there are a whole host of other dangers that come with heavy industry – and we don't need any of them here. Especially since we never needed them in the first place!

Re: #2017-302: “AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: ‘JEFFERSON ORCHARDS’ REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)”

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would negatively affect tourism, economic agility, groundwater quality, and individual health in neighboring municipalities like Shepherdstown. In

doing these things the industry that this zoning change provides for will adversely affect the health, safety, and welfare of our community.

Tourism is critically important to Shepherdstown's economy and to the county as a whole. In 2018, tourist spending in the Jefferson County contributed over \$170 million to state and local government revenue and \$213 million in individual earnings. Importantly, most of this money comes from tourists visiting from neighboring states like Virginia, Maryland, and Washington D.C. Out-of-state tourists are largely drawn to Jefferson County because of its reputation for environmental-friendly, sustainable industry. Key elements that support this reputation include the county's pastoral scenery and pristine natural resources. Ordinance #2017-302 will allow industry into Jefferson County that risks harming these elements and dramatically reducing the area's appeal to visitors. The resulting harm to our tourist industry would drive away visitors and decrease state, county, and local revenue. The long-term success of Jefferson County's tourism industry is dependent on local governments making coordinated zoning decisions. Allowing certain types in industry in Ranson will negatively affect tourism in every municipality throughout the county, including Shepherdstown. Voting no on ordinance #2017-302 will protect the foundations of the county's tourism industry and protect the 7,040 jobs in Jefferson County that are directly supported by tourism. In this way the industry this zoning change will allow will adversely affect the welfare of our community.

The type of large, consolidated industry that ordinance #2017-302 would allow in Ranson would generally reduce the flexibility of local economies in Jefferson County. Historically, the driving industries in Jefferson County have been tourism, agriculture, and the equine industries. These three industries are large conglomerates of small businesses. Small business is very important to Sheherdstown. Small businesses have been shown to create more jobs, cultivate more innovation, and provide more opportunities than big, non-local firms. Additionally, small businesses have been shown to more reactive to sudden changes relative to manufacturing businesses. Bringing large, manufacturing-based industry into Jefferson county will depress the local economy and stifle innovation. During this time of economic upheaval and uncertainty, Jefferson County needs to support industries that will allow local economies to adapt and recover as fast as possible.

Voting no on ordinance #2017-302 will help protect water resources throughout Jefferson County. The type of industry that ordinance #2017-302 would allow puts the ground resources of Jefferson county at significant risk due to the karst hydrogeology. The site in Ranson is in the Rocky Marsh Run watershed, which is in the source water protection zone for Shepherdstown and drains to the Potomac River. Therefore, activity at this site will affect both groundwater and surface water streams. In municipalities like Shepherdstown, many residents and nearby farms depend on wells for water. Contamination of groundwater aquifers would create both health and remediation concerns for local residents. Dye tests performed by the USGS near the area of proposed rezoning in Ranson have shown just how far-reaching groundwater contamination at the Ranson site could be. Results from the USGS study revealed measurable dye concentrations in Elk's Run, Rattlesnake Run, and even the Shepherdstown Town Run. This last run cuts through the center of Shepherdstown and is a favorite area for children to play and

learn to fish. In this way, the industry that this zoning change will allow will adversely affect the safety of our community.

Groundwater pollution is not the only concern for communities like Shepherdstown. The type of industry that ordinance #2017-302 would allow in Ranson would also generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. These pollutants are particularly harmful to children. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. The site in Ranson is across the road from an elementary school and also within the Jefferson High Middle district. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of children in Shepherdstown and all of Jefferson County. In this way, the industry that this zoning change will provide for will adversely affect the health of our community.

I again request that you vote no on ordinance #2017-302. This zoning change will allow industry that will adversely affect the health, safety, and welfare of our community. The long-term economic, environmental, and community health of municipalities like Shepherdstown depend on Ranson's participation in a coordinated zoning plan for all of Jefferson County.

Sincerely,

Mike Chalmers

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask you to vote NO on Ordinance #2017-302. The industry this zoning change will allow for endangers the health, safety and, welfare of the community, and violates the premise of the smart code zoning that we have spent so much time, effort and federal money employing.

Any change in zoning needs to align with the comprehensive plan. In Ranson's current comprehensive plan (2012), the city only refers to "heavy industry" in the history section. Here it is characterized as part of a bygone era that has been replaced by an emphasis on agriculture for local food production, open spaces, and quality-of-life. In the remainder of the document, the word industry is used loosely to describe businesses including flower shops and shoe stores. Nothing that resembles the industry that this zoning change will provide for is described in the current comprehensive plan of Ranson.

In the land use section of the comprehensive plan, number ten states:

"Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The comprehensive plan clearly states that the city will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community. This change in zoning clearly negatively affects the health, safety, and welfare of the community.

As the zoning is proposed, the industry that this zoning change will allow for will be directly across the street from houses, parks and other small businesses. A densely populated subdivision and an elementary school already exit directly across the street. While these latter

community sections are not in the city limits, the effect of this zoning on them should still be considered just the same as it would be if they were in the city limits.

The industry that this zoning change will provide for will produce particulate, gaseous, and hazardous air emissions. These emissions have been shown to be detrimental to human health at every stage of life from embryo to old age. In utero and childhood exposure are the most damaging with lasting effects being realized through out life, and with maternal exposure the effects can be felt for generations. Multiple organ systems are affected including respiratory, cardiovascular, neurologic, immune, and endocrine causing defects in multiple processes including in utero development, neurodevelopment, immune and tolerance development, and cognitive defects. There are also psychological, social, and economic effects from both perceived and actual air pollution in both children and adults. Many of these effects can be seen even with short-term exposure or exposure that is lower than the levels recommended by the US Environmental Protection Agency and World Health Organization. These consequences are devastating to the individual and depressing to the local community and economy. State law does not allow a school to be built next to industry that this zoning will allow but yet we are contemplating changing the zoning so this industry can build next to a school. This does not make sense. As Ranson residents, we want Ranson to follow the lead of the state and keep polluting industry away from kids. In these ways, this change in zoning will negatively affect the health and welfare of the community.

In addition to the health effects of the air emissions is the threat to groundwater from the industry that this zoning change would allow. The land in question has karst hydrogeology and therefore very high aquifer vulnerability and is not appropriate for this industry. With the type of industry this zoning will provide for, combined with high aquifer vulnerability, the likelihood of groundwater contamination is too high for the community and region to bear. A USGS study demonstrated that contamination in the groundwater adjacent to the site moves relatively quickly and can be found in wells and surface water structures in a variety of locations in the County. In this way, contamination at the site would affect the drinking water of the great majority of Jefferson County residents. Through the surface water connections, the water at the site also affects the water resources of the region.

Aquifer vulnerability has been used by policy makers for decades to set land use regulations. The guiding document, from the WVDEP, Stormwater Management Design in Karst Areas states, "it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." In Ranson, we need to follow this advice and not change the zoning of this land for use by industry that has among the highest aquifer vulnerability in the County. This zoning change will endanger the safety of the community and region by endangering the safe water resources. As Ranson residents, we want to safeguard the water resources of the county and region by following the WVDEP guidance here.

Further, by reallocating this transect district and replacing it with a monolithic block of Special District Industrial designation, hundreds of housing units, parks and space for small businesses are lost. Ranson loses the potential for property tax on these properties and their improvements, Business and Occupational tax on the businesses and sales tax in retail stores. The community loses out on the opportunity to develop affordable housing and create locations where people can live, work, play, and shop all in the same place reducing the need for travel.

Worse yet apparently a deal has been made where the entity that owns the subject land has required that a litany of things not be built on the adjacent land essentially stripping the purpose of the smart code transect zone that exists there. Transect zones in the smart code are meant to transition, from out to in, and provide communities where people can safely work and live in close proximity in an effort to reduce travel. Excluding many of the components of the transect zone effectively eliminates the features that make it a transect zone, thus, losing the benefits a transect zone offers the community and city. By losing these benefits, reducing the overall and affordable housing prospects, and reducing so drastically the opportunities for city income, this zoning change will negatively affect the welfare of the community.

As Ranson residents, we find it odd that we are changing zoning to provide for industry that we would not put in the middle of our town close to our residents, but we are placing it close to the homes of county residents. Further, it is striking that the area where this change in zoning is directly adjacent to historically underserved lower income communities and a Title I school. This amounts to environmental injustice and cannot be tolerated.

The purpose of zoning is for a city to protect the health, welfare, morals and safety of the community. In this case, the air emissions and heavy truck traffic will endanger the communities' health. The threat of water contamination will endanger the safety of the community. The effect of lost productivity and decreased workforce participation due to increased illness and the negative effect the air emissions and presence of such a factory will have on the local economy will negatively affect the welfare of the community. The environmental injustice of changing the zoning to accommodate such polluting industry in a location where your municipality has no residents, but yet hundreds of low income and underserved county residents live is egregiously amoral. This must not happen. We respectfully implore you to do the right thing and vote no on ordinance #2017-302.

Sincerely,

Marcia Coffelt

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would negatively affect tourism, economic agility, groundwater quality, and individual health in neighboring municipalities like Shepherdstown. In doing these things the industry that this zoning change provides for will adversely affect the health, safety, and welfare of our community.

Tourism is critically important to Shepherdstown's economy and to the county as a whole. In 2018, tourist spending in the Jefferson County contributed over \$170 million to state and local government revenue and \$213 million in individual earnings. Importantly, most of this money comes from tourists visiting from neighboring states like Virginia, Maryland, and Washington D.C. Out-of-state tourists are largely drawn to Jefferson County because of its reputation for environmental-friendly, sustainable industry. Key elements that support this reputation include the county's pastoral scenery and pristine natural resources. Ordinance #2017-302 will allow industry into Jefferson County that risks harming these elements and dramatically reducing the area's appeal to visitors. The resulting harm to our tourist industry would drive away visitors and decrease state, county, and local revenue. The long-term success of Jefferson County's tourism industry is dependent on local governments making coordinated zoning decisions. Allowing certain types in industry in Ranson will negatively affect tourism in every municipality throughout the county, including Shepherdstown. Voting no on ordinance #2017-302 will protect the foundations of the county's tourism industry and protect the 7,040 jobs in Jefferson County that are directly supported by tourism. In this way, the industry this zoning change will allow will adversely affect the welfare of our community.

The type of large, consolidated industry that ordinance #2017-302 would allow in Ranson would generally reduce the flexibility of local economies in Jefferson County. Historically, the driving industries in Jefferson County have been tourism, agriculture, and the equine industries. These three industries are large conglomerates of small businesses. Small business is very important

to Shepherdstown. Small businesses have been shown to create more jobs, cultivate more innovation, and provide more opportunities than big, non-local firms. Additionally, small businesses have been shown to be more reactive to sudden changes relative to manufacturing businesses. Bringing large, manufacturing-based industry into Jefferson county will depress the local economy and stifle innovation. During this time of economic upheaval and uncertainty, Jefferson County needs to support industries that will allow local economies to adapt and recover as fast as possible.

Voting no on ordinance #2017-302 will help protect water resources throughout Jefferson County. The type of industry that ordinance #2017-302 would allow puts the ground resources of Jefferson county at significant risk due to the karst hydrogeology. The site in Ranson is in the Rocky Marsh Run watershed, which is in the source water protection zone for Shepherdstown and drains to the Potomac River. Therefore, activity at this site will affect both groundwater and surface water streams. In municipalities like Shepherdstown, many residents and nearby farms depend on wells for water. Contamination of groundwater aquifers would create both health and remediation concerns for local residents. Dye tests performed by the USGS near the area of proposed rezoning in Ranson have shown just how far-reaching groundwater contamination at the Ranson site could be. Results from the USGS study revealed measurable dye concentrations in Elk's Run, Rattlesnake Run, and even the Shepherdstown Town Run. This last run cuts through the center of Shepherdstown and is a favorite area for children to play and learn to fish. In this way, the industry that this zoning change will allow will adversely affect the safety of our community.

Groundwater pollution is not the only concern for communities like Shepherdstown. The type of industry that ordinance #2017-302 would allow in Ranson would also generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. These pollutants are particularly harmful to children. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. The site in Ranson is across the road from an elementary school and also within the Jefferson High Middle district. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of children in Shepherdstown and all of Jefferson County. In this way, the industry that this zoning change will provide for will adversely affect the health of our community.

I again request that you vote no on ordinance #2017-302. This zoning change will allow industry that will adversely affect the health, safety, and welfare of our community. The long-term economic, environmental, and community health of municipalities like Shepherdstown depend on Ranson's participation in a coordinated zoning plan for all of Jefferson County.

Sincerely,

Melinda Landolt

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that will significantly harm the municipalities within Jefferson County and beyond effecting the health, welfare, and safety of our community. Harpers Ferry is a national treasure with the natural and historic resources tours flock to see each year and one of the communities that will be negatively impacted by this zoning change.

According to a 2019 study by the West Virginia Tourism Office, Jefferson County generated an average of \$178 million per year in tourism-derived revenue for state and local governments over the last 10 years, more than any other county in West Virginia by at least double. Tourism benefits the businesses and economy of Ranson and Jefferson County producing \$213.7 million in individual earning, 7040 jobs, and \$842.6 million in direct spending here in 2018. We would need 40 Project Shuttles to replace the individual earnings and 59 Rockwools to replace the jobs provided by the tourism industry in Jefferson County. It is important to note that most of the money generated by tourism in Jefferson County comes from neighboring states. In this way, it is like an export: not simply recycling money, but bringing money into the state increasing its wealth. Much of the economy in Harpers Ferry is based on this tourism industry. A threat to this industry poses a threat to the economy and welfare of our community.

One of the important drivers for tourism in Harpers Ferry is the Appalachian Trail. According to the Appalachian Trail Conservancy (ATC), Harpers Ferry is the psychologic midpoint of the Trail, and hikers often plan extended stays in Jefferson County with an obvious positive impact. The ATC reports that the smokestacks and associated lights will be visible in the viewshed of 15 vistas on the Appalachian Trail (AT). Studies have shown that quality of vistas and human impact on the environment are not only noticed by visitors, but effect their experience. Another study published in the Journal of Applied Recreation Research, found that points of interests and views drew visitors' attention and had a significant impact on their perception of the trail. It was also found that particularly beautiful vistas helped visitors overlook elements

that usually have a negative effect on trail experience like increased trail traffic. A 2009 study in Leisure Sciences revealed that scenic value was a perceptual theme of Appalachian Trail visitors, and that things as simple as dead trees visible in a vista can have a negative impact on visitors' overall perception. Imagine the effect the smokestacks will have from the 15 vistas from which they will be visible. The introduction of industrial activity made possible by the proposed rezoning in Ranson would have a negative effect on the scenic views of beautiful landscapes from the Appalachian Trail in Jefferson County.

The smokestacks are not all visitors will be able to see — the air pollution will create haze. The effect of regional haze on tourists was explored in a review article published in the Atmospheric Environment titled "Impaired visibility: the air pollution people see." A key takeaway on the negative affect of haze on vacationing tourists was summarized as follows:

"Vacations offer an escape from the routine and stress of our daily lives. Vacation destinations are often chosen based on their scenery; vacations are spent gazing at monuments, mountains, clouds, and oceans. Good visibility allows clear observation of distant features and appreciation of the inherent beauty of these scenes...Air pollution, which is often present in both our cities and parks, interferes with these attributes and can ruin the views vacationers travel to enjoy."

People seek bucolic, unspoiled areas to escape the stresses of urban areas. A 2004 study in Environment and Behavior found perceived pollution causes stress while viewing natural scenes has both psychological and physiological benefits, and a 2007 study confirmed these benefits. Two other studies found that people are emotionally affected by poor visibility, and tourists are disappointed when views are obscured by haze.

The combination of smokestacks and haze will mar the viewshed and will not only reduce the positive effects of a scenic landscape but also leave tourists disappointed and dissatisfied with their choice of destination. With these effects the welfare of the Harpers Ferry community would undoubtedly be endangered by the industry that this zoning change will provide for.

Multiple studies by doctors Kozar, Doctor, and Doctor have demonstrated that the land at this site to be rezoned is Karst with the highest likelihood of sinkhole development in the county, and that the groundwater aquifer there is incredibly sensitive to contamination from surface water. Further, this site is on an upland plain with relatively few surface streams, seasonal variability in the water table that results in numerous estavelles, and large amounts of water in the epikarst. In this area contamination in surface water communicates easily to the water in the epikarst via diffuse and point infiltration, and the springs at the margins of the upland area are directly affected by the water quality throughout the aquifer. According to Jefferson Orchards Voluntary Remediation Plan with the WVDEP, the groundwater at the site is approximately 60 feet below the ground, and the tests performed by the USGS have shown that groundwater from just adjacent to this site emerged in the headwaters of both the Elk's Run and Rattlesnake Run. This is critically important for Harpers Ferry because the Elk's Run headwaters is a spring about three miles southeast of the site and goes on to become the drinking water source for Harpers Ferry and Bolivar before emptying into the Potomac River.

The headwaters of Rattlesnake Run is a spring about 3.5 miles from the site and is also a tributary of the Potomac River. The Potomac River is the back up water source for Harpers Ferry. This means that the activity at the site will have a critical influence on the drinking water of Harpers Ferry. In this was the industry permitted by this change in zoning would undoubtedly endanger the health and safety of the community in Harpers Ferry.

The untoward health effects and individual economic consequences from the pollution emissions of the industry this rezoning will allow that will be born out over the length of people's lives and that of their decedents for at least three generations is an egregious example of environmental injustice that should not be tolerated. This zoning change may be in one of the poorest sections of the county, but the effects will be felt in every part of Ranson and the county.

The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." The industry that this rezoning will allow will jeopardize the health, safety and welfare of Ranson, Harpers Ferry and the whole county. Please vote no on the ordinance #2017-302.

Sincerely,

Ruth Campbell

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would have a negative effect on water and air quality in neighboring states such as Maryland.

The Potomac River provides drinking water and a source of recreation to Maryland residents. Water and air pollution generated within the Potomac River's watershed will inevitably contaminate this valuable waterway. The site of the proposed zoning change in Ranson is located within the Potomac River Watershed.

The type of industry that ordinance #2017-302 would allow in Ranson would utilize large water impoundments, in an area of known karst terrain. This water will be contaminant from several sources including particulate mater that has fallen out from the air emissions and process water. The West Virginia Department of Environmental Protection has published guidelines that specifically discourage extensive development in areas of karst terrain because of the vulnerability of karst aquifers to contamination by surface pollution. Karst features increase surface water and groundwater connectivity and any spills or surface releases quickly percolate into the groundwater. Additionally, sinkholes are common in karst terrain and can cause ruptures in wastewater impoundments. Even if appropriate attempts are made to contain and manage wastewater and other stormwater runoff on-site, there is still a high risk that wastewater could contaminate the groundwater through tears and catastrophic failure of wastewater impoundments. Contaminated groundwater in karst terrain can easily resurface in waterways several miles away, as shown by a USGS tracer study conducted near the site in to be rezoned. The USGS study detected tracer dye in multiple springs and waterways miles from the initial injection site in Ranson. All of these waterways drain into the Potomac River.

Mismanagement of wastewater could also lead to contamination of nearby surface waters. For example, the site of the proposed rezoning in Ranson is in the Rocky Marsh Run watershed.

Rocky Marsh Run also drains to the Potomac River. Voting no on ordinance #2017-302 will preserve downstream water quality and help ensure that the Potomac River remains usable for Maryland residents.

Air pollution poses another risk to Maryland residents. The type of industry that ordinance #2017-302 would allow would generate air pollutants like fine particulate matter. According to the US EPA, fine particulates can travel 100s of miles from its original source. Air pollution related to industrial activity in Ranson could easily reach Maryland. Fine particulates have a greater affinity for carrying toxic compounds and their small size allows them to be inhaled more deeply into the lungs. Chronic exposure to fine particulate matter is associated with increased risk of several diseases including Alzheimer's in adults. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease among others. Fine particulate matter also exacerbates regional haze which creates a visible reminder of air pollution. The psychological effects that arise from an increased perception of pollution include stress, anxiety, and unhappiness. Voting no on ordinance #2017-302 will help prevent increased air pollution from negatively affecting the long-term health of Maryland residents.

The industry that this zoning will provide for will threaten the health, safety, and welfare of the residents in Maryland, and this land is not well-suited for industrial use. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." To achieve this, the council must not approve this proposed zoning change.

I again request that you vote no on ordinance #2017-302. Zoning decisions in Ranson and Jefferson County have an undeniable influence on the quality of life in neighboring states.

Sincerely,

Patricia Beach

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would negatively affect tourism, economic agility, groundwater quality, and individual health in neighboring municipalities like Shepherdstown. In doing these things the industry that this zoning change provides for will adversely affect the health, safety, and welfare of our community.

This industry is endangering ALL the well water in the county.

Tourism is critically important to Shepherdstown's economy and to the county as a whole. In 2018, tourist spending in the Jefferson County contributed over \$170 million to state and local government revenue and \$213 million in individual earnings. Importantly, most of this money comes from tourists visiting from neighboring states like Virginia, Maryland, and Washington D.C. Out-of-state tourists are largely drawn to Jefferson County because of its reputation for environmental-friendly, sustainable industry. Key elements that support this reputation include the county's pastoral scenery and pristine natural resources. Ordinance #2017-302 will allow industry into Jefferson County that risks harming these elements and dramatically reducing the area's appeal to visitors. The resulting harm to our tourist industry would drive away visitors and decrease state, county, and local revenue. The long-term success of Jefferson County's tourism industry is dependent on local governments making coordinated zoning decisions. Allowing certain types in industry in Ranson will negatively affect tourism in every municipality throughout the county, including Shepherdstown. Voting no on ordinance #2017-302 will protect the foundations of the county's tourism industry and protect the 7,040 jobs in Jefferson County that are directly supported by tourism. In this way the industry this zoning change will allow will adversely affect the welfare of our community.

The type of large, consolidated industry that ordinance #2017-302 would allow in Ranson would generally reduce the flexibility of local economies in Jefferson County. Historically, the driving

industries in Jefferson County have been tourism, agriculture, and the equine industries. These three industries are large conglomerates of small businesses. Small business is very important to Shepherdstown. Small businesses have been shown to create more jobs, cultivate more innovation, and provide more opportunities than big, non-local firms. Additionally, small businesses have been shown to be more reactive to sudden changes relative to manufacturing businesses. Bringing large, manufacturing-based industry into Jefferson county will depress the local economy and stifle innovation. During this time of economic upheaval and uncertainty, Jefferson County needs to support industries that will allow local economies to adapt and recover as fast as possible.

Voting no on ordinance #2017-302 will help protect water resources throughout Jefferson County. The type of industry that ordinance #2017-302 would allow puts the ground resources of Jefferson county at significant risk due to the karst hydrogeology. The site in Ranson is in the Rocky Marsh Run watershed, which is in the source water protection zone for Shepherdstown and drains to the Potomac River. Therefore, activity at this site will affect both groundwater and surface water streams. In municipalities like Shepherdstown, many residents and nearby farms depend on wells for water. Contamination of groundwater aquifers would create both health and remediation concerns for local residents. Dye tests performed by the USGS near the area of proposed rezoning in Ranson have shown just how far-reaching groundwater contamination at the Ranson site could be. Results from the USGS study revealed measurable dye concentrations in Elk's Run, Rattlesnake Run, and even the Shepherdstown Town Run. This last run cuts through the center of Shepherdstown and is a favorite area for children to play and learn to fish. In this way, the industry that this zoning change will allow will adversely affect the safety of our community.

Groundwater pollution is not the only concern for communities like Shepherdstown. The type of industry that ordinance #2017-302 would allow in Ranson would also generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. These pollutants are particularly harmful to children. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. The site in Ranson is across the road from an elementary school and also within the Jefferson High Middle district. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of children in Shepherdstown and all of Jefferson County. In this way, the industry that this zoning change will provide for will adversely affect the health of our community.

I again request that you vote no on ordinance #2017-302. This zoning change will allow industry that will adversely affect the health, safety, and welfare of our community. The long-term economic, environmental, and community health of municipalities like Shepherdstown depend on Ranson's participation in a coordinated zoning plan for all of Jefferson County.

Sincerely,

Bradley Sanders
Shepherdstown, 25443

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask that you vote no on Ordinance #2017-302. While not in Ranson, the land and homes around the property that is the subject of the zoning change are closer to the property than anyone who currently lives within the city limits of Ranson. This area will be affected sooner and more harshly by the environmental issues that will develop secondary to the inappropriate siting of industry this zoning would allow.

The subject land has been well studied by Drs. Kozar, Doctor and Doctor and described in the scientific literature and USGS reports as having karst hydrology with very high aquifer vulnerability. The karst landscape is a consequence of the presence of soluble bedrock, which consists of limestone in the case of the subject land. In such landscapes water percolates through the ground and dissolves the underlying rock creating a porous network of caverns and throughways. Karst aquifers are known to be "extremely vulnerable to pollution" due to direct connection between the surface water and groundwater through both point (sinkholes) and diffuse (everywhere) infiltration. It is known from the Voluntary Remediation Plan of Jefferson Orchard that the groundwater at the subject site is only 60 feet below the ground. The subject property and much of the property around it are on an upland plain with few surface streams, but great seasonal variability in the water table resulting in numerous esteves and large amounts of water in the epikarst. This water is easily contaminated and this contamination spreads quickly throughout the aquifer. Dye tests performed near the subject site by the USGS have demonstrated this quick moving thorough dispersment in the aquifer in this area. While this contamination goes on to affect springs at the margins of the upland area continuing on in streams that service municipal water sources and the Potomac River, our concerns are far more immediate in both time and distance. Well water is the only water source available in the area of the proposed zoning change and, with the exception of Fox Glen, a majority of this water is supplied by private wells. Therefore, the groundwater aquifer fulfills a critical necessity, fulfilling all needs including human consumption, household uses, and agriculture and

maintenance of livestock and horses in the immediate area around the site. The concern is that if the aquifer becomes contaminated, then the local drinking water will be fouled.

For decades now, policy makers have been using “Aquifer Vulnerability,” to set land use and water resource protection policy. Karst has very high Aquifer Vulnerability. Therefore, this industrial use is not appropriate for this land and it should not be zoned for it. The guiding documents of the WVDEP recognize this. The introduction to the WVDEP document Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.”

The Chesapeake Bay Stormwater Network karst stormwater guidance document the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed, which the WVDEP cites in its own guiding document Stormwater Management Design in Karst Areas, clearly agrees stating:

“First, the effect of land development on karst terrain is complex and hard to predict, and requires professional analysis to reduce the risk of geological hazards, damage to infrastructure and groundwater contamination.” “The working group acknowledges that past approaches to stormwater and land development in karst terrain have been inadequate to safeguard the public and the environment.” “...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” We clearly need stronger comprehensive land use plans and zoning that direct new growth away from karst areas to more appropriate locations. Ordinance #2017-302 is literally the opposite of this.

Further, we cannot rely on the WVDEP to do the job that good local land use guidelines and zoning should do. For example, the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed states that detention and retention ponds are not recommended on karst and categorize them as discouraged. Also, quoting WVDEP’s own karst guidance: “attenuating surface runoff will increase the rate of sinkhole formation and potential groundwater contamination.” Yet the entity currently planning to utilize this zoning change is planning employment of multiple massive retention ponds and attenuating surface runoff completely. This has already been approved by the DEP in two Construction Stormwater General Permit registrations for that company. One of detention ponds is not even regulated by the DEP as it contains process water and has no outlet. Clearly the DEP recognizes the risks but is not appropriately limiting them. Relying on the DEP to protect the public health, safety, welfare, and the environment from any entity in these karst locations is simply as the CNS bulletin said it “inadequate to safeguard the public and the environment.” We must have appropriate zoning that takes into consideration appropriate use of land with karst hydrogeology. Ordinance #2017-302 does not do this, but instead increases the risk to the public and the environment.

A second serious concern is the air emissions from the industry that this zoning will provide for. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. These types of air emissions have been shown to increase the risk of, contribute to, and exacerbate a multitude of developmental, physical, physiological, physiological, cognitive and economic. The exposure of one individual can cause repercussions in multiple generations. Embryos, fetuses, and children are most vulnerable with effects born out over a lifetime, and that of their offspring. Many of these effects only require short-term exposure and some have even been shown to occur at levels below current limits recommended by the World Health Organization. One example of this is that a recent study found that “Even within the limits set by the World Health Organization, the pollutants PM₁₀, SO₂, NO₂, and O₃ are associated with increased risk of treatment for respiratory diseases in children 0 to 6 years of age.” Unfortunately, the US limits are higher than WHO, 300 % higher in the case of PM₁₀!

In fact, in 2019, in the Advice from the Independent Particulate Matter Review Panel (formerly U.S. EPA Clean Air Scientific Advisory Committee Particulate Matter Review Panel) on EPA’s Policy Assessment for the Review of the National Ambient Air Quality Standards for Particulate Matter, it stated that the committee unanimously and unequivocally found that the current primary annual and 24-hour PM_{2.5} National Ambient Air Quality Standards (NAAQS) are not adequate to protect public health. The advice from this 20-member committee, whose scientific disciplines include epidemiology, medicine, toxicology, air quality measurement, air quality modeling, exposure assessment measurement and modeling, risk assessment, statistics, and others, was ignored due presumably to political pressure. Not only are the NAAQS too high in some cases, but due to the measure and mechanism by which they work, they can not replace the safety provided by good land use and zoning regulations, that are meant to do things like keep factories with air emissions and hundreds of heavy trucks away from elementary schools. In fact, there is a state law that prohibits siting a school near a factory. Unfortunately, the reciprocal law does not exist. Clearly, just like with the water resources, we cannot rely on the DEP or the EPA to do the job of what appropriate zoning should do. The whole point of zoning is to keep people safe and provide for their health and welfare. Ordinance #2017-302 puts families and school children directly in harms way.

The air emissions, threat to the groundwater, and the very presence of the industry that this zoning change will allow for will have a serious negative economic effect on those who live and or work closest to the site in question. Productivity and workforce participation will be negatively affected by the health effects of the air emissions. The local agricultural operations will be negatively affected by the air emissions with lower quantity and quality of crop yield and would be devastated if the ground water aquifer were fouled. The equine operations in the area, of which there are several, will be negatively affected by the air emissions as they affect the horses’ health and performance. The mere presence of the industry that will be provided for by this zoning change will cause property values to fall. There will be serious economic consequences for the immediate area around the site in question.

Several of the communities in the immediate area of the site for proposed zoning change are traditionally underserved and have lower economic status. The choice of this location for such a zoning change represents an egregious example of environmental injustice that should not be promulgated or tolerated.

This zoning change will provide for industry that will negatively affect the health safety and welfare of our community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Brian Burdi

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask you to vote NO on Ordinance #2017-302. The industry this zoning change will allow for endangers the health, safety and, welfare of the community, and violates the premise of the smart code zoning that we have spent so much time, effort and federal money employing.

Any change in zoning needs to align with the comprehensive plan. In Ranson's current comprehensive plan (2012), the city only refers to "heavy industry" in the history section. Here it is characterized as part of a bygone era that has been replaced by an emphasis on agriculture for local food production, open spaces, and quality-of-life. In the remainder of the document, the word industry is used loosely to describe businesses including flower shops and shoe stores. Nothing that resembles the industry that this zoning change will provide for is described in the current comprehensive plan of Ranson.

In the land use section of the comprehensive plan, number ten states:

"Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The comprehensive plan clearly states that the city will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community. This change in zoning clearly negatively affects the health, safety, and welfare of the community.

As the zoning is proposed, the industry that this zoning change will allow for will be directly across the street from houses, parks and other small businesses. A densely populated subdivision and an elementary school already exit directly across the street. While these latter

community sections are not in the city limits, the effect of this zoning on them should still be considered just the same as it would be if they were in the city limits.

The industry that this zoning change will provide for will produce particulate, gaseous, and hazardous air emissions. These emissions have been shown to be detrimental to human health at every stage of life from embryo to old age. In utero and childhood exposure are the most damaging with lasting effects being realized through out life, and with maternal exposure the effects can be felt for generations. Multiple organ systems are affected including respiratory, cardiovascular, neurologic, immune, and endocrine causing defects in multiple processes including in utero development, neurodevelopment, immune and tolerance development, and cognitive defects. There are also psychological, social, and economic effects from both perceived and actual air pollution in both children and adults. Many of these effects can be seen even with short-term exposure or exposure that is lower than the levels recommended by the US Environmental Protection Agency and World Health Organization. These consequences are devastating to the individual and depressing to the local community and economy. State law does not allow a school to be built next to industry that this zoning will allow but yet we are contemplating changing the zoning so this industry can build next to a school. This does not make sense. As Ranson residents, we want Ranson to follow the lead of the state and keep polluting industry away from kids. In these ways, this change in zoning will negatively affect the health and welfare of the community.

In addition to the health effects of the air emissions is the threat to groundwater from the industry that this zoning change would allow. The land in question has karst hydrogeology and therefore very high aquifer vulnerability and is not appropriate for this industry. With the type of industry this zoning will provide for, combined with high aquifer vulnerability, the likelihood of groundwater contamination is too high for the community and region to bear. A USGS study demonstrated that contamination in the groundwater adjacent to the site moves relatively quickly and can be found in wells and surface water structures in a variety of locations in the County. In this way, contamination at the site would affect the drinking water of the great majority of Jefferson County residents. Through the surface water connections, the water at the site also affects the water resources of the region.

Aquifer vulnerability has been used by policy makers for decades to set land use regulations. The guiding document, from the WVDEP, Stormwater Management Design in Karst Areas states, "it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." In Ranson, we need to follow this advice and not change the zoning of this land for use by industry that has among the highest aquifer vulnerability in the County. This zoning change will endanger the safety of the community and region by endangering the safe water resources. As Ranson residents, we want to safeguard the water resources of the county and region by following the WVDEP guidance here.

Further, by reallocating this transect district and replacing it with a monolithic block of Special District Industrial designation, hundreds of housing units, parks and space for small businesses are lost. Ranson loses the potential for property tax on these properties and their improvements, Business and Occupational tax on the businesses and sales tax in retail stores. The community loses out on the opportunity to develop affordable housing and create locations where people can live, work, play, and shop all in the same place reducing the need for travel.

Worse yet apparently a deal has been made where the entity that owns the subject land has required that a litany of things not be built on the adjacent land essentially stripping the purpose of the smart code transect zone that exists there. Transect zones in the smart code are meant to transition, from out to in, and provide communities where people can safely work and live in close proximity in an effort to reduce travel. Excluding many of the components of the transect zone effectively eliminates the features that make it a transect zone, thus, losing the benefits a transect zone offers the community and city. By losing these benefits, reducing the overall and affordable housing prospects, and reducing so drastically the opportunities for city income, this zoning change will negatively affect the welfare of the community.

As Ranson residents, we find it odd that we are changing zoning to provide for industry that we would not put in the middle of our town close to our residents, but we are placing it close to the homes of county residents. Further, it is striking that the area where this change in zoning is directly adjacent to historically underserved lower income communities and a Title I school. This amounts to environmental injustice and cannot be tolerated.

The purpose of zoning is for a city to protect the health, welfare, morals and safety of the community. In this case, the air emissions and heavy truck traffic will endanger the communities' health. The threat of water contamination will endanger the safety of the community. The effect of lost productivity and decreased workforce participation due to increased illness and the negative effect the air emissions and presence of such a factory will have on the local economy will negatively affect the welfare of the community. The environmental injustice of changing the zoning to accommodate such polluting industry in a location where your municipality has no residents, but yet hundreds of low income and underserved county residents live is egregiously amoral. This must not happen. We respectfully implore you to do the right thing and vote no on ordinance #2017-302.

Sincerely,

MV

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on #2017-302. The air emissions, possibility of ground and surface water contamination, and their effect on our interwoven economies threaten the health, safety and welfare of not just Jefferson County but the greater region, including Loudoun and the greater Northern Virginia area.

This zoning would provide for industry that produces large amounts of air emissions. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. Northern Virginia is directly downwind from these emissions. Much of the gaseous, fine particulate, and hazardous emissions can reach Northern Virginia. Further affecting the outdoor air quality of the adjacent portion of Virginia and the ability of these areas to achieve and maintain National Ambient Air Quality Standards (NAAQS) attainment. This will affect agriculture and outdoor leisure and recreation.

For example, Loudoun County has been in nonattainment for the NAAQS 8-hour Ozone standard for the past two years. VOC and NO_x react after they have been emitted to produce ground level ozone. The industry that this rezoning would provide for would produce large amounts of these emissions. This would make it even harder as Loudoun County tries to achieve attainment. As time goes on and the scientific research advances our knowledge and understanding of the extent to which gaseous, particulate and hazardous emissions affect human health the NAAQS standards are likely to be reduced. The effects on air emission from this rezoning will make it only harder for Loudoun and Northern Virginia to meet these standards.

In addition to the concerns about the air, the possible ground and surface water contamination is very concerning to Loudoun and Virginia residents. The site is known to have ground water that is vulnerable to contamination due to the karst hydrogeology. A USGS study demonstrated that the ground water adjacent to the site to be rezoned communicates readily with surface

water tributaries of the Potomac River. In addition to direct infiltration where water moves directly from the surface to groundwater via porous limestone bedrock, karst is known to have severe ground instability problems. This makes karst geology prone to sinkhole development. Sinkholes provide direct connection between the surface water and any contaminants it may contain and the groundwater. This makes the aquifer vulnerability in karst areas very high, and contamination with industrial activity such as that provided for by this rezoning too likely. In this way, this zoning change will adversely affect the health and welfare of individuals and the community.

Loudoun sources its drinking water from the Potomac River, downstream of many West Virginia tributaries that carry water from the epikarst and groundwater aquifer at the site to be rezoned. Loudoun has recently completed the new Trap Rock Water Treatment facility, which draws water from the Potomac River. Loudoun currently provides 40 million gallons and projects to provide 90 million gallons of drinking water a day to customers by 2040 (Loudounwater.org). Therefore, the viability of the Potomac River is a high priority for Virginia residents.

Loudoun and Northern Virginia is one of the fastest growing communities in the country and provides a lot to Jefferson County in their symbiotic relationship. Virginia residents support and enjoy Jefferson County through tourism, as our residents enjoy the natural and historical resources of your county. Virginia residents and businesses support the equine industry in a multitude of ways from providing wagering fans at the races to the Virginia Breeders Association Virginia Certified incentive programs and a strong market for retired racehorses. According to an economic impact study from WVU, at least 40% of Jefferson County residents travel outside of West Virginia for work, a good percentage of those travel to northern Virginia. This rezoning would allow for industry that would negatively affect the economy of both places and this relationship and the benefits for our residents gleaned from it.

This zoning change will provide for industry that will negatively effect the health safety and welfare of the Loudoun and Northern Virginia community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Adam Benware

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would put at risk the health and well being of children of Jefferson County.

The type of industry that ordinance #2017-302 would allow in Ranson would generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. Exposure to these pollutants has devastating effects on children's health. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. Developing fetuses whose mothers are exposed to air pollution are more likely to have impaired organ development which can lead to early cognitive deficits, neurodevelopmental defects and other physical, cognitive, and psychological deficits later in life. An association between autism and prenatal exposure to particulate matter in air pollution has been demonstrated in several studies. Many studies have shown that lower test scores in math, English, and language arts are associated with exposure to outdoor air pollution. Industrial activity allowed by ordinance #2017-302 would also increase the risk of groundwater contamination in Ranson and nearby municipalities. Children whose families rely on well water, as is the case in much of Jefferson County, may be affected by polluted water. Voting no on ordinance #2017-302 will prevent air and water pollution from negatively affecting the long-term health of children in Jefferson County and surrounding areas.

As a professional who works with children with disabilities in Jefferson County, I can tell you that families and in fact the coffers of Jefferson County and WV don't need to add any more children with disabilities brought on by poorly planned industry location. The traumatic effects on families and communities as well as the healthcare costs over a lifetime are in no way worth a foreign company's profits.

The economic and environmental harm caused by the type of industry that ordinance #2017-302 would allow would put additional stress on the parents, caretakers, and teachers of

children in affected areas. The weakening and destabilizing of this support network would have negative effects on local children. Many households in Jefferson County depend on the local agriculture, tourism, and equine industries for income. If industrial activity in Ranson depresses these industries, the resulting financial strain on these households will introduce additional stress and uncertainty into children's lives. Households living in areas affected by particulate matter and regional haze will also suffer from the psychological effects of air pollution. Individuals living in areas with increase perception of pollution show increased levels of stress, anxiety, and unhappiness. School districts affected by increased air and water pollution may have trouble recruiting and retaining teachers. Teachers have a large influence on a child's daily life and, if educator quality and tenure decreases, the quality of this influence will diminish.

The site of the proposed rezoning in Ranson is across the road from an elementary school, contrary to the recommendations of the World Health Organization, and proximal to lower-income neighborhoods. Observations like these demonstrate how ordinance #2017-302 would disproportionately affect vulnerable and historically-disadvantaged populations. The damaging health effects of air pollution have been shown to persist for at least three generations, so allowing certain types of industry in low-income areas would only compound existing disadvantages. Voting no on ordinance #2017-302 would be a step towards acknowledging that all individuals have the right to clean air and water.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." I for one was horrified to see Governor Jim Justice, so influential in bringing polluting industry to Jefferson County, come to Shepherdstown to speak to constituents and claim how much he loved children. I couldn't help but think the entire time, if he claims to love children so much, why was he so willing to poison those who attend NJES and 30% of the rest of the student body of Jefferson County. This zoning change would clearly adversely affect the health, safety, and welfare of the community. Children face increased exposure to air pollution adversely affecting their health, financial instability adversely affecting their welfare, groundwater contamination adversely affecting their safety, and environmental injustice and discrimination if ordinance #2017-302 is passed. Educators will face increased air pollution adversely affecting their health and consequently welfare. These adverse effects are all against Ranson's Comprehensive Plan. Please vote NO on Ordinance #2017-302.

Sincerely,

Sharon Helman

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Lucile Allen

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would put at risk the health and well being of children of Jefferson County.

The type of industry that ordinance #2017-302 would allow in Ranson would generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. Exposure to these pollutants has devastating effects on children's health. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. Developing fetuses whose mothers are exposed to air pollution are more likely to have impaired organ development which can lead to early cognitive deficits, neurodevelopmental defects and other physical, cognitive, and psychological deficits later in life. An association between autism and prenatal exposure to particulate matter in air pollution has been demonstrated in several studies. Many studies have shown that lower test scores in math, English, and language arts are associated with exposure to outdoor air pollution. Industrial activity allowed by ordinance #2017-302 would also increase the risk of groundwater contamination in Ranson and nearby municipalities. Children whose families rely on well water, as is the case in much of Jefferson County, may be affected by polluted water. Voting no on ordinance #2017-302 will prevent air and water pollution from negatively affecting the long-term health of children in Jefferson County and surrounding areas.

The economic and environmental harm caused by the type of industry that ordinance #2017-302 would allow would put additional stress on the parents, caretakers, and teachers of children in affected areas. The weakening and destabilizing of this support network would have negative effects on local children. Many households in Jefferson County depend on the local agriculture, tourism, and equine industries for income. If industrial activity in Ranson depresses these industries, the resulting financial strain on these households will introduce additional stress and uncertainty into children's lives. Households living in areas affected by particulate

matter and regional haze will also suffer from the psychological effects of air pollution. Individuals living in areas with increase perception of pollution show increased levels of stress, anxiety, and unhappiness. School districts affected by increased air and water pollution may have trouble recruiting and retaining teachers. Teachers have a large influence on a child's daily life and, if educator quality and tenure decreases, the quality of this influence will diminish.

The site of the proposed rezoning in Ranson is across the road from an elementary school and proximal to lower-income neighborhoods. Observations like these demonstrate how ordinance #2017-302 would disproportionately affect vulnerable and historically-disadvantaged populations. The damaging health effects of air pollution have been shown to persist for at least three generations, so allowing certain types of industry in low-income areas would only compound existing disadvantages. Voting no on ordinance #2017-302 would be a step towards acknowledging that all individuals have the right to clean air and water.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." This zoning change would clearly adversely affect the health, safety, and welfare of the community. Children face increased exposure to air pollution adversely affecting their health, financial instability adversely affecting their welfare, groundwater contamination adversely affecting their safety, and environmental injustice and discrimination if ordinance #2017-302 is passed. Educators will face increased air pollution adversely affecting their health and consequently welfare. These adverse effects are all against Ranson's Comprehensive Plan. Please vote NO on Ordinance #2017-302.

Please review information, opinions, and documents from parties who have no vested interest or financial interest in whether this project is right for the County, ie Doctors, Veterinarians, Scientists, who look at the raw data without any pre-conceived notions or bias on either side of the issue and you find overwhelmingly that there are significant health risks with this type of industry and factory. The negative costs and risks greatly outweigh the perceived positive benefits which this type of facility may bring.

Sincerely,

Michael Keenan

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

lisa Radler

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask that you vote no on Ordinance #2017-302. While not in Ranson, the land and homes around the property that is the subject of the zoning change are closer to the property than anyone who currently lives within the city limits of Ranson. This area will be affected sooner and more harshly by the environmental issues that will develop secondary to the inappropriate siting of industry this zoning would allow.

The subject land has been well studied by Drs. Kozar, Doctor and Doctor and described in the scientific literature and USGS reports as having karst hydrology with very high aquifer vulnerability. The karst landscape is a consequence of the presence of soluble bedrock, which consists of limestone in the case of the subject land. In such landscapes water percolates through the ground and dissolves the underlying rock creating a porous network of caverns and throughways. Karst aquifers are known to be "extremely vulnerable to pollution" due to direct connection between the surface water and groundwater through both point (sinkholes) and diffuse (everywhere) infiltration. It is known from the Voluntary Remediation Plan of Jefferson Orchard that the groundwater at the subject site is only 60 feet below the ground. The subject property and much of the property around it are on an upland plain with few surface streams, but great seasonal variability in the water table resulting in numerous estavelles and large amounts of water in the epikarst. This water is easily contaminated and this contamination spreads quickly throughout the aquifer. Dye tests performed near the subject site by the USGS have demonstrated this quick moving thorough dispersement in the aquifer in this area. While this contamination goes on to affect springs at the margins of the upland area continuing on in streams that service municipal water sources and the Potomac River, our concerns are far more immediate in both time and distance. Well water is the only water source available in the area of the proposed zoning change and, with the exception of Fox Glen, a majority of this water is supplied by private wells. Therefore, the groundwater aquifer fulfills a critical necessity, fulfilling all needs including human consumption, household uses, and agriculture and

maintenance of livestock and horses in the immediate area around the site. The concern is that if the aquifer becomes contaminated, then the local drinking water will be fouled.

For decades now, policy makers have been using “Aquifer Vulnerability,” to set land use and water resource protection policy. Karst has very high Aquifer Vulnerability. Therefore, this industrial use is not appropriate for this land and it should not be zoned for it. The guiding documents of the WVDEP recognize this. The introduction to the WVDEP document Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.”

The Chesapeake Bay Stormwater Network karst stormwater guidance document the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed, which the WVDEP cites in its own guiding document Stormwater Management Design in Karst Areas, clearly agrees stating:

“First, the effect of land development on karst terrain is complex and hard to predict, and requires professional analysis to reduce the risk of geological hazards, damage to infrastructure and groundwater contamination.” “The working group acknowledges that past approaches to stormwater and land development in karst terrain have been inadequate to safeguard the public and the environment.” “...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” We clearly need stronger comprehensive land use plans and zoning that direct new growth away from karst areas to more appropriate locations. Ordinance #2017-302 is literally the opposite of this.

Further, we cannot rely on the WVDEP to do the job that good local land use guidelines and zoning should do. For example, the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed states that detention and retention ponds are not recommended on karst and categorize them as discouraged. Also, quoting WVDEP’s own karst guidance: “attenuating surface runoff will increase the rate of sinkhole formation and potential groundwater contamination.” Yet the entity currently planning to utilize this zoning change is planning employment of multiple massive retention ponds and attenuating surface runoff completely. This has already been approved by the DEP in two Construction Stormwater General Permit registrations for that company. One of detention ponds is not even regulated by the DEP as it contains process water and has no outlet. Clearly the DEP recognizes the risks but is not appropriately limiting them. Relying on the DEP to protect the public health, safety, welfare, and the environment from any entity in these karst locations is simply as the CNS bulletin said it “inadequate to safeguard the public and the environment.” We must have appropriate zoning that takes into consideration appropriate use of land with karst hydrogeology. Ordinance #2017-302 does not do this, but instead increases the risk to the public and the environment.

A second serious concern is the air emissions from the industry that this zoning will provide for. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. These types of air emissions have been shown to increase the risk of, contribute to, and exacerbate a multitude of developmental, physical, physiological, physiological, cognitive and economic. The exposure of one individual can cause repercussions in multiple generations. Embryos, fetuses, and children are most vulnerable with effects born out over a lifetime, and that of their offspring. Many of these effects only require short-term exposure and some have even been shown to occur at levels below current limits recommended by the World Health Organization. One example of this is that a recent study found that “Even within the limits set by the World Health Organization, the pollutants PM₁₀, SO₂, NO₂, and O₃ are associated with increased risk of treatment for respiratory diseases in children 0 to 6 years of age.” Unfortunately, the US limits are higher than WHO, 300 % higher in the case of PM₁₀!

In fact, in 2019, in the Advice from the Independent Particulate Matter Review Panel (formerly U.S. EPA Clean Air Scientific Advisory Committee Particulate Matter Review Panel) on EPA’s Policy Assessment for the Review of the National Ambient Air Quality Standards for Particulate Matter, it stated that the committee unanimously and unequivocally found that the current primary annual and 24-hour PM_{2.5} National Ambient Air Quality Standards (NAAQS) are not adequate to protect public health. The advice from this 20-member committee, whose scientific disciplines include epidemiology, medicine, toxicology, air quality measurement, air quality modeling, exposure assessment measurement and modeling, risk assessment, statistics, and others, was ignored due presumably to political pressure. Not only are the NAAQS too high in some cases, but due to the measure and mechanism by which they work, they can not replace the safety provided by good land use and zoning regulations, that are meant to do things like keep factories with air emissions and hundreds of heavy trucks away from elementary schools. In fact, there is a state law that prohibits siting a school near a factory. Unfortunately, the reciprocal law does not exist. Clearly, just like with the water resources, we cannot rely on the DEP or the EPA to do the job of what appropriate zoning should do. The whole point of zoning is to keep people safe and provide for their health and welfare. Ordinance #2017-302 puts families and school children directly in harms way.

The air emissions, threat to the groundwater, and the very presence of the industry that this zoning change will allow for will have a serious negative economic effect on those who live and or work closest to the site in question. Productivity and workforce participation will be negatively affected by the health effects of the air emissions. The local agricultural operations will be negatively affected by the air emissions with lower quantity and quality of crop yield and would be devastated if the ground water aquifer were fouled. The equine operations in the area, of which there are several, will be negatively affected by the air emissions as they affect the horses’ health and performance. The mere presence of the industry that will be provided for by this zoning change will cause property values to fall. There will be serious economic consequences for the immediate area around the site in question.

Several of the communities in the immediate area of the site for proposed zoning change are traditionally underserved and have lower economic status. The choice of this location for such a zoning change represents an egregious example of environmental injustice that should not be promulgated or tolerated.

This zoning change will provide for industry that will negatively affect the health safety and welfare of our community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

lisa Radler

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that will significantly harm the municipalities within Jefferson County and beyond effecting the health, welfare, and safety of our community. Harpers Ferry is a national treasure with the natural and historic resources tours flock to see each year and one of the communities that will be negatively impacted by this zoning change.

According to a 2019 study by the West Virginia Tourism Office, Jefferson County generated an average of \$178 million per year in tourism-derived revenue for state and local governments over the last 10 years, more than any other county in West Virginia by at least double. Tourism benefits the businesses and economy of Ranson and Jefferson County producing \$213.7 million in individual earning, 7040 jobs, and \$842.6 million in direct spending here in 2018. We would need 40 Project Shuttles to replace the individual earnings and 59 Rockwools to replace the jobs provided by the tourism industry in Jefferson County. It is important to note that most of the money generated by tourism in Jefferson County comes from neighboring states. In this way, it is like an export: not simply recycling money, but bringing money into the state increasing its wealth. Much of the economy in Harpers Ferry is based on this tourism industry. A threat to this industry poses a threat to the economy and welfare of our community.

One of the important drivers for tourism in Harpers Ferry is the Appalachian Trail. According to the Appalachian Trail Conservancy (ATC), Harpers Ferry is the psychologic midpoint of the Trail, and hikers often plan extended stays in Jefferson County with an obvious positive impact. The ATC reports that the smokestacks and associated lights will be visible in the viewshed of 15 vistas on the Appalachian Trail (AT). Studies have shown that quality of vistas and human impact on the environment are not only noticed by visitors, but effect their experience. Another study published in the Journal of Applied Recreation Research, found that points of interests and views drew visitors' attention and had a significant impact on their perception of the trail. It was also found that particularly beautiful vistas helped visitors overlook elements

that usually have a negative effect on trail experience like increased trail traffic. A 2009 study in Leisure Sciences revealed that scenic value was a perceptual theme of Appalachian Trail visitors, and that things as simple as dead trees visible in a vista can have a negative impact on visitors' overall perception. Imagine the effect the smokestacks will have from the 15 vistas from which they will be visible. The introduction of industrial activity made possible by the proposed rezoning in Ranson would have a negative effect on the scenic views of beautiful landscapes from the Appalachian Trail in Jefferson County.

The smokestacks are not all visitors will be able to see — the air pollution will create haze. The effect of regional haze on tourists was explored in a review article published in the Atmospheric Environment titled "Impaired visibility: the air pollution people see." A key takeaway on the negative affect of haze on vacationing tourists was summarized as follows:

"Vacations offer an escape from the routine and stress of our daily lives. Vacation destinations are often chosen based on their scenery; vacations are spent gazing at monuments, mountains, clouds, and oceans. Good visibility allows clear observation of distant features and appreciation of the inherent beauty of these scenes...Air pollution, which is often present in both our cities and parks, interferes with these attributes and can ruin the views vacationers travel to enjoy."

People seek bucolic, unspoiled areas to escape the stresses of urban areas. A 2004 study in Environment and Behavior found perceived pollution causes stress while viewing natural scenes has both psychological and physiological benefits, and a 2007 study confirmed these benefits. Two other studies found that people are emotionally affected by poor visibility, and tourists are disappointed when views are obscured by haze.

The combination of smokestacks and haze will mar the viewshed and will not only reduce the positive effects of a scenic landscape but also leave tourists disappointed and dissatisfied with their choice of destination. With these effects the welfare of the Harpers Ferry community would undoubtedly be endangered by the industry that this zoning change will provide for.

Multiple studies by doctors Kozar, Doctor, and Doctor have demonstrated that the land at this site to be rezoned is Karst with the highest likelihood of sinkhole development in the county, and that the groundwater aquifer there is incredibly sensitive to contamination from surface water. Further, this site is on an upland plain with relatively few surface streams, seasonal variability in the water table that results in numerous estavelles, and large amounts of water in the epikarst. In this area contamination in surface water communicates easily to the water in the epikarst via diffuse and point infiltration, and the springs at the margins of the upland area are directly affected by the water quality throughout the aquifer. According to Jefferson Orchards Voluntary Remediation Plan with the WVDEP, the groundwater at the site is approximately 60 feet below the ground, and the tests performed by the USGS have shown that groundwater from just adjacent to this site emerged in the headwaters of both the Elk's Run and Rattlesnake Run. This is critically important for Harpers Ferry because the Elk's Run headwaters is a spring about three miles southeast of the site and goes on to become the drinking water source for Harpers Ferry and Bolivar before emptying into the Potomac River.

The headwaters of Rattlesnake Run is a spring about 3.5 miles from the site and is also a tributary of the Potomac River. The Potomac River is the back up water source for Harpers Ferry. This means that the activity at the site will have a critical influence on the drinking water of Harpers Ferry. In this was the industry permitted by this change in zoning would undoubtedly endanger the health and safety of the community in Harpers Ferry.

The untoward health effects and individual economic consequences from the pollution emissions of the industry this rezoning will allow that will be born out over the length of people's lives and that of their decedents for at least three generations is an egregious example of environmental injustice that should not be tolerated. This zoning change may be in one of the poorest sections of the county, but the effects will be felt in every part of Ranson and the county.

The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." The industry that this rezoning will allow will jeopardize the health, safety and welfare of Ranson, Harpers Ferry and the whole county. Please vote no on the ordinance #2017-302.

Sincerely,

lisa Radler

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask you to vote NO on Ordinance #2017-302. The industry this zoning change will allow for endangers the health, safety and, welfare of the community, and violates the premise of the smart code zoning that we have spent so much time, effort and federal money employing.

This zoning change will provide for industry that will negatively affect the agriculture industry in Jefferson County and beyond. The combination of the air emissions and threat to the ground water resources could have devastating consequences for the agricultural community of Jefferson County.

The comprehensive plan of Ranson is clear: it states, "the City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community." This land is ill-suited for an industrial facility due to its location and hydrogeology. Further, the industry that this zoning change will allow for will adversely affect the health, safety, and welfare of the community through its affect on the agricultural industry.

The agriculture industry in Jefferson County is hundreds of years old and continues to serve our community well today. According to the economic impact study "A Shared Agenda for Growing West Virginia's Agricultural Economy, Prepared by Fourth Economy for West Virginia Department Of Agriculture West Virginia University Extension Service 2012," Jefferson County is the second highest producing county for crops sales, third highest for fruits and vegetables sales, and in the top 9 counties for sales of animals and animal products.

Agriculture, tourism and the equine industries work synergistically to have an outsized positive impact on the economy in Ranson and Jefferson County as a whole. Agriculture drives tourism by creating agro-tourism opportunities, preserving beautiful open spaces that contribute to the

bucolic nature of our county, and providing the locally produced agriculture goods many tourists are look for in our markets and restaurants. Agriculture also supports the equine industry by providing local products like hay and straw, helping maintain pasture land, co-supporting local dual-purpose retail stores, and helping recycle by products. Agriculture helps maintain the way of life that many those who choose to live in Jefferson County enjoy. Industrial manufacturing and industry this zoning will provide for could never achieve these things.

Local agriculture also provides a source of locally produced agricultural goods. It has become apparent with the current pandemic and health emergency. This became a supply chain crisis because as our supply chains have moved to be ever more lean and efficient they lack resiliency and agility. By having a local source of agricultural goods and food we add resiliency and agility into our own economy and community. The agricultural industry in Jefferson County provides this.

A plethora of scientific studies have shown that a variety of air pollutants produced by the type of industry this zoning change would provide for causes decreased yields of both quantity and quality for several of the crops important to Jefferson County including winter wheat and soybeans. Soybeans and wheat are two of the crops significantly affected and two of the most prevalent crops in Jefferson County. Lower crop yields harm the farms and all the members of the down stream supply chain as well as the consumer. In this way, this zoning change will adversely affect the welfare of the community.

Recent studies have shown that even small increases in air pollution affect the productivity of agricultural workers. Similar to the reduction in crop yield this will negatively affect the individual workers, businesses, consumers and industry as a whole. In this way, this zoning change will adversely affect the health and welfare of individuals and the community.

Even more devastating is the possibility of groundwater contamination. The land at the subject location has karst hydrogeology and as such has porous bedrock and severe ground instability problems. The porous bedrock allows rapid diffuse infiltration of surface water into ground water and the severe ground instability problems leads to sinkhole development. Sinkholes provide direct connection of the surface water with the ground water aquifer through point infiltration. In fact, according to a 2012 study by Doctor and Doctor, the subject location and that of Terrapins Neck have the highest sinkhole vulnerability of any sites in Jefferson County. The propensity and easy of diffuse and point infiltration in areas of karst hydrogeology give them very high aquifer vulnerability meaning the aquifer is very vulnerable to contamination. For this reason, this measure has been used for decades by policymakers to set land use regulations. In this way, this zoning change and the industry it will provide for will adversely affect the welfare of the community.

The WVDEP recognizes development in car karst areas puts water resources high-risk for contamination but also recognizes that this is best protected against true local land use and zoning ordinances. WVDEP's guiding document Stormwater Management Design in Karst Areas

states, "it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." This document also references the Chesapeake Bay Stormwater Network karst stormwater guidance document the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed. In which it states "...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." Land use policy in Ranson and zoning need to take aquifer vulnerability into consideration as these agencies and documents suggest.

The Jefferson Orchards Voluntary Remediation Plan application reports that the ground water is only 60 feet from the surface at the site. It is described in the scientific literature that this land is an upland plane with large amounts of water in the epikarst, and contamination of this water effects the whole aquifer including the communications with surface water streams. A USGS study demonstrated that the groundwater adjacent to the site communicates readily with several surface water structures and wells miles away from the site. The effects of contamination at this site would go well beyond Ranson fouling large portions of the ground water and surface water in Jefferson County.

Groundwater contamination at the site would have devastating effects on the Agricultural industry in Jefferson county. For geographic and economic reasons it is simply infeasible for the agricultural industry to rely on utility provided water. Based on the scientific literature the site being considered for rezoning is one of the areas of highest aquifer vulnerability in Jefferson County and is inappropriate for the industry that this zoning change will provide for. This land is clearly ill-suited for industrial use and should not be zoned for it.

By threatening the local agricultural industry, the industry that this zoning will provide for will threaten the health, safety, and welfare of the community, and this land is not well-suited for industrial use. The Comprehensive Plan in Ranson is clear the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

E. JONES

The Comprehensive Plan in Ranson is clear the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,
Susannah Mayo Buckles

I am a farmer and lifelong resident of Jefferson County, growing up on Gap View Farm near Bardane/Shenandoah Junction. This farm was put under the Farmland Protection Program in 2018 after 5 years of applications, analysis, and numerous reviews on the local, state and National levels. It was reviewed, enhanced, and changes made on the farm that would ensure protection of the air, waters, and soils of this farm. An annual physical inspection is made each

year to ensure that I am complying. This I gladly did, knowing that I would be contributing the wellbeing of our community and environment.

By now you surely should be aware of all the unfair, secretive tactics used to try to move this business in (and others like it) without actually letting citizens know what really was happening. I presume you should be even more aware of the toxic levels of pollution this would bring to Jefferson County.

Suffice to say, if this were turned into an industrial zone, there will be no agriculture, or anything else - tourism, travel, parks, organic farmers markets, honey production, county fairs, 4-H - - you name it! THIS WOULD BENEFIT NO ONE WHO ACTUALLY LIVES HERE.

Sincerely,

Susannah Buckles
Charles Town, 25414

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask that you vote no on Ordinance #2017-302. While not in Ranson, the land and homes around the property that is the subject of the zoning change are closer to the property than anyone who currently lives within the city limits of Ranson. This area will be affected sooner and more harshly by the environmental issues that will develop secondary to the inappropriate siting of industry this zoning would allow.

The subject land has been well studied by Drs. Kozar, Doctor and Doctor and described in the scientific literature and USGS reports as having karst hydrology with very high aquifer vulnerability. The karst landscape is a consequence of the presence of soluble bedrock, which consists of limestone in the case of the subject land. In such landscapes water percolates through the ground and dissolves the underlying rock creating a porous network of caverns and throughways. Karst aquifers are known to be "extremely vulnerable to pollution" due to direct connection between the surface water and groundwater through both point (sinkholes) and diffuse (everywhere) infiltration. It is known from the Voluntary Remediation Plan of Jefferson Orchard that the groundwater at the subject site is only 60 feet below the ground. The subject property and much of the property around it are on an upland plain with few surface streams, but great seasonal variability in the water table resulting in numerous esteves and large amounts of water in the epikarst. This water is easily contaminated and this contamination spreads quickly throughout the aquifer. Dye tests performed near the subject site by the USGS have demonstrated this quick moving thorough dispersment in the aquifer in this area. While this contamination goes on to affect springs at the margins of the upland area continuing on in streams that service municipal water sources and the Potomac River, our concerns are far more immediate in both time and distance. Well water is the only water source available in the area of the proposed zoning change and, with the exception of Fox Glen, a majority of this water is supplied by private wells. Therefore, the groundwater aquifer fulfills a critical necessity, fulfilling all needs including human consumption, household uses, and agriculture and

maintenance of livestock and horses in the immediate area around the site. The concern is that if the aquifer becomes contaminated, then the local drinking water will be fouled.

For decades now, policy makers have been using “Aquifer Vulnerability,” to set land use and water resource protection policy. Karst has very high Aquifer Vulnerability. Therefore, this industrial use is not appropriate for this land and it should not be zoned for it. The guiding documents of the WVDEP recognize this. The introduction to the WVDEP document Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.”

The Chesapeake Bay Stormwater Network karst stormwater guidance document the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed, which the WVDEP cites in its own guiding document Stormwater Management Design in Karst Areas, clearly agrees stating:

“First, the effect of land development on karst terrain is complex and hard to predict, and requires professional analysis to reduce the risk of geological hazards, damage to infrastructure and groundwater contamination.” “The working group acknowledges that past approaches to stormwater and land development in karst terrain have been inadequate to safeguard the public and the environment.” “...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” We clearly need stronger comprehensive land use plans and zoning that direct new growth away from karst areas to more appropriate locations. Ordinance #2017-302 is literally the opposite of this.

Further, we cannot rely on the WVDEP to do the job that good local land use guidelines and zoning should do. For example, the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed states that detention and retention ponds are not recommended on karst and categorize them as discouraged. Also, quoting WVDEP’s own karst guidance: “attenuating surface runoff will increase the rate of sinkhole formation and potential groundwater contamination.” Yet the entity currently planning to utilize this zoning change is planning employment of multiple massive retention ponds and attenuating surface runoff completely. This has already been approved by the DEP in two Construction Stormwater General Permit registrations for that company. One of detention ponds is not even regulated by the DEP as it contains process water and has no outlet. Clearly the DEP recognizes the risks but is not appropriately limiting them. Relying on the DEP to protect the public health, safety, welfare, and the environment from any entity in these karst locations is simply as the CNS bulletin said it “inadequate to safeguard the public and the environment.” We must have appropriate zoning that takes into consideration appropriate use of land with karst hydrogeology. Ordinance #2017-302 does not do this, but instead increases the risk to the public and the environment.

A second serious concern is the air emissions from the industry that this zoning will provide for. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. These types of air emissions have been shown to increase the risk of, contribute to, and exacerbate a multitude of developmental, physical, physiological, physiological, cognitive and economic. The exposure of one individual can cause repercussions in multiple generations. Embryos, fetuses, and children are most vulnerable with effects born out over a lifetime, and that of their offspring. Many of these effects only require short-term exposure and some have even been shown to occur at levels below current limits recommended by the World Health Organization. One example of this is that a recent study found that “Even within the limits set by the World Health Organization, the pollutants PM₁₀, SO₂, NO₂, and O₃ are associated with increased risk of treatment for respiratory diseases in children 0 to 6 years of age.” Unfortunately, the US limits are higher than WHO, 300 % higher in the case of PM₁₀!

In fact, in 2019, in the Advice from the Independent Particulate Matter Review Panel (formerly U.S. EPA Clean Air Scientific Advisory Committee Particulate Matter Review Panel) on EPA’s Policy Assessment for the Review of the National Ambient Air Quality Standards for Particulate Matter, it stated that the committee unanimously and unequivocally found that the current primary annual and 24-hour PM_{2.5} National Ambient Air Quality Standards (NAAQS) are not adequate to protect public health. The advice from this 20-member committee, whose scientific disciplines include epidemiology, medicine, toxicology, air quality measurement, air quality modeling, exposure assessment measurement and modeling, risk assessment, statistics, and others, was ignored due presumably to political pressure. Not only are the NAAQS too high in some cases, but due to the measure and mechanism by which they work, they can not replace the safety provided by good land use and zoning regulations, that are meant to do things like keep factories with air emissions and hundreds of heavy trucks away from elementary schools. In fact, there is a state law that prohibits siting a school near a factory. Unfortunately, the reciprocal law does not exist. Clearly, just like with the water resources, we cannot rely on the DEP or the EPA to do the job of what appropriate zoning should do. The whole point of zoning is to keep people safe and provide for their health and welfare. Ordinance #2017-302 puts families and school children directly in harms way.

The air emissions, threat to the groundwater, and the very presence of the industry that this zoning change will allow for will have a serious negative economic effect on those who live and or work closest to the site in question. Productivity and workforce participation will be negatively affected by the health effects of the air emissions. The local agricultural operations will be negatively affected by the air emissions with lower quantity and quality of crop yield and would be devastated if the ground water aquifer were fouled. The equine operations in the area, of which there are several, will be negatively affected by the air emissions as they affect the horses’ health and performance. The mere presence of the industry that will be provided for by this zoning change will cause property values to fall. There will be serious economic consequences for the immediate area around the site in question.

Several of the communities in the immediate area of the site for proposed zoning change are traditionally underserved and have lower economic status. The choice of this location for such a zoning change represents an egregious example of environmental injustice that should not be promulgated or tolerated.

This zoning change will provide for industry that will negatively affect the health safety and welfare of our community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

JoAnne Grove

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

It's just the wrong direction for so many reasons. Let's use our creative spirit to find better options for growth!

Sincerely,

Andrea Hines

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask that you vote no on Ordinance #2017-302. While not in Ranson, the land and homes around the property that is the subject of the zoning change are closer to the property than anyone who currently lives within the city limits of Ranson. This area will be affected sooner and more harshly by the environmental issues that will develop secondary to the inappropriate siting of industry this zoning would allow.

I live two miles from this plant. I have asthma. The levels of particulate matter and other pollutants coming from this factory will almost certainly exacerbate it.

The subject land has been well studied by Drs. Kozar, Doctor and Doctor and described in the scientific literature and USGS reports as having karst hydrology with very high aquifer vulnerability. The karst landscape is a consequence of the presence of soluble bedrock, which consists of limestone in the case of the subject land. In such landscapes water percolates through the ground and dissolves the underlying rock creating a porous network of caverns and throughways. Karst aquifers are known to be "extremely vulnerable to pollution" due to direct connection between the surface water and groundwater through both point (sinkholes) and diffuse (everywhere) infiltration. It is known from the Voluntary Remediation Plan of Jefferson Orchard that the groundwater at the subject site is only 60 feet below the ground. The subject property and much of the property around it are on an upland plain with few surface streams, but great seasonal variability in the water table resulting in numerous esteves and large amounts of water in the epikarst. This water is easily contaminated and this contamination spreads quickly throughout the aquifer. Dye tests performed near the subject site by the USGS have demonstrated this quick moving thorough dispersment in the aquifer in this area. While this contamination goes on to affect springs at the margins of the upland area continuing on in streams that service municipal water sources and the Potomac River, our concerns are far more immediate in both time and distance. Well water is the only water source available in the area of the proposed zoning change and, with the exception of Fox Glen, a majority of this water is

supplied by private wells. Therefore, the groundwater aquifer fulfills a critical necessity, fulfilling all needs including human consumption, household uses, and agriculture and maintenance of livestock and horses in the immediate area around the site. The concern is that if the aquifer becomes contaminated, then the local drinking water will be fouled.

For decades now, policy makers have been using “Aquifer Vulnerability,” to set land use and water resource protection policy. Karst has very high Aquifer Vulnerability. Therefore, this industrial use is not appropriate for this land and it should not be zoned for it. The guiding documents of the WVDEP recognize this. The introduction to the WVDEP document Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.”

The Chesapeake Bay Stormwater Network karst stormwater guidance document the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed, which the WVDEP cites in its own guiding document Stormwater Management Design in Karst Areas, clearly agrees stating:

“First, the effect of land development on karst terrain is complex and hard to predict, and requires professional analysis to reduce the risk of geological hazards, damage to infrastructure and groundwater contamination.” “The working group acknowledges that past approaches to stormwater and land development in karst terrain have been inadequate to safeguard the public and the environment.” “...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” We clearly need stronger comprehensive land use plans and zoning that direct new growth away from karst areas to more appropriate locations. Ordinance #2017-302 is literally the opposite of this.

Further, we cannot rely on the WVDEP to do the job that good local land use guidelines and zoning should do. For example, the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed states that detention and retention ponds are not recommended on karst and categorize them as discouraged. Also, quoting WVDEP’s own karst guidance: “attenuating surface runoff will increase the rate of sinkhole formation and potential groundwater contamination.” Yet the entity currently planning to utilize this zoning change is planning employment of multiple massive retention ponds and attenuating surface runoff completely. This has already been approved by the DEP in two Construction Stormwater General Permit registrations for that company. One of detention ponds is not even regulated by the DEP as it contains process water and has no outlet. Clearly the DEP recognizes the risks but is not appropriately limiting them. Relying on the DEP to protect the public health, safety, welfare, and the environment from any entity in these karst locations is simply as the CNS bulletin said it “inadequate to safeguard the public and the environment.” We must have appropriate zoning that takes into consideration appropriate use of land with karst

hydrogeology. Ordinance #2017-302 does not do this, but instead increases the risk to the public and the environment.

A second serious concern is the air emissions from the industry that this zoning will provide for. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. These types of air emissions have been shown to increase the risk of, contribute to, and exacerbate a multitude of developmental, physical, physiological, physiological, cognitive and economic. The exposure of one individual can cause repercussions in multiple generations. Embryos, fetuses, and children are most vulnerable with effects born out over a lifetime, and that of their offspring. Many of these effects only require short-term exposure and some have even been shown to occur at levels below current limits recommended by the World Health Organization. Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on Ordinance #2017-302. Ranson's proposed zoning change presents a significant risk to the equine industry in Jefferson County and well beyond. The type of industry that would be allowed by the proposed zoning change in this location would jeopardize horse health, the ground water supply, and workforce productivity. This will cause immediate shrinkage and threaten the long-term viability of the equine industry in the county. In doing so, the industry this zoning change will allow for will adversely affect the health, safety, and welfare of our community.

The site of the proposed rezoning is less than six miles from Charles Town Races, with several breeding, training, and rehabilitation facilities between the two. The industry allowed by this rezoning would produce particulate, gaseous, and hazardous air emissions that would reach these sites. According to the WVDEP air permit, the Rockwool plant in Ranson is permitted to emit 250.87 tons of particulate matter per year into the air (1).

According to a recent study published in the journal of Veterinary Internal Medicine (2), horses are 15 times more sensitive to inhaled particulate matter than humans. Inhaled particulate matter can cause inflammation in horses' lungs that negatively affects performance. Inhaled particulate matter also contributes to the development of inflammatory airway disease (IAD) (3). IAD is a chronic airway disease that can affect horses long after their racing career is over. While there is little research on how other air pollutants affect horses, the effects of pollution on humans can be used to infer potential impact on horses. However unlike human models, these horses are elite athletes continuously exposed, and will thus likely experience detrimental effects at much lower levels of air pollution than humans.

The primary concern with air pollution is that increased levels of pollutants will increase inflammation in horses' lungs. Even small, subclinical amounts of inflammation in the lungs of horses negatively affect performance (2,3,4,5,6,11). This inflammation can also cause increased

recovery times following racing (7,11). Reduced performance and training interruptions can lead to higher risk of injury, reduced winning average, fewer yearly starts, lower yearly earnings, shortened career length, fewer lifetime starts, reduced lifetime earnings, and reduced quality of life (2,3,8,9,11). Each of these situations will lead to decreased return on investment, decreased cash flow, and decreased overall earnings for owners, trainers, and breeders with horses at Charles Town Races and in nearby areas. In this way, the industry this zoning will allow will adversely affect the welfare of our community.

While racing is usually a thoroughbred's first career, it is rarely their last. Some racing horses go on to be breeding stock, while others will have successful careers as sport horses. Jefferson County is an important source of new stock for sport horse trainers from Northern Virginia, and Maryland, and this is a resource for local horseman of both income and placement for horses not appropriate for breeding. However, if retired racehorses are unsound from injury or respiratory disease, they can be difficult to manage as breeding stock or unfit for a career as a sport horse. This affects the horse's quality of life and also places a burden on the industry locally and regionally. In this way, the industry this zoning will provide for will adversely affect the welfare of our community.

The perception of decreased air quality from the increase in regional haze and visible smokestacks as one drives into the county will deter out of state Owners and Breeders from investing in West Virginia bred Race horses, decreasing or eliminating a critical \$50 million a year source of local business volume. In this way, the industry this zoning will provide for will adversely affect the welfare of our community.

Another concern related to the proposed rezoning in Ranson is the risk of groundwater contamination as a result of the karst hydrogeology at the site and the industrial activity. Horsemen will either have to take on the expense of periodically testing water sources or they may not know local ground water is contaminated until their animals are sick. Veterinary care and testing adds expense and uncertainty to an industry that already deals with large inherent risks. The actual occurrence of ground water contamination would be devastating for Jefferson County's equine industry. For both geographic and financial reasons, it is simply impossible to think that the industry could solely use public or private utility-provided water if industrial activity fouled the local groundwater. In this way, the industry this zoning will provide for will adversely affect the health, safety, and welfare of our community.

Finally, studies on US agricultural workers have demonstrated that increased air pollution decreases productivity of outdoors workers. This would place an additional burden on workers, small business owners and the industry. In this way the industry this zoning will provide for will adversely affect the health, safety, and welfare of our community.

The equine industry in Jefferson County is hundreds of years old. It is not worth risking this historic and economically valuable industry by rezoning for industrial companies like Rockwool. An economic impact study of the Charles Town Thoroughbred Horse Racing Industry on Jefferson County's economy found that the spending by owners, breeders, and trainers of the

equine industry directly contributes \$79.4 million to the county each year. Out-of-state owners, breeders, and trainers spend more than \$50 million in Jefferson County every year. The value of total business volume in Jefferson County is \$191 million each year (10). These numbers do not include the effect of the handle or the casino.

The equine industry provides jobs for a broad cross-section of the public. This industry offers individuals of any educational background a variety of paths to achieve a good middle-income living. Many jobs allow individuals to pursue apprenticeships or on-the-job training rather than requiring a costly college education. This flexibility allows for greater lifetime earnings and improved educational debt-to-earnings ratio for these workers. The equine industry also provides opportunities for non-traditional workers by offering job opportunities to those who may not be employable by larger corporations. This industry provides a variety of fulltime, part-time, flexible, and pick-up work. Encouraging this type of flexible job ecosystem helps create a healthy economy with broad participation in employment and consumption.

The equine industry is a large conglomerate of small businesses, which have a multitude of economic benefits over having a few large businesses. It has been extensively reported that small locally owned businesses and start ups create more jobs, cultivate innovation, generate higher incomes, and provide more opportunities for individuals that would otherwise not exist than big non-local firms, which can actually depress local economies. The equine industry provides opportunities for small businesses and startups responsible for this growth of better jobs that are so good for the economy.

The equine industry offers so many other benefits that the industry in the rezoned area would not. For example, the equine industry supports local agriculture by providing a market for agricultural goods such as straw. The robust straw market supported by owners, trainers, and breeders allows for a third cash crop to be produced from one field in a year. Through pastureland and support of local agricultural goods, the equine industry protects and preserves the open spaces that give our county its bucolic quality and help attract tourists. Through the breeders' incentive programs, the equine industry offers unique opportunities to draft state funds back to Jefferson County, to name a few.

Rezoning this area of Ranson for Special District Industrial will allow in entities whose activities are harmful to the equine industry. The losses incurred by the equine industry would far outweigh any benefits derived from industries occupying the rezoned area. Sacrificing the long-term viability of one of our oldest and most productive industries for a net loss in business volume and economic value just does not make good sense for the local economy. This zoning change would provide for industry that would adversely affect the health, safety and welfare of our communities. Please vote NO on Ordinance #2017-302.

Sincerely,

Rebecca Woodward-Davis

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on #2017-302. The air emissions, possibility of ground and surface water contamination, and their effect on our interwoven economies threaten the health, safety and welfare of not just Jefferson County but the greater region, including Loudoun and the greater Northern Virginia area.

This zoning would provide for industry that produces large amounts of air emissions. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. Northern Virginia is directly downwind from these emissions. Much of the gaseous, fine particulate, and hazardous emissions can reach Northern Virginia. Further affecting the outdoor air quality of the adjacent portion of Virginia and the ability of these areas to achieve and maintain National Ambient Air Quality Standards (NAAQS) attainment. This will affect agriculture and outdoor leisure and recreation.

For example, Loudoun County has been in nonattainment for the NAAQS 8-hour Ozone standard for the past two years. VOC and NO_x react after they have been emitted to produce ground level ozone. The industry that this rezoning would provide for would produce large amounts of these emissions. This would make it even harder as Loudoun County tries to achieve attainment. As time goes on and the scientific research advances our knowledge and understanding of the extent to which gaseous, particulate and hazardous emissions affect human health the NAAQS standards are likely to be reduced. The effects on air emission from this rezoning will make it only harder for Loudoun and Northern Virginia to meet these standards.

In addition to the concerns about the air, the possible ground and surface water contamination is very concerning to Loudoun and Virginia residents. The site is known to have ground water that is vulnerable to contamination due to the karst hydrogeology. A USGS study demonstrated that the ground water adjacent to the site to be rezoned communicates readily with surface

water tributaries of the Potomac River. In addition to direct infiltration where water moves directly from the surface to groundwater via porous limestone bedrock, karst is known to have severe ground instability problems. This makes karst geology prone to sinkhole development. Sinkholes provide direct connection between the surface water and any contaminants it may contain and the groundwater. This makes the aquifer vulnerability in karst areas very high, and contamination with industrial activity such as that provided for by this rezoning too likely. In this way, this zoning change will adversely affect the health and welfare of individuals and the community.

Loudoun sources its drinking water from the Potomac River, downstream of many West Virginia tributaries that carry water from the epikarst and groundwater aquifer at the site to be rezoned. Loudoun has recently completed the new Trap Rock Water Treatment facility, which draws water from the Potomac River. Loudoun currently provides 40 million gallons and projects to provide 90 million gallons of drinking water a day to customers by 2040 (Loudounwater.org). Therefore, the viability of the Potomac River is a high priority for Virginia residents.

Loudoun and Northern Virginia is one of the fastest growing communities in the country and provides a lot to Jefferson County in their symbiotic relationship. Virginia residents support and enjoy Jefferson County through tourism, as our residents enjoy the natural and historical resources of your county. Virginia residents and businesses support the equine industry in a multitude of ways from providing wagering fans at the races to the Virginia Breeders Association Virginia Certified incentive programs and a strong market for retired racehorses. According to an economic impact study from WVU, at least 40% of Jefferson County residents travel outside of West Virginia for work, a good percentage of those travel to northern Virginia. This rezoning would allow for industry that would negatively affect the economy of both places and this relationship and the benefits for our residents gleaned from it.

This zoning change will provide for industry that will negatively effect the health safety and welfare of the Loudoun and Northern Virginia community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Sara Vandeginste

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Sarah Milcetic

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Addition to the facts above, I would like to add a personal note. I have lived in Jefferson County for over 10 years. I shop in the Ranson area on a weekly basis. I think that the large majority of people realize that this zoning change is not in accordance with our community. It invites further industry who will pollute more here than elsewhere because they believe that here they can get away with it. Do not allow that.

This issue has divided our community, and it's time to move on. The groundswell of people who are upset about this should tell you that. Please make the right choice, and protect our air, land, especially vulnerable water table, and the most vulnerable in our population. Please vote no.

Regards,

Patrick Laughner

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would negatively affect tourism, economic agility, groundwater quality, and individual health in neighboring municipalities like Shepherdstown. In doing these things the industry that this zoning change provides for will adversely affect the health, safety, and welfare of our community.

Tourism is critically important to Shepherdstown's economy and to the county as a whole. In 2018, tourist spending in the Jefferson County contributed over \$170 million to state and local government revenue and \$213 million in individual earnings. Importantly, most of this money comes from tourists visiting from neighboring states like Virginia, Maryland, and Washington D.C. Out-of-state tourists are largely drawn to Jefferson County because of its reputation for environmental-friendly, sustainable industry. Key elements that support this reputation include the county's pastoral scenery and pristine natural resources. Ordinance #2017-302 will allow industry into Jefferson County that risks harming these elements and dramatically reducing the area's appeal to visitors. The resulting harm to our tourist industry would drive away visitors and decrease state, county, and local revenue. The long-term success of Jefferson County's tourism industry is dependent on local governments making coordinated zoning decisions. Allowing certain types in industry in Ranson will negatively affect tourism in every municipality throughout the county, including Shepherdstown. Voting no on ordinance #2017-302 will protect the foundations of the county's tourism industry and protect the 7,040 jobs in Jefferson County that are directly supported by tourism. In this way, the industry this zoning change will allow will adversely affect the welfare of our community.

The type of large, consolidated industry that ordinance #2017-302 would allow in Ranson would generally reduce the flexibility of local economies in Jefferson County. Historically, the driving industries in Jefferson County have been tourism, agriculture, and the equine industries. These three industries are large conglomerates of small businesses. Small business is very important

to Shepherdstown. Small businesses have been shown to create more jobs, cultivate more innovation, and provide more opportunities than big, non-local firms. Additionally, small businesses have been shown to be more reactive to sudden changes relative to manufacturing businesses. Bringing large, manufacturing-based industry into Jefferson county will depress the local economy and stifle innovation. During this time of economic upheaval and uncertainty, Jefferson County needs to support industries that will allow local economies to adapt and recover as fast as possible.

Voting no on ordinance #2017-302 will help protect water resources throughout Jefferson County. The type of industry that ordinance #2017-302 would allow puts the ground resources of Jefferson county at significant risk due to the karst hydrogeology. The site in Ranson is in the Rocky Marsh Run watershed, which is in the source water protection zone for Shepherdstown and drains to the Potomac River. Therefore, activity at this site will affect both groundwater and surface water streams. In municipalities like Shepherdstown, many residents and nearby farms depend on wells for water. Contamination of groundwater aquifers would create both health and remediation concerns for local residents. Dye tests performed by the USGS near the area of proposed rezoning in Ranson have shown just how far-reaching groundwater contamination at the Ranson site could be. Results from the USGS study revealed measurable dye concentrations in Elk's Run, Rattlesnake Run, and even the Shepherdstown Town Run. This last run cuts through the center of Shepherdstown and is a favorite area for children to play and learn to fish. In this way, the industry that this zoning change will allow will adversely affect the safety of our community.

Groundwater pollution is not the only concern for communities like Shepherdstown. The type of industry that ordinance #2017-302 would allow in Ranson would also generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. These pollutants are particularly harmful to children. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. The site in Ranson is across the road from an elementary school and also within the Jefferson High Middle district. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of children in Shepherdstown and all of Jefferson County. In this way, the industry that this zoning change will provide for will adversely affect the health of our community.

I again request that you vote no on ordinance #2017-302. This zoning change will allow industry that will adversely affect the health, safety, and welfare of our community. The long-term economic, environmental, and community health of municipalities like Shepherdstown depend on Ranson's participation in a coordinated zoning plan for all of Jefferson County.

Sincerely,

Marissa Nuss

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask that you vote no on Ordinance #2017-302. While not in Ranson, the land and homes around the property that is the subject of the zoning change are closer to the property than anyone who currently lives within the city limits of Ranson. This area will be affected sooner and more harshly by the environmental issues that will develop secondary to the inappropriate siting of industry this zoning would allow.

The subject land has been well studied by Drs. Kozar, Doctor and Doctor and described in the scientific literature and USGS reports as having karst hydrology with very high aquifer vulnerability. The karst landscape is a consequence of the presence of soluble bedrock, which consists of limestone in the case of the subject land. In such landscapes water percolates through the ground and dissolves the underlying rock creating a porous network of caverns and throughways. Karst aquifers are known to be "extremely vulnerable to pollution" due to direct connection between the surface water and groundwater through both point (sinkholes) and diffuse (everywhere) infiltration. It is known from the Voluntary Remediation Plan of Jefferson Orchard that the groundwater at the subject site is only 60 feet below the ground. The subject property and much of the property around it are on an upland plain with few surface streams, but great seasonal variability in the water table resulting in numerous esteves and large amounts of water in the epikarst. This water is easily contaminated and this contamination spreads quickly throughout the aquifer. Dye tests performed near the subject site by the USGS have demonstrated this quick moving thorough dispersment in the aquifer in this area. While this contamination goes on to affect springs at the margins of the upland area continuing on in streams that service municipal water sources and the Potomac River, our concerns are far more immediate in both time and distance. Well water is the only water source available in the area of the proposed zoning change and, with the exception of Fox Glen, a majority of this water is supplied by private wells. Therefore, the groundwater aquifer fulfills a critical necessity, fulfilling all needs including human consumption, household uses, and agriculture and

maintenance of livestock and horses in the immediate area around the site. The concern is that if the aquifer becomes contaminated, then the local drinking water will be fouled.

For decades now, policy makers have been using “Aquifer Vulnerability,” to set land use and water resource protection policy. Karst has very high Aquifer Vulnerability. Therefore, this industrial use is not appropriate for this land and it should not be zoned for it. The guiding documents of the WVDEP recognize this. The introduction to the WVDEP document Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.”

The Chesapeake Bay Stormwater Network karst stormwater guidance document the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed, which the WVDEP cites in its own guiding document Stormwater Management Design in Karst Areas, clearly agrees stating:

“First, the effect of land development on karst terrain is complex and hard to predict, and requires professional analysis to reduce the risk of geological hazards, damage to infrastructure and groundwater contamination.” “The working group acknowledges that past approaches to stormwater and land development in karst terrain have been inadequate to safeguard the public and the environment.” “...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” We clearly need stronger comprehensive land use plans and zoning that direct new growth away from karst areas to more appropriate locations. Ordinance #2017-302 is literally the opposite of this.

Further, we cannot rely on the WVDEP to do the job that good local land use guidelines and zoning should do. For example, the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed states that detention and retention ponds are not recommended on karst and categorize them as discouraged. Also, quoting WVDEP’s own karst guidance: “attenuating surface runoff will increase the rate of sinkhole formation and potential groundwater contamination.” Yet the entity currently planning to utilize this zoning change is planning employment of multiple massive retention ponds and attenuating surface runoff completely. This has already been approved by the DEP in two Construction Stormwater General Permit registrations for that company. One of detention ponds is not even regulated by the DEP as it contains process water and has no outlet. Clearly the DEP recognizes the risks but is not appropriately limiting them. Relying on the DEP to protect the public health, safety, welfare, and the environment from any entity in these karst locations is simply as the CNS bulletin said it “inadequate to safeguard the public and the environment.” We must have appropriate zoning that takes into consideration appropriate use of land with karst hydrogeology. Ordinance #2017-302 does not do this, but instead increases the risk to the public and the environment.

A second serious concern is the air emissions from the industry that this zoning will provide for. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. These types of air emissions have been shown to increase the risk of, contribute to, and exacerbate a multitude of developmental, physical, physiological, physiological, cognitive and economic. The exposure of one individual can cause repercussions in multiple generations. Embryos, fetuses, and children are most vulnerable with effects born out over a lifetime, and that of their offspring. Many of these effects only require short-term exposure and some have even been shown to occur at levels below current limits recommended by the World Health Organization. One example of this is that a recent study found that “Even within the limits set by the World Health Organization, the pollutants PM₁₀, SO₂, NO₂, and O₃ are associated with increased risk of treatment for respiratory diseases in children 0 to 6 years of age.” Unfortunately, the US limits are higher than WHO, 300 % higher in the case of PM₁₀!

In fact, in 2019, in the Advice from the Independent Particulate Matter Review Panel (formerly U.S. EPA Clean Air Scientific Advisory Committee Particulate Matter Review Panel) on EPA’s Policy Assessment for the Review of the National Ambient Air Quality Standards for Particulate Matter, it stated that the committee unanimously and unequivocally found that the current primary annual and 24-hour PM_{2.5} National Ambient Air Quality Standards (NAAQS) are not adequate to protect public health. The advice from this 20-member committee, whose scientific disciplines include epidemiology, medicine, toxicology, air quality measurement, air quality modeling, exposure assessment measurement and modeling, risk assessment, statistics, and others, was ignored due presumably to political pressure. Not only are the NAAQS too high in some cases, but due to the measure and mechanism by which they work, they can not replace the safety provided by good land use and zoning regulations, that are meant to do things like keep factories with air emissions and hundreds of heavy trucks away from elementary schools. In fact, there is a state law that prohibits siting a school near a factory. Unfortunately, the reciprocal law does not exist. Clearly, just like with the water resources, we cannot rely on the DEP or the EPA to do the job of what appropriate zoning should do. The whole point of zoning is to keep people safe and provide for their health and welfare. Ordinance #2017-302 puts families and school children directly in harms way.

The air emissions, threat to the groundwater, and the very presence of the industry that this zoning change will allow for will have a serious negative economic effect on those who live and or work closest to the site in question. Productivity and workforce participation will be negatively affected by the health effects of the air emissions. The local agricultural operations will be negatively affected by the air emissions with lower quantity and quality of crop yield and would be devastated if the ground water aquifer were fouled. The equine operations in the area, of which there are several, will be negatively affected by the air emissions as they affect the horses’ health and performance. The mere presence of the industry that will be provided for by this zoning change will cause property values to fall. There will be serious economic consequences for the immediate area around the site in question.

Several of the communities in the immediate area of the site for proposed zoning change are traditionally underserved and have lower economic status. The choice of this location for such a zoning change represents an egregious example of environmental injustice that should not be promulgated or tolerated.

This zoning change will provide for industry that will negatively affect the health safety and welfare of our community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Janet Stevens

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask you to vote NO on Ordinance #2017-302. The industry this zoning change will allow for endangers the health, safety and, welfare of the community, and violates the premise of the smart code zoning that we have spent so much time, effort and federal money employing.

This zoning change will provide for industry that will negatively affect the agriculture industry in Jefferson County and beyond. The combination of the air emissions and threat to the ground water resources could have devastating consequences for the agricultural community of Jefferson County.

The comprehensive plan of Ranson is clear: it states, "the City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community." This land is ill-suited for an industrial facility due to its location and hydrogeology. Further, the industry that this zoning change will allow for will adversely affect the health, safety, and welfare of the community through its affect on the agricultural industry.

The agriculture industry in Jefferson County is hundreds of years old and continues to serve our community well today. According to the economic impact study "A Shared Agenda for Growing West Virginia's Agricultural Economy, Prepared by Fourth Economy for West Virginia Department Of Agriculture West Virginia University Extension Service 2012," Jefferson County is the second highest producing county for crops sales, third highest for fruits and vegetables sales, and in the top 9 counties for sales of animals and animal products.

Agriculture, tourism and the equine industries work synergistically to have an outsized positive impact on the economy in Ranson and Jefferson County as a whole. Agriculture drives tourism by creating agro-tourism opportunities, preserving beautiful open spaces that contribute to the

bucolic nature of our county, and providing the locally produced agriculture goods many tourists are look for in our markets and restaurants. Agriculture also supports the equine industry by providing local products like hay and straw, helping maintain pasture land, co-supporting local dual-purpose retail stores, and helping recycle by products. Agriculture helps maintain the way of life that many those who choose to live in Jefferson County enjoy. Industrial manufacturing and industry this zoning will provide for could never achieve these things.

Local agriculture also provides a source of locally produced agricultural goods. It has become apparent with the current pandemic and health emergency. This became a supply chain crisis because as our supply chains have moved to be ever more lean and efficient they lack resiliency and agility. By having a local source of agricultural goods and food we add resiliency and agility into our own economy and community. The agricultural industry in Jefferson County provides this.

A plethora of scientific studies have shown that a variety of air pollutants produced by the type of industry this zoning change would provide for causes decreased yields of both quantity and quality for several of the crops important to Jefferson County including winter wheat and soybeans. Soybeans and wheat are two of the crops significantly affected and two of the most prevalent crops in Jefferson County. Lower crop yields harm the farms and all the members of the down stream supply chain as well as the consumer. In this way, this zoning change will adversely affect the welfare of the community.

Recent studies have shown that even small increases in air pollution affect the productivity of agricultural workers. Similar to the reduction in crop yield this will negatively affect the individual workers, businesses, consumers and industry as a whole. In this way, this zoning change will adversely affect the health and welfare of individuals and the community.

Even more devastating is the possibility of groundwater contamination. The land at the subject location has karst hydrogeology and as such has porous bedrock and severe ground instability problems. The porous bedrock allows rapid diffuse infiltration of surface water into ground water and the severe ground instability problems leads to sinkhole development. Sinkholes provide direct connection of the surface water with the ground water aquifer through point infiltration. In fact, according to a 2012 study by Doctor and Doctor, the subject location and that of Terrapins Neck have the highest sinkhole vulnerability of any sites in Jefferson County. The propensity and easy of diffuse and point infiltration in areas of karst hydrogeology give them very high aquifer vulnerability meaning the aquifer is very vulnerable to contamination. For this reason, this measure has been used for decades by policymakers to set land use regulations. In this way, this zoning change and the industry it will provide for will adversely affect the welfare of the community.

The WVDEP recognizes development in car karst areas puts water resources high-risk for contamination but also recognizes that this is best protected against true local land use and zoning ordinances. WVDEP's guiding document Stormwater Management Design in Karst Areas

states, "it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." This document also references the Chesapeake Bay Stormwater Network karst stormwater guidance document the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed. In which it states "...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." Land use policy in Ranson and zoning need to take aquifer vulnerability into consideration as these agencies and documents suggest.

The Jefferson Orchards Voluntary Remediation Plan application reports that the ground water is only 60 feet from the surface at the site. It is described in the scientific literature that this land is an upland plane with large amounts of water in the epikarst, and contamination of this water effects the whole aquifer including the communications with surface water streams. A USGS study demonstrated that the groundwater adjacent to the site communicates readily with several surface water structures and wells miles away from the site. The effects of contamination at this site would go well beyond Ranson fouling large portions of the ground water and surface water in Jefferson County.

Groundwater contamination at the site would have devastating effects on the Agricultural industry in Jefferson county. For geographic and economic reasons it is simply infeasible for the agricultural industry to rely on utility provided water. Based on the scientific literature the site being considered for rezoning is one of the areas of highest aquifer vulnerability in Jefferson County and is inappropriate for the industry that this zoning change will provide for. This land is clearly ill-suited for industrial use and should not be zoned for it.

By threatening the local agricultural industry, the industry that this zoning will provide for will threaten the health, safety, and welfare of the community, and this land is not well-suited for industrial use. The Comprehensive Plan in Ranson is clear the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Jennifer Orr

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that will significantly harm the municipalities within Jefferson County and beyond effecting the health, welfare, and safety of our community. Harpers Ferry is a national treasure with the natural and historic resources tours flock to see each year and one of the communities that will be negatively impacted by this zoning change.

According to a 2019 study by the West Virginia Tourism Office, Jefferson County generated an average of \$178 million per year in tourism-derived revenue for state and local governments over the last 10 years, more than any other county in West Virginia by at least double. Tourism benefits the businesses and economy of Ranson and Jefferson County producing \$213.7 million in individual earning, 7040 jobs, and \$842.6 million in direct spending here in 2018. We would need 40 Project Shuttles to replace the individual earnings and 59 Rockwools to replace the jobs provided by the tourism industry in Jefferson County. It is important to note that most of the money generated by tourism in Jefferson County comes from neighboring states. In this way, it is like an export: not simply recycling money, but bringing money into the state increasing its wealth. Much of the economy in Harpers Ferry is based on this tourism industry. A threat to this industry poses a threat to the economy and welfare of our community.

One of the important drivers for tourism in Harpers Ferry is the Appalachian Trail. According to the Appalachian Trail Conservancy (ATC), Harpers Ferry is the psychologic midpoint of the Trail, and hikers often plan extended stays in Jefferson County with an obvious positive impact. The ATC reports that the smokestacks and associated lights will be visible in the viewshed of 15 vistas on the Appalachian Trail (AT). Studies have shown that quality of vistas and human impact on the environment are not only noticed by visitors, but effect their experience. Another study published in the Journal of Applied Recreation Research, found that points of interests and views drew visitors' attention and had a significant impact on their perception of the trail. It was also found that particularly beautiful vistas helped visitors overlook elements

that usually have a negative effect on trail experience like increased trail traffic. A 2009 study in Leisure Sciences revealed that scenic value was a perceptual theme of Appalachian Trail visitors, and that things as simple as dead trees visible in a vista can have a negative impact on visitors' overall perception. Imagine the effect the smokestacks will have from the 15 vistas from which they will be visible. The introduction of industrial activity made possible by the proposed rezoning in Ranson would have a negative effect on the scenic views of beautiful landscapes from the Appalachian Trail in Jefferson County.

The smokestacks are not all visitors will be able to see — the air pollution will create haze. The effect of regional haze on tourists was explored in a review article published in the Atmospheric Environment titled "Impaired visibility: the air pollution people see." A key takeaway on the negative affect of haze on vacationing tourists was summarized as follows:

"Vacations offer an escape from the routine and stress of our daily lives. Vacation destinations are often chosen based on their scenery; vacations are spent gazing at monuments, mountains, clouds, and oceans. Good visibility allows clear observation of distant features and appreciation of the inherent beauty of these scenes...Air pollution, which is often present in both our cities and parks, interferes with these attributes and can ruin the views vacationers travel to enjoy."

People seek bucolic, unspoiled areas to escape the stresses of urban areas. A 2004 study in Environment and Behavior found perceived pollution causes stress while viewing natural scenes has both psychological and physiological benefits, and a 2007 study confirmed these benefits. Two other studies found that people are emotionally affected by poor visibility, and tourists are disappointed when views are obscured by haze.

The combination of smokestacks and haze will mar the viewshed and will not only reduce the positive effects of a scenic landscape but also leave tourists disappointed and dissatisfied with their choice of destination. With these effects the welfare of the Harpers Ferry community would undoubtedly be endangered by the industry that this zoning change will provide for.

Multiple studies by doctors Kozar, Doctor, and Doctor have demonstrated that the land at this site to be rezoned is Karst with the highest likelihood of sinkhole development in the county, and that the groundwater aquifer there is incredibly sensitive to contamination from surface water. Further, this site is on an upland plain with relatively few surface streams, seasonal variability in the water table that results in numerous estavelles, and large amounts of water in the epikarst. In this area contamination in surface water communicates easily to the water in the epikarst via diffuse and point infiltration, and the springs at the margins of the upland area are directly affected by the water quality throughout the aquifer. According to Jefferson Orchards Voluntary Remediation Plan with the WVDEP, the groundwater at the site is approximately 60 feet below the ground, and the tests performed by the USGS have shown that groundwater from just adjacent to this site emerged in the headwaters of both the Elk's Run and Rattlesnake Run. This is critically important for Harpers Ferry because the Elk's Run headwaters is a spring about three miles southeast of the site and goes on to become the drinking water source for Harpers Ferry and Bolivar before emptying into the Potomac River.

The headwaters of Rattlesnake Run is a spring about 3.5 miles from the site and is also a tributary of the Potomac River. The Potomac River is the back up water source for Harpers Ferry. This means that the activity at the site will have a critical influence on the drinking water of Harpers Ferry. In this was the industry permitted by this change in zoning would undoubtedly endanger the health and safety of the community in Harpers Ferry.

The untoward health effects and individual economic consequences from the pollution emissions of the industry this rezoning will allow that will be born out over the length of people's lives and that of their decedents for at least three generations is an egregious example of environmental injustice that should not be tolerated. This zoning change may be in one of the poorest sections of the county, but the effects will be felt in every part of Ranson and the county.

The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." The industry that this rezoning will allow will jeopardize the health, safety and welfare of Ranson, Harpers Ferry and the whole county. Please vote no on the ordinance #2017-302.

Sincerely,

Roseann Brown

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would negatively affect tourism, economic agility, groundwater quality, and individual health in neighboring municipalities like Shepherdstown. In doing these things the industry that this zoning change provides for will adversely affect the health, safety, and welfare of our community.

Tourism is critically important to Shepherdstown's economy and to the county as a whole. In 2018, tourist spending in the Jefferson County contributed over \$170 million to state and local government revenue and \$213 million in individual earnings. Importantly, most of this money comes from tourists visiting from neighboring states like Virginia, Maryland, and Washington D.C. Out-of-state tourists are largely drawn to Jefferson County because of its reputation for environmental-friendly, sustainable industry. Key elements that support this reputation include the county's pastoral scenery and pristine natural resources. Ordinance #2017-302 will allow industry into Jefferson County that risks harming these elements and dramatically reducing the area's appeal to visitors. The resulting harm to our tourist industry would drive away visitors and decrease state, county, and local revenue. The long-term success of Jefferson County's tourism industry is dependent on local governments making coordinated zoning decisions. Allowing certain types in industry in Ranson will negatively affect tourism in every municipality throughout the county, including Shepherdstown. Voting no on ordinance #2017-302 will protect the foundations of the county's tourism industry and protect the 7,040 jobs in Jefferson County that are directly supported by tourism. In this way, the industry this zoning change will allow will adversely affect the welfare of our community.

The type of large, consolidated industry that ordinance #2017-302 would allow in Ranson would generally reduce the flexibility of local economies in Jefferson County. Historically, the driving industries in Jefferson County have been tourism, agriculture, and the equine industries. These three industries are large conglomerates of small businesses. Small business is very important

to Shepherdstown. Small businesses have been shown to create more jobs, cultivate more innovation, and provide more opportunities than big, non-local firms. Additionally, small businesses have been shown to be more reactive to sudden changes relative to manufacturing businesses. Bringing large, manufacturing-based industry into Jefferson county will depress the local economy and stifle innovation. During this time of economic upheaval and uncertainty, Jefferson County needs to support industries that will allow local economies to adapt and recover as fast as possible.

Voting no on ordinance #2017-302 will help protect water resources throughout Jefferson County. The type of industry that ordinance #2017-302 would allow puts the ground resources of Jefferson county at significant risk due to the karst hydrogeology. The site in Ranson is in the Rocky Marsh Run watershed, which is in the source water protection zone for Shepherdstown and drains to the Potomac River. Therefore, activity at this site will affect both groundwater and surface water streams. In municipalities like Shepherdstown, many residents and nearby farms depend on wells for water. Contamination of groundwater aquifers would create both health and remediation concerns for local residents. Dye tests performed by the USGS near the area of proposed rezoning in Ranson have shown just how far-reaching groundwater contamination at the Ranson site could be. Results from the USGS study revealed measurable dye concentrations in Elk's Run, Rattlesnake Run, and even the Shepherdstown Town Run. This last run cuts through the center of Shepherdstown and is a favorite area for children to play and learn to fish. In this way, the industry that this zoning change will allow will adversely affect the safety of our community.

Groundwater pollution is not the only concern for communities like Shepherdstown. The type of industry that ordinance #2017-302 would allow in Ranson would also generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. These pollutants are particularly harmful to children. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. The site in Ranson is across the road from an elementary school and also within the Jefferson High Middle district. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of children in Shepherdstown and all of Jefferson County. In this way, the industry that this zoning change will provide for will adversely affect the health of our community.

I again request that you vote no on ordinance #2017-302. This zoning change will allow industry that will adversely affect the health, safety, and welfare of our community. The long-term economic, environmental, and community health of municipalities like Shepherdstown depend on Ranson's participation in a coordinated zoning plan for all of Jefferson County.

Sincerely,

Gwen Nuss

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Lisa Posey

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask that you vote no on Ordinance #2017-302. While not in Ranson, the land and homes around the property that is the subject of the zoning change are closer to the property than anyone who currently lives within the city limits of Ranson. This area will be affected sooner and more harshly by the environmental issues that will develop secondary to the inappropriate siting of industry this zoning would allow.

The subject land has been well studied by Drs. Kozar, Doctor and Doctor and described in the scientific literature and USGS reports as having karst hydrology with very high aquifer vulnerability. The karst landscape is a consequence of the presence of soluble bedrock, which consists of limestone in the case of the subject land. In such landscapes water percolates through the ground and dissolves the underlying rock creating a porous network of caverns and throughways. Karst aquifers are known to be "extremely vulnerable to pollution" due to direct connection between the surface water and groundwater through both point (sinkholes) and diffuse (everywhere) infiltration. It is known from the Voluntary Remediation Plan of Jefferson Orchard that the groundwater at the subject site is only 60 feet below the ground. The subject property and much of the property around it are on an upland plain with few surface streams, but great seasonal variability in the water table resulting in numerous esteves and large amounts of water in the epikarst. This water is easily contaminated and this contamination spreads quickly throughout the aquifer. Dye tests performed near the subject site by the USGS have demonstrated this quick moving thorough dispersment in the aquifer in this area. While this contamination goes on to affect springs at the margins of the upland area continuing on in streams that service municipal water sources and the Potomac River, our concerns are far more immediate in both time and distance. Well water is the only water source available in the area of the proposed zoning change and, with the exception of Fox Glen, a majority of this water is supplied by private wells. Therefore, the groundwater aquifer fulfills a critical necessity, fulfilling all needs including human consumption, household uses, and agriculture and

maintenance of livestock and horses in the immediate area around the site. The concern is that if the aquifer becomes contaminated, then the local drinking water will be fouled.

For decades now, policy makers have been using “Aquifer Vulnerability,” to set land use and water resource protection policy. Karst has very high Aquifer Vulnerability. Therefore, this industrial use is not appropriate for this land and it should not be zoned for it. The guiding documents of the WVDEP recognize this. The introduction to the WVDEP document Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.”

The Chesapeake Bay Stormwater Network karst stormwater guidance document the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed, which the WVDEP cites in its own guiding document Stormwater Management Design in Karst Areas, clearly agrees stating:

“First, the effect of land development on karst terrain is complex and hard to predict, and requires professional analysis to reduce the risk of geological hazards, damage to infrastructure and groundwater contamination.” “The working group acknowledges that past approaches to stormwater and land development in karst terrain have been inadequate to safeguard the public and the environment.” “...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” We clearly need stronger comprehensive land use plans and zoning that direct new growth away from karst areas to more appropriate locations. Ordinance #2017-302 is literally the opposite of this.

Further, we cannot rely on the WVDEP to do the job that good local land use guidelines and zoning should do. For example, the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed states that detention and retention ponds are not recommended on karst and categorize them as discouraged. Also, quoting WVDEP’s own karst guidance: “attenuating surface runoff will increase the rate of sinkhole formation and potential groundwater contamination.” Yet the entity currently planning to utilize this zoning change is planning employment of multiple massive retention ponds and attenuating surface runoff completely. This has already been approved by the DEP in two Construction Stormwater General Permit registrations for that company. One of detention ponds is not even regulated by the DEP as it contains process water and has no outlet. Clearly the DEP recognizes the risks but is not appropriately limiting them. Relying on the DEP to protect the public health, safety, welfare, and the environment from any entity in these karst locations is simply as the CNS bulletin said it “inadequate to safeguard the public and the environment.” We must have appropriate zoning that takes into consideration appropriate use of land with karst hydrogeology. Ordinance #2017-302 does not do this, but instead increases the risk to the public and the environment.

A second serious concern is the air emissions from the industry that this zoning will provide for. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. These types of air emissions have been shown to increase the risk of, contribute to, and exacerbate a multitude of developmental, physical, physiological, physiological, cognitive and economic. The exposure of one individual can cause repercussions in multiple generations. Embryos, fetuses, and children are most vulnerable with effects born out over a lifetime, and that of their offspring. Many of these effects only require short-term exposure and some have even been shown to occur at levels below current limits recommended by the World Health Organization. One example of this is that a recent study found that “Even within the limits set by the World Health Organization, the pollutants PM₁₀, SO₂, NO₂, and O₃ are associated with increased risk of treatment for respiratory diseases in children 0 to 6 years of age.” Unfortunately, the US limits are higher than WHO, 300 % higher in the case of PM₁₀!

In fact, in 2019, in the Advice from the Independent Particulate Matter Review Panel (formerly U.S. EPA Clean Air Scientific Advisory Committee Particulate Matter Review Panel) on EPA’s Policy Assessment for the Review of the National Ambient Air Quality Standards for Particulate Matter, it stated that the committee unanimously and unequivocally found that the current primary annual and 24-hour PM_{2.5} National Ambient Air Quality Standards (NAAQS) are not adequate to protect public health. The advice from this 20-member committee, whose scientific disciplines include epidemiology, medicine, toxicology, air quality measurement, air quality modeling, exposure assessment measurement and modeling, risk assessment, statistics, and others, was ignored due presumably to political pressure. Not only are the NAAQS too high in some cases, but due to the measure and mechanism by which they work, they can not replace the safety provided by good land use and zoning regulations, that are meant to do things like keep factories with air emissions and hundreds of heavy trucks away from elementary schools. In fact, there is a state law that prohibits siting a school near a factory. Unfortunately, the reciprocal law does not exist. Clearly, just like with the water resources, we cannot rely on the DEP or the EPA to do the job of what appropriate zoning should do. The whole point of zoning is to keep people safe and provide for their health and welfare. Ordinance #2017-302 puts families and school children directly in harms way.

The air emissions, threat to the groundwater, and the very presence of the industry that this zoning change will allow for will have a serious negative economic effect on those who live and or work closest to the site in question. Productivity and workforce participation will be negatively affected by the health effects of the air emissions. The local agricultural operations will be negatively affected by the air emissions with lower quantity and quality of crop yield and would be devastated if the ground water aquifer were fouled. The equine operations in the area, of which there are several, will be negatively affected by the air emissions as they affect the horses’ health and performance. The mere presence of the industry that will be provided for by this zoning change will cause property values to fall. There will be serious economic consequences for the immediate area around the site in question.

Several of the communities in the immediate area of the site for proposed zoning change are traditionally underserved and have lower economic status. The choice of this location for such a zoning change represents an egregious example of environmental injustice that should not be promulgated or tolerated.

This zoning change will provide for industry that will negatively affect the health safety and welfare of our community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Brian Eddy

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote NO on Ordinance #2017-302. This rezoning will put an undue hardship on the wastewater treatment systems, burden the rate payers and risk surface waterways in Charles Town, risking the health, safety and welfare of the community. The comprehensive plan of Ranson states, the City "will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community." Therefore, please vote NO on #2017-302.

The nature of the industry that this zoning will allow will be harmful to our local economy. Charles Town has spent a lot of time and money improving our downtown area for restaurants and retail. We are working to take advantage of the tourism industry in our county and bring more people into Charles Town. The eye sore, noise pollution, air pollution, and obvious move away from sustainability will drive people away from Jefferson County and Charles Town, rendering our efforts ineffective and unrewarding. This will make it harder for our small businesses to be successful. In this way, the industry this zoning will provide for will adversely affect the welfare of our community.

According to the 2018 WVU economic study of the eastern panhandle, over 40% of the workforce in Jefferson County choose to work outside of the state. These commuters bring that money home and spend it here supporting our local small businesses, economy and government. Charles Town has a large number of residents who commute. These typically higher earners may choose to leave the area because of the presence of the industry that this zoning change would provide for. This will cause a hardship on our economy and municipality. In this way, the industry this zoning will provide for will adversely affect the welfare of our community.

The industry that this zoning will allow will cause stress for multiple reasons on the Charles Town wastewater treatment systems and the surface waterways in Jefferson County and

beyond. The industry currently planning to utilize the zoning change will have discharge to the wastewater system that is high in chloride, primarily from its water softening system. The NPDES permit modification allows up to 5,000 mg/L. Chloride is not settled or removed at the wastewater treatment plant. It cannot be removed by conventional means and would be prohibitively expensive to do by new technology. This is of concern to Charles Town because chloride can harm stream water and also impair functioning of the wastewater treatment plant. Furthermore, the corrosive nature of chloride can cause damage to pipes both in the wastewater system and those used by downstream drinking water systems, like the \$207 million Trap Rock Water Treatment plant in Loudoun.

The human health criteria for chloride under WV standards is 250 mg/L. Under low stream flow conditions, chloride additions to the treatment plant effluent, as proposed by the industry currently planning to utilize the zoning change, could cause chloride levels in Evitts Run to exceed this standard. If the amount of chloride increased due to expansion or higher throughput, then this human health standard would be violated frequently. Chlorides are also known to harm aquatic life and effect metal toxicity in rivers. The USEPA and several states have surface water guidelines of 230mg/L for chronic exposure. This would also pose a risk of damaging the water treatment facilities downstream on the Potomac River.

A research study by Lefebvre and Moletta in 2006 showed that chloride and salinity impair the ability of wastewater treatment to remove phosphorus and nitrogen, and because of this, other states have introduced legislation to treat saline wastewater. Uygur and Kargi in 2004 looked at the effects of salt on synthetic wastewater treatment. They found that removal of both nitrogen and phosphorus was reduced when salinity increased from 0 to 6%. In fact, the removal efficiency of ammonia dropped from 96% to 39% with this increasing salinity. Hong et al. In 2016 found phosphorous removal decreased 20-28% when chloride concentrations went from 150 mg/L to 1,500 mg/L. Phosphorous removal was completely inhibited at concentrations greater than 2,500 mg/L. This increased salinity has the potential to make the Charles Town wastewater treatment system work far less efficiently.

In addition to the contents of the wastewater this type of industry will produce, the volume of sewage is itself a concern. Given that the City of Charles Town has been in violation of its permit on numerous occasions for spills and overflow of untreated sewage, adding large volumes of wastewater will further challenge the near capacity system. This will mean that costly capacity upgrades will need to be done likely sooner than they would have needed to be done, imposing further financial strain on the system. Through these effects, the industry this zoning will provide for will adversely effect the health, safety, and welfare of the community.

This zoning change will provide for industry the likes of which are not present in this county and have not been present in this county for many decades. We find it appalling that the introduction of zoning for such industry is being done in an area of the county that is historically underserved and lower income. It is even more egregious because the worst effects including air pollution and groundwater contamination will be felt first and most severely in the immediate vicinity, and Ranson does not even have residents in the immediate vicinity of the

proposed zoning change. This decision is being contemplated without representation of those who will be most affected. This would be a deplorable example of environmental injustice.

This zoning will provide for industry that will harm our economy, drive away residents, challenge and or damage our infrastructure, and may damage our waterways and wild life. Through these effects, the industry this zoning would allow will adversely effect the health, safety, and welfare of our community. This is being done with out representation of those it will affect the most. Please vote No on Ordinance #2017-302.

Sincerely,

Rachel Nelson

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Tracey Moody

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would put at risk the health and well being of children of Jefferson County.

The type of industry that ordinance #2017-302 would allow in Ranson would generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. Exposure to these pollutants has devastating effects on children's health. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. Developing fetuses whose mothers are exposed to air pollution are more likely to have impaired organ development which can lead to early cognitive deficits, neurodevelopmental defects and other physical, cognitive, and psychological deficits later in life. An association between autism and prenatal exposure to particulate matter in air pollution has been demonstrated in several studies. Many studies have shown that lower test scores in math, English, and language arts are associated with exposure to outdoor air pollution. Industrial activity allowed by ordinance #2017-302 would also increase the risk of groundwater contamination in Ranson and nearby municipalities. Children whose families rely on well water, as is the case in much of Jefferson County, may be affected by polluted water. Voting no on ordinance #2017-302 will prevent air and water pollution from negatively affecting the long-term health of children in Jefferson County and surrounding areas.

The economic and environmental harm caused by the type of industry that ordinance #2017-302 would allow would put additional stress on the parents, caretakers, and teachers of children in affected areas. The weakening and destabilizing of this support network would have negative effects on local children. Many households in Jefferson County depend on the local agriculture, tourism, and equine industries for income. If industrial activity in Ranson depresses these industries, the resulting financial strain on these households will introduce additional stress and uncertainty into children's lives. Households living in areas affected by particulate

matter and regional haze will also suffer from the psychological effects of air pollution. Individuals living in areas with increase perception of pollution show increased levels of stress, anxiety, and unhappiness. School districts affected by increased air and water pollution may have trouble recruiting and retaining teachers. Teachers have a large influence on a child's daily life and, if educator quality and tenure decreases, the quality of this influence will diminish.

The site of the proposed rezoning in Ranson is across the road from an elementary school and proximal to lower-income neighborhoods. Observations like these demonstrate how ordinance #2017-302 would disproportionately affect vulnerable and historically-disadvantaged populations. The damaging health effects of air pollution have been shown to persist for at least three generations, so allowing certain types of industry in low-income areas would only compound existing disadvantages. Voting no on ordinance #2017-302 would be a step towards acknowledging that all individuals have the right to clean air and water.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." This zoning change would clearly adversely affect the health, safety, and welfare of the community. Children face increased exposure to air pollution adversely affecting their health, financial instability adversely affecting their welfare, groundwater contamination adversely affecting their safety, and environmental injustice and discrimination if ordinance #2017-302 is passed. Educators will face increased air pollution adversely affecting their health and consequently welfare. These adverse effects are all against Ranson's Comprehensive Plan. Please vote NO on Ordinance #2017-302.

Sincerely,

Alison Moody

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would put at risk the health and well being of children of Jefferson County.

The type of industry that ordinance #2017-302 would allow in Ranson would generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. Exposure to these pollutants has devastating effects on children's health. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. Developing fetuses whose mothers are exposed to air pollution are more likely to have impaired organ development which can lead to early cognitive deficits, neurodevelopmental defects and other physical, cognitive, and psychological deficits later in life. An association between autism and prenatal exposure to particulate matter in air pollution has been demonstrated in several studies. Many studies have shown that lower test scores in math, English, and language arts are associated with exposure to outdoor air pollution. Industrial activity allowed by ordinance #2017-302 would also increase the risk of groundwater contamination in Ranson and nearby municipalities. Children whose families rely on well water, as is the case in much of Jefferson County, may be affected by polluted water. Voting no on ordinance #2017-302 will prevent air and water pollution from negatively affecting the long-term health of children in Jefferson County and surrounding areas.

The economic and environmental harm caused by the type of industry that ordinance #2017-302 would allow would put additional stress on the parents, caretakers, and teachers of children in affected areas. The weakening and destabilizing of this support network would have negative effects on local children. Many households in Jefferson County depend on the local agriculture, tourism, and equine industries for income. If industrial activity in Ranson depresses these industries, the resulting financial strain on these households will introduce additional stress and uncertainty into children's lives. Households living in areas affected by particulate

matter and regional haze will also suffer from the psychological effects of air pollution. Individuals living in areas with increase perception of pollution show increased levels of stress, anxiety, and unhappiness. School districts affected by increased air and water pollution may have trouble recruiting and retaining teachers. Teachers have a large influence on a child's daily life and, if educator quality and tenure decreases, the quality of this influence will diminish.

The site of the proposed rezoning in Ranson is across the road from an elementary school and proximal to lower-income neighborhoods. Observations like these demonstrate how ordinance #2017-302 would disproportionately affect vulnerable and historically-disadvantaged populations. The damaging health effects of air pollution have been shown to persist for at least three generations, so allowing certain types of industry in low-income areas would only compound existing disadvantages. Voting no on ordinance #2017-302 would be a step towards acknowledging that all individuals have the right to clean air and water.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." This zoning change would clearly adversely affect the health, safety, and welfare of the community. Children face increased exposure to air pollution adversely affecting their health, financial instability adversely affecting their welfare, groundwater contamination adversely affecting their safety, and environmental injustice and discrimination if ordinance #2017-302 is passed. Educators will face increased air pollution adversely affecting their health and consequently welfare. These adverse effects are all against Ranson's Comprehensive Plan. Please vote NO on Ordinance #2017-302.

Sincerely,

Keith Moody

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302.

I grew up in upstate NY where an industry poisoned the aquifer because, eventually, the liners wore out. It is a toxic superfund site and a cancer hot spot. This in a geology much better suited to industry in that it does not have a karst system. The short term economics may seem attractive to investors; but, in the long term will burden the city and the county with, amongst other liabilities, increased health costs, population flight, and decreased property values.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, "the City will designate ample land that is well-suited for industrial facilities." This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Aline Schelling

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask you to vote NO on Ordinance #2017-302. The industry this zoning change will allow for endangers the health, safety and, welfare of the community, and violates the premise of the smart code zoning that we have spent so much time, effort and federal money employing.

Any change in zoning needs to align with the comprehensive plan. In Ranson's current comprehensive plan (2012), the city only refers to "heavy industry" in the history section. Here it is characterized as part of a bygone era that has been replaced by an emphasis on agriculture for local food production, open spaces, and quality-of-life. In the remainder of the document, the word industry is used loosely to describe businesses including flower shops and shoe stores. Nothing that resembles the industry that this zoning change will provide for is described in the current comprehensive plan of Ranson.

In the land use section of the comprehensive plan, number ten states:

"Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The comprehensive plan clearly states that the city will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community. This change in zoning clearly negatively affects the health, safety, and welfare of the community.

As the zoning is proposed, the industry that this zoning change will allow for will be directly across the street from houses, parks and other small businesses. A densely populated subdivision and an elementary school already exit directly across the street. While these latter

community sections are not in the city limits, the effect of this zoning on them should still be considered just the same as it would be if they were in the city limits.

The industry that this zoning change will provide for will produce particulate, gaseous, and hazardous air emissions. These emissions have been shown to be detrimental to human health at every stage of life from embryo to old age. In utero and childhood exposure are the most damaging with lasting effects being realized through out life, and with maternal exposure the effects can be felt for generations. Multiple organ systems are affected including respiratory, cardiovascular, neurologic, immune, and endocrine causing defects in multiple processes including in utero development, neurodevelopment, immune and tolerance development, and cognitive defects. There are also psychological, social, and economic effects from both perceived and actual air pollution in both children and adults. Many of these effects can be seen even with short-term exposure or exposure that is lower than the levels recommended by the US Environmental Protection Agency and World Health Organization. These consequences are devastating to the individual and depressing to the local community and economy. State law does not allow a school to be built next to industry that this zoning will allow but yet we are contemplating changing the zoning so this industry can build next to a school. This does not make sense. As Ranson residents, we want Ranson to follow the lead of the state and keep polluting industry away from kids. In these ways, this change in zoning will negatively affect the health and welfare of the community.

In addition to the health effects of the air emissions is the threat to groundwater from the industry that this zoning change would allow. The land in question has karst hydrogeology and therefore very high aquifer vulnerability and is not appropriate for this industry. With the type of industry this zoning will provide for, combined with high aquifer vulnerability, the likelihood of groundwater contamination is too high for the community and region to bear. A USGS study demonstrated that contamination in the groundwater adjacent to the site moves relatively quickly and can be found in wells and surface water structures in a variety of locations in the County. In this way, contamination at the site would affect the drinking water of the great majority of Jefferson County residents. Through the surface water connections, the water at the site also affects the water resources of the region.

Aquifer vulnerability has been used by policy makers for decades to set land use regulations. The guiding document, from the WVDEP, Stormwater Management Design in Karst Areas states, "it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." In Ranson, we need to follow this advice and not change the zoning of this land for use by industry that has among the highest aquifer vulnerability in the County. This zoning change will endanger the safety of the community and region by endangering the safe water resources. As Ranson residents, we want to safeguard the water resources of the county and region by following the WVDEP guidance here.

Further, by reallocating this transect district and replacing it with a monolithic block of Special District Industrial designation, hundreds of housing units, parks and space for small businesses are lost. Ranson loses the potential for property tax on these properties and their improvements, Business and Occupational tax on the businesses and sales tax in retail stores. The community loses out on the opportunity to develop affordable housing and create locations where people can live, work, play, and shop all in the same place reducing the need for travel.

Worse yet apparently a deal has been made where the entity that owns the subject land has required that a litany of things not be built on the adjacent land essentially stripping the purpose of the smart code transect zone that exists there. Transect zones in the smart code are meant to transition, from out to in, and provide communities where people can safely work and live in close proximity in an effort to reduce travel. Excluding many of the components of the transect zone effectively eliminates the features that make it a transect zone, thus, losing the benefits a transect zone offers the community and city. By losing these benefits, reducing the overall and affordable housing prospects, and reducing so drastically the opportunities for city income, this zoning change will negatively affect the welfare of the community.

As Ranson residents, we find it odd that we are changing zoning to provide for industry that we would not put in the middle of our town close to our residents, but we are placing it close to the homes of county residents. Further, it is striking that the area where this change in zoning is directly adjacent to historically underserved lower income communities and a Title I school. This amounts to environmental injustice and cannot be tolerated.

The purpose of zoning is for a city to protect the health, welfare, morals and safety of the community. In this case, the air emissions and heavy truck traffic will endanger the communities' health. The threat of water contamination will endanger the safety of the community. The effect of lost productivity and decreased workforce participation due to increased illness and the negative effect the air emissions and presence of such a factory will have on the local economy will negatively affect the welfare of the community. The environmental injustice of changing the zoning to accommodate such polluting industry in a location where your municipality has no residents, but yet hundreds of low income and underserved county residents live is egregiously amoral. This must not happen. We respectfully implore you to do the right thing and vote no on ordinance #2017-302.

Sincerely,

Melissa Frey

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would negatively affect tourism, economic agility, groundwater quality, and individual health in neighboring municipalities like Shepherdstown. In doing these things the industry that this zoning change provides for will adversely affect the health, safety, and welfare of our community.

Tourism is critically important to Shepherdstown's economy and to the county as a whole. In 2018, tourist spending in the Jefferson County contributed over \$170 million to state and local government revenue and \$213 million in individual earnings. Importantly, most of this money comes from tourists visiting from neighboring states like Virginia, Maryland, and Washington D.C. Out-of-state tourists are largely drawn to Jefferson County because of its reputation for environmental-friendly, sustainable industry. Key elements that support this reputation include the county's pastoral scenery and pristine natural resources. Ordinance #2017-302 will allow industry into Jefferson County that risks harming these elements and dramatically reducing the area's appeal to visitors. The resulting harm to our tourist industry would drive away visitors and decrease state, county, and local revenue. The long-term success of Jefferson County's tourism industry is dependent on local governments making coordinated zoning decisions. Allowing certain types in industry in Ranson will negatively affect tourism in every municipality throughout the county, including Shepherdstown. Voting no on ordinance #2017-302 will protect the foundations of the county's tourism industry and protect the 7,040 jobs in Jefferson County that are directly supported by tourism. In this way, the industry this zoning change will allow will adversely affect the welfare of our community.

The type of large, consolidated industry that ordinance #2017-302 would allow in Ranson would generally reduce the flexibility of local economies in Jefferson County. Historically, the driving industries in Jefferson County have been tourism, agriculture, and the equine industries. These three industries are large conglomerates of small businesses. Small business is very important

to Shepherdstown. Small businesses have been shown to create more jobs, cultivate more innovation, and provide more opportunities than big, non-local firms. Additionally, small businesses have been shown to be more reactive to sudden changes relative to manufacturing businesses. Bringing large, manufacturing-based industry into Jefferson county will depress the local economy and stifle innovation. During this time of economic upheaval and uncertainty, Jefferson County needs to support industries that will allow local economies to adapt and recover as fast as possible.

Voting no on ordinance #2017-302 will help protect water resources throughout Jefferson County. The type of industry that ordinance #2017-302 would allow puts the ground resources of Jefferson county at significant risk due to the karst hydrogeology. The site in Ranson is in the Rocky Marsh Run watershed, which is in the source water protection zone for Shepherdstown and drains to the Potomac River. Therefore, activity at this site will affect both groundwater and surface water streams. In municipalities like Shepherdstown, many residents and nearby farms depend on wells for water. Contamination of groundwater aquifers would create both health and remediation concerns for local residents. Dye tests performed by the USGS near the area of proposed rezoning in Ranson have shown just how far-reaching groundwater contamination at the Ranson site could be. Results from the USGS study revealed measurable dye concentrations in Elk's Run, Rattlesnake Run, and even the Shepherdstown Town Run. This last run cuts through the center of Shepherdstown and is a favorite area for children to play and learn to fish. In this way, the industry that this zoning change will allow will adversely affect the safety of our community.

Groundwater pollution is not the only concern for communities like Shepherdstown. The type of industry that ordinance #2017-302 would allow in Ranson would also generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. These pollutants are particularly harmful to children. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. The site in Ranson is across the road from an elementary school and also within the Jefferson High Middle district. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of children in Shepherdstown and all of Jefferson County. In this way, the industry that this zoning change will provide for will adversely affect the health of our community.

I again request that you vote no on ordinance #2017-302. This zoning change will allow industry that will adversely affect the health, safety, and welfare of our community. The long-term economic, environmental, and community health of municipalities like Shepherdstown depend on Ranson's participation in a coordinated zoning plan for all of Jefferson County.

Sincerely,

Judith Goodrich

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask that you vote no on Ordinance #2017-302. This zoning change to allow heavy industry does not align with the comprehensive plan of Ranson because it will adversely affect the health, safety, or welfare of the community. I am a watershed ecologist and restoration professional, and also a parent of a child who is slated to attend North Jefferson Elementary School. This decision affects me personally, and I have concerns that are shaped by my professional history as well.

I've worked with municipalities, landowners, conservation groups, state and federal agencies, to protect and improve stream and ground water quality. It is far more cost effective in the long run to protect a resource than it is to attempt to remove pollution once it has happened. Jefferson County has an abundance of groundwater, which is a valuable asset. It is also very sensitive to pollution because of karst geology and sinkholes. Groundwater is only 60 feet from the surface at Jefferson Orchards, and studies have shown that groundwater this particular location is highly interconnected with ground and surface water across the county. If this were to be contaminated, it would be nearly impossible to return it to the state it is now, and would put thousands of private water wells and several municipal drinking water systems at risk. There is a wealth of information, both scientific studies and location –specific data, about the risks to groundwater at this site. For example, Jefferson Orchards is adjacent to the area of highest sinkhole density in the county (Doctor DH, and Doctor KZ. 2012). Others will explain karst and groundwater concerns in detail in their letters. I urge you to take these concerns seriously. Industry in this location is a risk not worth taking.

Please do better than our own Department of Environmental Protection, and do not fall back on the fallacy that they have 'blessed' this project, because it is clear that the WVDEP has been prioritizing the desires of industry over the interests of residents and the environment. As someone who has worked closely with state agency staff in other states, that is not an easy statement to make; it took me almost two years of correspondence and close tracking of the

water permitting program of WVDEP to be able to write such a strong statement. But the WVDEP overlooked major issues with Rockwool's permitting, and did so in a way that may have been intentional.

It is your responsibility to do the due diligence to ensure this zoning change is appropriate, and it is your duty to look out for the needs of residents. This change to allow industry in an area of such high geological vulnerability is clearly inappropriate.
Please vote no on ordinance #2017-302.

Sincerely,

Lori Maloney

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that will significantly harm the municipalities within Jefferson County and beyond effecting the health, welfare, and safety of our community. Harpers Ferry is a national treasure with the natural and historic resources tours flock to see each year and one of the communities that will be negatively impacted by this zoning change.

According to a 2019 study by the West Virginia Tourism Office, Jefferson County generated an average of \$178 million per year in tourism-derived revenue for state and local governments over the last 10 years, more than any other county in West Virginia by at least double. Tourism benefits the businesses and economy of Ranson and Jefferson County producing \$213.7 million in individual earning, 7040 jobs, and \$842.6 million in direct spending here in 2018. We would need 40 Project Shuttles to replace the individual earnings and 59 Rockwools to replace the jobs provided by the tourism industry in Jefferson County. It is important to note that most of the money generated by tourism in Jefferson County comes from neighboring states. In this way, it is like an export: not simply recycling money, but bringing money into the state increasing its wealth. Much of the economy in Harpers Ferry is based on this tourism industry. A threat to this industry poses a threat to the economy and welfare of our community.

One of the important drivers for tourism in Harpers Ferry is the Appalachian Trail. According to the Appalachian Trail Conservancy (ATC), Harpers Ferry is the psychologic midpoint of the Trail, and hikers often plan extended stays in Jefferson County with an obvious positive impact. The ATC reports that the smokestacks and associated lights will be visible in the viewshed of 15 vistas on the Appalachian Trail (AT). Studies have shown that quality of vistas and human impact on the environment are not only noticed by visitors, but effect their experience. Another study published in the Journal of Applied Recreation Research, found that points of interests and views drew visitors' attention and had a significant impact on their perception of the trail. It was also found that particularly beautiful vistas helped visitors overlook elements

that usually have a negative effect on trail experience like increased trail traffic. A 2009 study in Leisure Sciences revealed that scenic value was a perceptual theme of Appalachian Trail visitors, and that things as simple as dead trees visible in a vista can have a negative impact on visitors' overall perception. Imagine the effect the smokestacks will have from the 15 vistas from which they will be visible. The introduction of industrial activity made possible by the proposed rezoning in Ranson would have a negative effect on the scenic views of beautiful landscapes from the Appalachian Trail in Jefferson County.

The smokestacks are not all visitors will be able to see — the air pollution will create haze. The effect of regional haze on tourists was explored in a review article published in the Atmospheric Environment titled "Impaired visibility: the air pollution people see." A key takeaway on the negative affect of haze on vacationing tourists was summarized as follows:

"Vacations offer an escape from the routine and stress of our daily lives. Vacation destinations are often chosen based on their scenery; vacations are spent gazing at monuments, mountains, clouds, and oceans. Good visibility allows clear observation of distant features and appreciation of the inherent beauty of these scenes...Air pollution, which is often present in both our cities and parks, interferes with these attributes and can ruin the views vacationers travel to enjoy."

People seek bucolic, unspoiled areas to escape the stresses of urban areas. A 2004 study in Environment and Behavior found perceived pollution causes stress while viewing natural scenes has both psychological and physiological benefits, and a 2007 study confirmed these benefits. Two other studies found that people are emotionally affected by poor visibility, and tourists are disappointed when views are obscured by haze.

The combination of smokestacks and haze will mar the viewshed and will not only reduce the positive effects of a scenic landscape but also leave tourists disappointed and dissatisfied with their choice of destination. With these effects the welfare of the Harpers Ferry community would undoubtedly be endangered by the industry that this zoning change will provide for.

Multiple studies by doctors Kozar, Doctor, and Doctor have demonstrated that the land at this site to be rezoned is Karst with the highest likelihood of sinkhole development in the county, and that the groundwater aquifer there is incredibly sensitive to contamination from surface water. Further, this site is on an upland plain with relatively few surface streams, seasonal variability in the water table that results in numerous estavelles, and large amounts of water in the epikarst. In this area contamination in surface water communicates easily to the water in the epikarst via diffuse and point infiltration, and the springs at the margins of the upland area are directly affected by the water quality throughout the aquifer. According to Jefferson Orchards Voluntary Remediation Plan with the WVDEP, the groundwater at the site is approximately 60 feet below the ground, and the tests performed by the USGS have shown that groundwater from just adjacent to this site emerged in the headwaters of both the Elk's Run and Rattlesnake Run. This is critically important for Harpers Ferry because the Elk's Run headwaters is a spring about three miles southeast of the site and goes on to become the drinking water source for Harpers Ferry and Bolivar before emptying into the Potomac River.

The headwaters of Rattlesnake Run is a spring about 3.5 miles from the site and is also a tributary of the Potomac River. The Potomac River is the back up water source for Harpers Ferry. This means that the activity at the site will have a critical influence on the drinking water of Harpers Ferry. In this was the industry permitted by this change in zoning would undoubtedly endanger the health and safety of the community in Harpers Ferry.

The untoward health effects and individual economic consequences from the pollution emissions of the industry this rezoning will allow that will be born out over the length of people's lives and that of their decedents for at least three generations is an egregious example of environmental injustice that should not be tolerated. This zoning change may be in one of the poorest sections of the county, but the effects will be felt in every part of Ranson and the county.

The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." The industry that this rezoning will allow will jeopardize the health, safety and welfare of Ranson, Harpers Ferry and the whole county. Please vote no on the ordinance #2017-302.

There are just so very many reasons to deny the rezoning. I had been so impressed with the Ranson comprehensive plan and appreciated that it was so focused on our people. I felt good about raising my family in our Jefferson County. It's not right to betray the vision in this way, taking away whole village communities, the possibility of Northpoint station, and polluting our whole region. Please do not change the zoning.

Sincerely,

Melodie J. O'Hanlon

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

bill castro

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance

#2017-302. Please keep our future and our children's future in mind. Protect our environment and our lives. We've had enough damage to nature. Please vote No.

Sincerely,

Christine Green

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

This land and this location are not appropriate for the industry this zoning change will allow. The hydrogeology of the land combined with such industrial activity risks the safety of our water supply. The air emissions from this industry will negatively impact our physical and mental health, our children's ability to achieve, our ability to make a living, our happiness, and it will do this for generations even after we leave or the pollution stops. The industry this zoning change will provide for will adversely affect the health, safety, and welfare of our community. It is not lost on us that this zoning change is being made next to our neighborhood and not next to the residents of Ranson, yet Ranson is in control. This is not right. We respectfully ask you to vote NO on ordinance #2017-302.

The land at the site in question is not just ill-suited, but completely inappropriate for the industry this zoning change will allow. This land has karst hydrogeology. As such, the ground itself is very unstable and readily develops sinkholes. This land has been described by a 2012 study to be exceptionally susceptible to sinkhole formation, more so than most of the rest of the county. Sinkholes provide point infiltration of surface water into the water in the epikarst. The porous bedrock allows diffuse infiltration of surface water into the epikarst water. At this site, there is also large amounts of water in the epikarst and it is only 60 feet from the surface. This allows the water at the surface to easily communicate with the water in the epikarst and the groundwater aquifer carrying any surface water contaminants with it.

The industrial activity this zoning change will allow for will cause ample surface water contamination from ground level industrial activities, raw material and waste storage and particulate matter falling to the ground from the air emissions. The industry that is currently planning to utilize this zoning change should be designated a stormwater hotspot just for this reason. The WVDEP should require them to treat all water before it is allowed to infiltrate the ground, but so far, this has not been done. The WVDEP actually recommends that areas like this not be developed due to the risk to groundwater. Their guiding document, Stormwater

Management Design in Karst Areas states, "it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that the best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." This guidance should be followed; clearly we cannot expect the DEP to protect us from inappropriate zoning changes. Mr. Stranko indicated that the council should not take environmental issue into consideration when zoning. However, it is clear that the DEP is imploring local governments to take the hydrogeology and in particular karst into consideration when zoning.

The wellhead protection area for the Fox Glen's well and that of the elementary school where our children go to school intersects with the land where the zoning change is being proposed. However, a USGS study has shown that the groundwater aquifer here moves relatively fast and so contamination throughout this property is a concern for our water quality. This zoning change will clearly endanger the safety of our water supply. If the well at Fox Glen is contaminated and the utility is forced to divert water from further away, this may be used as evidence at the Public Service Commission to raise the water tariff on Fox Glen residents. This is an increase many will not be able to afford, raising the risk of water insecurity. Through this effect on the water supply the industry this zoning change will provide for will adversely affect the safety and welfare of our community.

The air emissions that will be produced by the industry that this zoning will allow include gaseous (SO₂, NO₂, O₃ (VOC and NO_x)), particulate matter (PM₁₀, PM_{2.5}, PM_{0.1}), and hazardous emissions (neurotoxins and carcinogens). We will be exposed through our lungs from the air we breathe, through our skin from the air and things we contact, and through contaminated things we may ingest. Our kids will be more exposed because they spend more time playing outside and on the ground and kids like to put things in their mouth. In fact, according to the National Academy of Science, our kids are more at risk because they breathe more air per pound than adults, their detoxification pathways are less mature, they are growing and developing and these processes are more sensitive, and they have more years to live yet and thus more years to develop slow onset diseases. Exposure to air pollution in early human development, especially exposure to fine particulate pollution, can be extremely deleterious to children's health and development.

The negative effects start in utero. Embryonic and fetal cells are exquisitely sensitive and are affected directly by inhaled pollutants that across the placenta like fine particulate matter as well as other secondary pathways causing impaired organ development, disturbed development of the immune system, premature birth, lower birth weight, and increased infant mortality. These early changes lead to long-term effects including increased disease development in multiple organ systems throughout life, cognitive defects, achievement deficits, and negative psychological social and economic effects.

Fetal and early life exposure to air pollution causes inappropriate brain growth and maturation in early life, neurodevelopmental disorders, early cognitive deficits, and has been associated

with autism by several case-control studies. Several studies have demonstrated a scholastic deficit in exposed children for almost all subject matter and at a variety of grade levels. The cause of these findings are multifactorial and researchers suggested they include exacerbation of asthma symptoms, other decreased health parameters, increased fatigue, increased absence, or a direct neurodegenerative effect, all caused by or contributed to by the exposure to air pollution.

Development of the respiratory system starts in utero, is 80% complete by age 6, and continues to early 20s. A review by Korten et. al. in 2017 explained that exposure to air pollution during the first 6 years of life can damage the lung tissue, impair lung growth, and alter the development of immune function and repair mechanisms within the lungs. These effects increase both short- and long-term risk for asthma, chronic obstructive pulmonary disease (COPD), lung cancer, and respiratory infections. Exposure to outdoor air pollution not only increased the risk of these diseases, but exacerbates existing disease increasing severity of symptoms, hospital visits, and death due to these diseases. A 2019 study found “even within the limits set by the World Health Organization, the pollutants PM10, SO2, NO2, and O3 are associated with increased risk of treatment for respiratory diseases in children 0 to 6 years of age.” It is important to note that the US limits are set higher than the WHO, 300% higher in the case of PM10!

There are a multitude of other physiologic effects of air pollution that cause increased rates of morbidity and mortality in both adults and children. Air pollutants are associated with increased risk of autoimmune diseases like asthma, allergies, and eczema. Air pollution has deleterious effects on the cardiovascular system, endocrine system and blood, contributing to the occurrence of high blood pressure, high cholesterol, obesity, anemia, and stroke.

There are psychological effects as well. A review, of 178 published articles by Lu published in 2020, systematically examined the psychological (affective, cognitive, behavioral), economic, and social effects of air pollution and found: “Affectively, air pollution decreases happiness and life satisfaction, and increases annoyance, anxiety, mental disorders, self-harm, and suicide. Cognitively, it impairs cognitive functioning and decision making. Behaviorally, air pollution triggers avoidance behavior, defensive expenditure, and migration as coping strategies. Economically, it hurts work productivity and stock markets. Socially, it exacerbates criminal activities and worsens perception of the government. Importantly, both actual and perceived air pollution levels matter.”

Through negative physical and mental health effects air pollution has been shown to decrease an individual’s productivity and ability to participate in the workforce, negatively impacting workforce availability and overall productivity. This negatively impacts individual workers, companies, and the local economy. It also decreases individual’s ability to relocate themselves or their family into an area less affected by pollution. In this way a vicious cycle is set up where successive generations are exposed to the same pollutants and experience the negative effects of the ongoing exposure to pollution. This is not a fate the children of Fox Glen deserve to have thrust upon them by this zoning change and the industry that it will allow into our bucolic

county. An editorial in the New England Journal of Medicine, commenting on several recent studies, stated: "The best control strategy from the standpoint of human health, supported by the scientific evidence to date, is to reduce the levels of all types of air pollutants. Our children's health depends on it." Clearly the industry that this zoning change will provide for will negatively effect the health, safety, and welfare of our community.

The area surrounding the location, of the proposed zoning change that will accommodate heavier types of industry, is historically lower income and underserved. Deciding to locate a tract of such zoning in this location when is it on the whole unwanted and totally inappropriate for the land and surroundings is an example of environmental injustice. The Lancet Commission on Pollution and Health, citing the United Nation's Universal Declaration of 1948 on Human Rights, found that "pollution threatens fundamental human rights - the right to life, the right to health, the right to well-being, and the rights of the child." This rezoning represents not only a bygone era of economic development but a bygone era of environmental injustice and human rights violation.

The Lancet Commission on Pollution and Health further found that prevention of non-communicable diseases will require pollution prevention and that this will require fundamental changes in societal patterns of production, consumption, and transportation. This will require a paradigm shift to a more sustainable economic model based on recognition of human rights. They also found this is a major unexploited opportunity in society that many communities are grappling with undertaking. The movement away from the smart code zoning, with it integrated walkable communities, to large tracts of land dedicated to polluting industry close to a title one school is the exact opposite of this. This rezoning would represent a major step in the wrong direction for disease prevention, human rights, Ranson, and Jefferson County!

As a professional who works with children with disabilities, I can tell you that families, and in fact the coffers of Jefferson County and WV don't need to add any more children with disabilities brought on by poorly planned industry location. The traumatic effects on families and communities as well as the healthcare costs over a lifetime are in no way worth a foreign company's profits.

I for one was horrified to see Governor Jim Justice, who has been very influential in bringing this polluting industry to Jefferson County, come to Shepherdstown to speak to constituents and claim how much he loved children. I couldn't help but think the entire time, if he claims to love children so much, why was he so willing to poison those in Fox Glen and those who attend NJES, a Title 1 school, along with 30% of the rest of the student body of Jefferson County. This change in zoning is not appropriate for this land and this area. This land itself is not well suited for the industry this zoning change would allow. This industry would severely adversely affect the health, safety and welfare of our community. Please vote NO on the Ordinance #2017-302.

Sincerely,

Sharon Helman

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask that you vote no on Ordinance #2017-302. While not in Ranson, the land and homes around the property that is the subject of the zoning change are closer to the property than anyone who currently lives within the city limits of Ranson. This area will be affected sooner and more harshly by the environmental issues that will develop secondary to the inappropriate siting of industry this zoning would allow.

The subject land has been well studied by Drs. Kozar, Doctor and Doctor and described in the scientific literature and USGS reports as having karst hydrology with very high aquifer vulnerability. The karst landscape is a consequence of the presence of soluble bedrock, which consists of limestone in the case of the subject land. In such landscapes water percolates through the ground and dissolves the underlying rock creating a porous network of caverns and throughways. Karst aquifers are known to be "extremely vulnerable to pollution" due to direct connection between the surface water and groundwater through both point (sinkholes) and diffuse (everywhere) infiltration. It is known from the Voluntary Remediation Plan of Jefferson Orchard that the groundwater at the subject site is only 60 feet below the ground. The subject property and much of the property around it are on an upland plain with few surface streams, but great seasonal variability in the water table resulting in numerous esteves and large amounts of water in the epikarst. This water is easily contaminated and this contamination spreads quickly throughout the aquifer. Dye tests performed near the subject site by the USGS have demonstrated this quick moving thorough dispersment in the aquifer in this area. While this contamination goes on to affect springs at the margins of the upland area continuing on in streams that service municipal water sources and the Potomac River, our concerns are far more immediate in both time and distance. Well water is the only water source available in the area of the proposed zoning change and, with the exception of Fox Glen, a majority of this water is supplied by private wells. Therefore, the groundwater aquifer fulfills a critical necessity, fulfilling all needs including human consumption, household uses, and agriculture and

maintenance of livestock and horses in the immediate area around the site. The concern is that if the aquifer becomes contaminated, then the local drinking water will be fouled.

For decades now, policy makers have been using “Aquifer Vulnerability,” to set land use and water resource protection policy. Karst has very high Aquifer Vulnerability. Therefore, this industrial use is not appropriate for this land and it should not be zoned for it. The guiding documents of the WVDEP recognize this. The introduction to the WVDEP document Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.”

The Chesapeake Bay Stormwater Network karst stormwater guidance document the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed, which the WVDEP cites in its own guiding document Stormwater Management Design in Karst Areas, clearly agrees stating:

“First, the effect of land development on karst terrain is complex and hard to predict, and requires professional analysis to reduce the risk of geological hazards, damage to infrastructure and groundwater contamination.” “The working group acknowledges that past approaches to stormwater and land development in karst terrain have been inadequate to safeguard the public and the environment.” “...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” We clearly need stronger comprehensive land use plans and zoning that direct new growth away from karst areas to more appropriate locations. Ordinance #2017-302 is literally the opposite of this.

Further, we cannot rely on the WVDEP to do the job that good local land use guidelines and zoning should do. For example, the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed states that detention and retention ponds are not recommended on karst and categorize them as discouraged. Also, quoting WVDEP’s own karst guidance: “attenuating surface runoff will increase the rate of sinkhole formation and potential groundwater contamination.” Yet the entity currently planning to utilize this zoning change is planning employment of multiple massive retention ponds and attenuating surface runoff completely. This has already been approved by the DEP in two Construction Stormwater General Permit registrations for that company. One of detention ponds is not even regulated by the DEP as it contains process water and has no outlet. Clearly the DEP recognizes the risks but is not appropriately limiting them. Relying on the DEP to protect the public health, safety, welfare, and the environment from any entity in these karst locations is simply as the CNS bulletin said it “inadequate to safeguard the public and the environment.” We must have appropriate zoning that takes into consideration appropriate use of land with karst hydrogeology. Ordinance #2017-302 does not do this, but instead increases the risk to the public and the environment.

A second serious concern is the air emissions from the industry that this zoning will provide for. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. These types of air emissions have been shown to increase the risk of, contribute to, and exacerbate a multitude of developmental, physical, physiological, physiological, cognitive and economic. The exposure of one individual can cause repercussions in multiple generations. Embryos, fetuses, and children are most vulnerable with effects born out over a lifetime, and that of their offspring. Many of these effects only require short-term exposure and some have even been shown to occur at levels below current limits recommended by the World Health Organization. One example of this is that a recent study found that “Even within the limits set by the World Health Organization, the pollutants PM₁₀, SO₂, NO₂, and O₃ are associated with increased risk of treatment for respiratory diseases in children 0 to 6 years of age.” Unfortunately, the US limits are higher than WHO, 300 % higher in the case of PM₁₀!

In fact, in 2019, in the Advice from the Independent Particulate Matter Review Panel (formerly U.S. EPA Clean Air Scientific Advisory Committee Particulate Matter Review Panel) on EPA’s Policy Assessment for the Review of the National Ambient Air Quality Standards for Particulate Matter, it stated that the committee unanimously and unequivocally found that the current primary annual and 24-hour PM_{2.5} National Ambient Air Quality Standards (NAAQS) are not adequate to protect public health. The advice from this 20-member committee, whose scientific disciplines include epidemiology, medicine, toxicology, air quality measurement, air quality modeling, exposure assessment measurement and modeling, risk assessment, statistics, and others, was ignored due presumably to political pressure. Not only are the NAAQS too high in some cases, but due to the measure and mechanism by which they work, they can not replace the safety provided by good land use and zoning regulations, that are meant to do things like keep factories with air emissions and hundreds of heavy trucks away from elementary schools. In fact, there is a state law that prohibits siting a school near a factory. Unfortunately, the reciprocal law does not exist. Clearly, just like with the water resources, we cannot rely on the DEP or the EPA to do the job of what appropriate zoning should do. The whole point of zoning is to keep people safe and provide for their health and welfare. Ordinance #2017-302 puts families and school children directly in harms way.

The air emissions, threat to the groundwater, and the very presence of the industry that this zoning change will allow for will have a serious negative economic effect on those who live and or work closest to the site in question. Productivity and workforce participation will be negatively affected by the health effects of the air emissions. The local agricultural operations will be negatively affected by the air emissions with lower quantity and quality of crop yield and would be devastated if the ground water aquifer were fouled. The equine operations in the area, of which there are several, will be negatively affected by the air emissions as they affect the horses’ health and performance. The mere presence of the industry that will be provided for by this zoning change will cause property values to fall. There will be serious economic consequences for the immediate area around the site in question.

Several of the communities in the immediate area of the site for proposed zoning change are traditionally underserved and have lower economic status. The choice of this location for such a zoning change represents an egregious example of environmental injustice that should not be promulgated or tolerated.

This zoning change will provide for industry that will negatively affect the health safety and welfare of our community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Edy Cummings

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask that you vote no on Ordinance #2017-302. While not in Ranson, the land and homes around the property that is the subject of the zoning change are closer to the property than anyone who currently lives within the city limits of Ranson. This area will be affected sooner and more harshly by the environmental issues that will develop secondary to the inappropriate siting of industry this zoning would allow.

The subject land has been well studied by Drs. Kozar, Doctor and Doctor and described in the scientific literature and USGS reports as having karst hydrology with very high aquifer vulnerability. The karst landscape is a consequence of the presence of soluble bedrock, which consists of limestone in the case of the subject land. In such landscapes water percolates through the ground and dissolves the underlying rock creating a porous network of caverns and throughways. Karst aquifers are known to be "extremely vulnerable to pollution" due to direct connection between the surface water and groundwater through both point (sinkholes) and diffuse (everywhere) infiltration. It is known from the Voluntary Remediation Plan of Jefferson Orchard that the groundwater at the subject site is only 60 feet below the ground. The subject property and much of the property around it are on an upland plain with few surface streams, but great seasonal variability in the water table resulting in numerous esteves and large amounts of water in the epikarst. This water is easily contaminated and this contamination spreads quickly throughout the aquifer. Dye tests performed near the subject site by the USGS have demonstrated this quick moving thorough dispersment in the aquifer in this area. While this contamination goes on to affect springs at the margins of the upland area continuing on in streams that service municipal water sources and the Potomac River, our concerns are far more immediate in both time and distance. Well water is the only water source available in the area of the proposed zoning change and, with the exception of Fox Glen, a majority of this water is supplied by private wells. Therefore, the groundwater aquifer fulfills a critical necessity, fulfilling all needs including human consumption, household uses, and agriculture and

maintenance of livestock and horses in the immediate area around the site. The concern is that if the aquifer becomes contaminated, then the local drinking water will be fouled.

For decades now, policy makers have been using “Aquifer Vulnerability,” to set land use and water resource protection policy. Karst has very high Aquifer Vulnerability. Therefore, this industrial use is not appropriate for this land and it should not be zoned for it. The guiding documents of the WVDEP recognize this. The introduction to the WVDEP document Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.”

The Chesapeake Bay Stormwater Network karst stormwater guidance document the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed, which the WVDEP cites in its own guiding document Stormwater Management Design in Karst Areas, clearly agrees stating:

“First, the effect of land development on karst terrain is complex and hard to predict, and requires professional analysis to reduce the risk of geological hazards, damage to infrastructure and groundwater contamination.” “The working group acknowledges that past approaches to stormwater and land development in karst terrain have been inadequate to safeguard the public and the environment.” “...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” We clearly need stronger comprehensive land use plans and zoning that direct new growth away from karst areas to more appropriate locations. Ordinance #2017-302 is literally the opposite of this.

Further, we cannot rely on the WVDEP to do the job that good local land use guidelines and zoning should do. For example, the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed states that detention and retention ponds are not recommended on karst and categorize them as discouraged. Also, quoting WVDEP’s own karst guidance: “attenuating surface runoff will increase the rate of sinkhole formation and potential groundwater contamination.” Yet the entity currently planning to utilize this zoning change is planning employment of multiple massive retention ponds and attenuating surface runoff completely. This has already been approved by the DEP in two Construction Stormwater General Permit registrations for that company. One of detention ponds is not even regulated by the DEP as it contains process water and has no outlet. Clearly the DEP recognizes the risks but is not appropriately limiting them. Relying on the DEP to protect the public health, safety, welfare, and the environment from any entity in these karst locations is simply as the CNS bulletin said it “inadequate to safeguard the public and the environment.” We must have appropriate zoning that takes into consideration appropriate use of land with karst hydrogeology. Ordinance #2017-302 does not do this, but instead increases the risk to the public and the environment.

A second serious concern is the air emissions from the industry that this zoning will provide for. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. These types of air emissions have been shown to increase the risk of, contribute to, and exacerbate a multitude of developmental, physical, physiological, physiological, cognitive and economic. The exposure of one individual can cause repercussions in multiple generations. Embryos, fetuses, and children are most vulnerable with effects born out over a lifetime, and that of their offspring. Many of these effects only require short-term exposure and some have even been shown to occur at levels below current limits recommended by the World Health Organization. One example of this is that a recent study found that “Even within the limits set by the World Health Organization, the pollutants PM₁₀, SO₂, NO₂, and O₃ are associated with increased risk of treatment for respiratory diseases in children 0 to 6 years of age.” Unfortunately, the US limits are higher than WHO, 300 % higher in the case of PM₁₀!

In fact, in 2019, in the Advice from the Independent Particulate Matter Review Panel (formerly U.S. EPA Clean Air Scientific Advisory Committee Particulate Matter Review Panel) on EPA’s Policy Assessment for the Review of the National Ambient Air Quality Standards for Particulate Matter, it stated that the committee unanimously and unequivocally found that the current primary annual and 24-hour PM_{2.5} National Ambient Air Quality Standards (NAAQS) are not adequate to protect public health. The advice from this 20-member committee, whose scientific disciplines include epidemiology, medicine, toxicology, air quality measurement, air quality modeling, exposure assessment measurement and modeling, risk assessment, statistics, and others, was ignored due presumably to political pressure. Not only are the NAAQS too high in some cases, but due to the measure and mechanism by which they work, they can not replace the safety provided by good land use and zoning regulations, that are meant to do things like keep factories with air emissions and hundreds of heavy trucks away from elementary schools. In fact, there is a state law that prohibits siting a school near a factory. Unfortunately, the reciprocal law does not exist. Clearly, just like with the water resources, we cannot rely on the DEP or the EPA to do the job of what appropriate zoning should do. The whole point of zoning is to keep people safe and provide for their health and welfare. Ordinance #2017-302 puts families and school children directly in harms way.

The air emissions, threat to the groundwater, and the very presence of the industry that this zoning change will allow for will have a serious negative economic effect on those who live and or work closest to the site in question. Productivity and workforce participation will be negatively affected by the health effects of the air emissions. The local agricultural operations will be negatively affected by the air emissions with lower quantity and quality of crop yield and would be devastated if the ground water aquifer were fouled. The equine operations in the area, of which there are several, will be negatively affected by the air emissions as they affect the horses’ health and performance. The mere presence of the industry that will be provided for by this zoning change will cause property values to fall. There will be serious economic consequences for the immediate area around the site in question.

Several of the communities in the immediate area of the site for proposed zoning change are traditionally underserved and have lower economic status. The choice of this location for such a zoning change represents an egregious example of environmental injustice that should not be promulgated or tolerated.

This zoning change will provide for industry that will negatively affect the health safety and welfare of our community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Miriam Rakes

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Paul Young

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on Ordinance #2017-302. Ranson's proposed zoning change presents a significant risk to the equine industry in Jefferson County and well beyond. The type of industry that would be allowed by the proposed zoning change in this location would jeopardize horse health, the groundwater supply, and workforce productivity. This will cause immediate shrinkage and threaten the long-term viability of the equine industry in the county. In doing so, the industry this zoning change will allow for will adversely affect the health, safety, and welfare of our community.

I am the more than 10th generation of my family to live here in the valley. I and much of my family have worked in the Equine industry my entire life. It is simply not right to change the zoning to bring in a company like this in the way it was done. Right the wrong. The equine industry and the equine people do so much for this town and this county they do not deserve this.

The site of the proposed rezoning is less than six miles from Charles Town Races, with several breeding, training, and rehabilitation facilities between the two. The industry allowed by this rezoning would produce particulate, gaseous, and hazardous air emissions that would reach these sites. According to the WVDEP air permit, the Rockwool plant in Ranson is permitted to emit 250.87 tons of particulate matter per year into the air (1).

According to a recent study published in the journal of Veterinary Internal Medicine (2), horses are 15 times more sensitive to inhaled particulate matter than humans. Inhaled particulate matter can cause inflammation in horses' lungs that negatively affects performance. Inhaled particulate matter also contributes to the development of inflammatory airway disease (IAD) (3). IAD is a chronic airway disease that can affect horses long after their racing career is over. While there is little research on how other air pollutants affect horses, the effects of pollution on humans can be used to infer potential impact on horses. However unlike human models,

these horses are elite athletes continuously exposed, and will thus likely experience detrimental effects at much lower levels of air pollution than humans.

The primary concern with air pollution is that increased levels of pollutants will increase inflammation in horses' lungs. Even small, subclinical amounts of inflammation in the lungs of horses negatively affect performance (2,3,4,5,6,11). This inflammation can also cause increased recovery times following racing (7,11). Reduced performance and training interruptions can lead to higher risk of injury, reduced winning average, fewer yearly starts, lower yearly earnings, shortened career length, fewer lifetime starts, reduced lifetime earnings, and reduced quality of life (2,3,8,9,11). Each of these situations will lead to decreased return on investment, decreased cash flow, and decreased overall earnings for owners, trainers, and breeders with horses at Charles Town Races and in nearby areas. In this way, the industry this zoning will allow will adversely affect the welfare of our community.

While racing is usually a thoroughbred's first career, it is rarely their last. Some racing horses go on to be breeding stock, while others will have successful careers as sport horses. Jefferson County is an important source of new stock for sport horse trainers from Northern Virginia, and Maryland, and this is a resource for local horseman of both income and placement for horses not appropriate for breeding. However, if retired racehorses are unsound from injury or respiratory disease, they can be difficult to manage as breeding stock or unfit for a career as a sport horse. This affects the horse's quality of life and also places a burden on the industry locally and regionally. In this way, the industry this zoning will provide for will adversely affect the welfare of our community.

The perception of decreased air quality from the increase in regional haze and visible smokestacks as one drives into the county will deter out of state owners and breeders from investing in West Virginia bred Race horses, decreasing or eliminating a critical \$50 million a year source of local business volume. In this way, the industry this zoning will provide for will adversely affect the welfare of our community.

Another concern related to the proposed rezoning in Ranson is the risk of groundwater contamination as a result of the karst hydrogeology at the site and the industrial activity. Horsemen will either have to take on the expense of periodically testing water sources or they may not know local ground water is contaminated until their animals are sick. Veterinary care and testing adds expense and uncertainty to an industry that already deals with large inherent risks. The actual occurrence of ground water contamination would be devastating for Jefferson County's equine industry. For both geographic and financial reasons, it is simply impossible to think that the industry could solely use public or private utility-provided water if industrial activity fouled the local groundwater. In this way, the industry this zoning will provide for will adversely affect the health, safety, and welfare of our community.

Finally, studies on US agricultural workers have demonstrated that increased air pollution decreases productivity of outdoors workers. This would place an additional burden on workers,

small business owners and the industry. In this way the industry this zoning will provide for will adversely affect the health, safety, and welfare of our community.

The equine industry in Jefferson County is hundreds of years old. It is not worth risking this historic and economically valuable industry by rezoning for industrial companies like Rockwool. An economic impact study of the Charles Town Thoroughbred Horse Racing Industry on Jefferson County's economy found that the spending by owners, breeders, and trainers of the equine industry directly contributes \$79.4 million to the county each year. Out-of-state owners, breeders, and trainers spend more than \$50 million in Jefferson County every year. The value of total business volume in Jefferson County is \$191 million each year (10). These numbers do not include the effect of the handle or the casino.

The equine industry provides jobs for a broad cross-section of the public. This industry offers individuals of any educational background a variety of paths to achieve a good middle-income living. Many jobs allow individuals to pursue apprenticeships or on-the-job training rather than requiring a costly college education. This flexibility allows for greater lifetime earnings and improved educational debt-to-earnings ratio for these workers. The equine industry also provides opportunities for non-traditional workers by offering job opportunities to those who may not be employable by larger corporations. This industry provides a variety of full-time, part-time, flexible, and pick-up work. Encouraging this type of flexible job ecosystem helps create a healthy economy with broad participation in employment and consumption.

The equine industry is a large conglomerate of small businesses, which have a multitude of economic benefits over having a few large businesses. It has been extensively reported that small locally owned businesses and start ups create more jobs, cultivate innovation, generate higher incomes, and provide more opportunities for individuals that would otherwise not exist than big non-local firms, which can actually depress local economies. The equine industry provides opportunities for small businesses and startups responsible for this growth of better jobs that are so good for the economy.

The equine industry offers so many other benefits that the industry in the rezoned area would not. For example, the equine industry supports local agriculture by providing a market for agricultural goods such as straw. The robust straw market supported by owners, trainers, and breeders allows for a third cash crop to be produced from one field in a year. Through pastureland and support of local agricultural goods, the equine industry protects and preserves the open spaces that give our county its bucolic quality and help attract tourists. Through the breeders' incentive programs, the equine industry offers unique opportunities to draft state funds back to Jefferson County, to name a few.

Rezoning this area of Ranson for Special District Industrial will allow in entities whose activities are harmful to the equine industry. The losses incurred by the equine industry would far outweigh any benefits derived from industries occupying the rezoned area. Sacrificing the long-term viability of one of our oldest and most productive industries for a net loss in business volume and economic value just does not make good sense for the local economy. This zoning

change would provide for industry that would adversely affect the health, safety and welfare of our communities. Please vote NO on Ordinance #2017-302

Sincerely,

Elizabeth Meehan

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Jim Reid

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Listening to the video of the Jan. 5, 2020, meeting, I was struck by the comments of experts speaking to data and statistics used for establishing emissions at the Rockwool factory, of INCOMPARABLE measurements -- that is, comparing what emissions would be here in Jefferson County based on areas (as I recall, in Pennsylvania) that were not in fact comparable at all to conditions here in the Ranson area of West Virginia. If data are not based on true comparables, then the data obviously are not relevant.

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects

have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, "the City will designate ample land that is well-suited for industrial facilities." Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, "it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would negatively affect tourism, economic agility, groundwater quality, and individual health in neighboring municipalities like Shepherdstown. In doing these things the industry that this zoning change provides for will adversely affect the health, safety, and welfare of our community.

Tourism is critically important to Shepherdstown's economy and to the county as a whole. In 2018, tourist spending in the Jefferson County contributed over \$170 million to state and local government revenue and \$213 million in individual earnings. Importantly, most of this money comes from tourists visiting from neighboring states like Virginia, Maryland, and Washington D.C. Out-of-state tourists are largely drawn to Jefferson County because of its reputation for environmental-friendly, sustainable industry. Key elements that support this reputation include the county's pastoral scenery and pristine natural resources. Ordinance #2017-302 will allow industry into Jefferson County that risks harming these elements and dramatically reducing the area's appeal to visitors. The resulting harm to our tourist industry would drive away visitors and decrease state, county, and local revenue. The long-term success of Jefferson County's tourism industry is dependent on local governments making coordinated zoning decisions. Allowing certain types in industry in Ranson will negatively affect tourism in every municipality throughout the county, including Shepherdstown. Voting no on ordinance #2017-302 will protect the foundations of the county's tourism industry and protect the 7,040 jobs in Jefferson County that are directly supported by tourism. In this way the industry this zoning change will allow will adversely affect the welfare of our community.

The type of large, consolidated industry that ordinance #2017-302 would allow in Ranson would generally reduce the flexibility of local economies in Jefferson County. Historically, the driving industries in Jefferson County have been tourism, agriculture, and the equine industries. These three industries are large conglomerates of small businesses. Small business is very important

to Shepherdstown. Small businesses have been shown to create more jobs, cultivate more innovation, and provide more opportunities than big, non-local firms. Additionally, small businesses have been shown to be more reactive to sudden changes relative to manufacturing businesses. Bringing large, manufacturing-based industry into Jefferson county will depress the local economy and stifle innovation. During this time of economic upheaval and uncertainty, Jefferson County needs to support industries that will allow local economies to adapt and recover as fast as possible.

Finally, good environmental quality is the basis for keeping our residents healthy and capable of working and learning. Children who are growing up here have had the benefit of robust outdoor play, and residents and their families have prized the outdoor recreation possible in a clean environment, such as fishing, boating, hiking, gardening, and even attending the racetrack.

Voting no on ordinance #2017-302 will help protect water resources throughout Jefferson County. The type of industry that ordinance #2017-302 would allow puts the ground resources of Jefferson county at significant risk due to the karst hydrogeology. The site in Ranson is in the Rocky Marsh Run watershed, which is in the source water protection zone for Shepherdstown and drains to the Potomac River. Therefore, activity at this site will affect both groundwater and surface water streams. In municipalities like Shepherdstown, many residents and nearby farms depend on wells for water. Contamination of groundwater aquifers would create both health and remediation concerns for local residents. Dye tests performed by the USGS near the area of proposed rezoning in Ranson have shown just how far-reaching groundwater contamination at the Ranson site could be. Results from the USGS study revealed measurable dye concentrations in Elk's Run, Rattlesnake Run, and even the Shepherdstown Town Run. This last run cuts through the center of Shepherdstown and is a favorite area for children to play and learn to fish. In this way, the industry that this zoning change will allow will adversely affect the safety of our community.

Groundwater pollution is not the only concern for communities like Shepherdstown. The type of industry that ordinance #2017-302 would allow in Ranson would also generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. These pollutants are particularly harmful to children. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. The site in Ranson is across the road from an elementary school and also within the Jefferson High Middle district. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of children in Shepherdstown and all of Jefferson County. In this way, the industry that this zoning change will provide for will adversely affect the health of our community.

I again request that you vote no on ordinance #2017-302. This zoning change will allow industry that will adversely affect the health, safety, and welfare of our community. The long-term economic, environmental, and community health of municipalities like Shepherdstown depend on Ranson's participation in a coordinated zoning plan for all of Jefferson County.

Sincerely,

Catherine Falknor

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Listening to the video of the Jan. 5, 2020, meeting, I was struck by the comments of experts speaking to data and statistics used for establishing emissions at the Rockwool factory, of INCOMPARABLE measurements -- that is, comparing what emissions would be here in Jefferson County based on areas (as I recall, in Pennsylvania) that were not in fact comparable at all to conditions here in the Ranson area of West Virginia. If data are not based on true comparables, then the data obviously are not relevant.

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects

have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, "the City will designate ample land that is well-suited for industrial facilities." Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, "it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Adele Fischman

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on Ordinance #2017-302. Ranson's proposed zoning change presents a significant risk to the equine industry in Jefferson County and well beyond. The type of industry that would be allowed by the proposed zoning change in this location would jeopardize horse health, the groundwater supply, and workforce productivity. This will cause immediate shrinkage and threaten the long-term viability of the equine industry in the county. In doing so, the industry this zoning change will allow for will adversely affect the health, safety, and welfare of our community.

I own a small business and nearly my whole family works in the equine industry. It is not worth changing the zoning for this one company that is going to do so much harm. This zoning changing is not aligned with the strategic plan of Ranson. Right the wrong.

The site of the proposed rezoning is less than six miles from Charles Town Races, with several breeding, training, and rehabilitation facilities between the two. The industry allowed by this rezoning would produce particulate, gaseous, and hazardous air emissions that would reach these sites. According to the WVDEP air permit, the Rockwool plant in Ranson is permitted to emit 250.87 tons of particulate matter per year into the air (1).

According to a recent study published in the journal of Veterinary Internal Medicine (2), horses are 15 times more sensitive to inhaled particulate matter than humans. Inhaled particulate matter can cause inflammation in horses' lungs that negatively affects performance. Inhaled particulate matter also contributes to the development of inflammatory airway disease (IAD) (3). IAD is a chronic airway disease that can affect horses long after their racing career is over. While there is little research on how other air pollutants affect horses, the effects of pollution on humans can be used to infer potential impact on horses. However unlike human models, these horses are elite athletes continuously exposed, and will thus likely experience detrimental effects at much lower levels of air pollution than humans.

The primary concern with air pollution is that increased levels of pollutants will increase inflammation in horses' lungs. Even small, subclinical amounts of inflammation in the lungs of horses negatively affect performance (2,3,4,5,6,11). This inflammation can also cause increased recovery times following racing (7,11). Reduced performance and training interruptions can lead to higher risk of injury, reduced winning average, fewer yearly starts, lower yearly earnings, shortened career length, fewer lifetime starts, reduced lifetime earnings, and reduced quality of life (2,3,8,9,11). Each of these situations will lead to decreased return on investment, decreased cash flow, and decreased overall earnings for owners, trainers, and breeders with horses at Charles Town Races and in nearby areas. In this way, the industry this zoning will allow will adversely affect the welfare of our community.

While racing is usually a thoroughbred's first career, it is rarely their last. Some racing horses go on to be breeding stock, while others will have successful careers as sport horses. Jefferson County is an important source of new stock for sport horse trainers from Northern Virginia, and Maryland, and this is a resource for local horseman of both income and placement for horses not appropriate for breeding. However, if retired racehorses are unsound from injury or respiratory disease, they can be difficult to manage as breeding stock or unfit for a career as a sport horse. This affects the horse's quality of life and also places a burden on the industry locally and regionally. In this way, the industry this zoning will provide for will adversely affect the welfare of our community.

The perception of decreased air quality from the increase in regional haze and visible smokestacks as one drives into the county will deter out of state owners and breeders from investing in West Virginia bred Race horses, decreasing or eliminating a critical \$50 million a year source of local business volume. In this way, the industry this zoning will provide for will adversely affect the welfare of our community.

Another concern related to the proposed rezoning in Ranson is the risk of groundwater contamination as a result of the karst hydrogeology at the site and the industrial activity. Horsemen will either have to take on the expense of periodically testing water sources or they may not know local ground water is contaminated until their animals are sick. Veterinary care and testing adds expense and uncertainty to an industry that already deals with large inherent risks. The actual occurrence of ground water contamination would be devastating for Jefferson County's equine industry. For both geographic and financial reasons, it is simply impossible to think that the industry could solely use public or private utility-provided water if industrial activity fouled the local groundwater. In this way, the industry this zoning will provide for will adversely affect the health, safety, and welfare of our community.

Finally, studies on US agricultural workers have demonstrated that increased air pollution decreases productivity of outdoors workers. This would place an additional burden on workers, small business owners and the industry. In this way the industry this zoning will provide for will adversely affect the health, safety, and welfare of our community.

The equine industry in Jefferson County is hundreds of years old. It is not worth risking this historic and economically valuable industry by rezoning for industrial companies like Rockwool. An economic impact study of the Charles Town Thoroughbred Horse Racing Industry on Jefferson County's economy found that the spending by owners, breeders, and trainers of the equine industry directly contributes \$79.4 million to the county each year. Out-of-state owners, breeders, and trainers spend more than \$50 million in Jefferson County every year. The value of total business volume in Jefferson County is \$191 million each year (10). These numbers do not include the effect of the handle or the casino.

The equine industry provides jobs for a broad cross-section of the public. This industry offers individuals of any educational background a variety of paths to achieve a good middle-income living. Many jobs allow individuals to pursue apprenticeships or on-the-job training rather than requiring a costly college education. This flexibility allows for greater lifetime earnings and improved educational debt-to-earnings ratio for these workers. The equine industry also provides opportunities for non-traditional workers by offering job opportunities to those who may not be employable by larger corporations. This industry provides a variety of full-time, part-time, flexible, and pick-up work. Encouraging this type of flexible job ecosystem helps create a healthy economy with broad participation in employment and consumption.

The equine industry is a large conglomerate of small businesses, which have a multitude of economic benefits over having a few large businesses. It has been extensively reported that small locally owned businesses and start ups create more jobs, cultivate innovation, generate higher incomes, and provide more opportunities for individuals that would otherwise not exist than big non-local firms, which can actually depress local economies. The equine industry provides opportunities for small businesses and startups responsible for this growth of better jobs that are so good for the economy.

The equine industry offers so many other benefits that the industry in the rezoned area would not. For example, the equine industry supports local agriculture by providing a market for agricultural goods such as straw. The robust straw market supported by owners, trainers, and breeders allows for a third cash crop to be produced from one field in a year. Through pastureland and support of local agricultural goods, the equine industry protects and preserves the open spaces that give our county its bucolic quality and help attract tourists. Through the breeders' incentive programs, the equine industry offers unique opportunities to draft state funds back to Jefferson County, to name a few.

Rezoning this area of Ranson for Special District Industrial will allow in entities whose activities are harmful to the equine industry. The losses incurred by the equine industry would far outweigh any benefits derived from industries occupying the rezoned area. Sacrificing the long-term viability of one of our oldest and most productive industries for a net loss in business volume and economic value just does not make good sense for the local economy. This zoning change would provide for industry that would adversely affect the health, safety and welfare of our communities. Please vote NO on Ordinance #2017-302.

Sincerely,

James Meehan

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask that you vote no on Ordinance #2017-302. While not in Ranson, the land and homes around the property that is the subject of the zoning change are closer to the property than anyone who currently lives within the city limits of Ranson. This area will be affected sooner and more harshly by the environmental issues that will develop secondary to the inappropriate siting of industry this zoning would allow.

The subject land has been well studied by Drs. Kozar, Doctor and Doctor and described in the scientific literature and USGS reports as having karst hydrology with very high aquifer vulnerability. The karst landscape is a consequence of the presence of soluble bedrock, which consists of limestone in the case of the subject land. In such landscapes water percolates through the ground and dissolves the underlying rock creating a porous network of caverns and throughways. Karst aquifers are known to be "extremely vulnerable to pollution" due to direct connection between the surface water and groundwater through both point (sinkholes) and diffuse (everywhere) infiltration. It is known from the Voluntary Remediation Plan of Jefferson Orchard that the groundwater at the subject site is only 60 feet below the ground. The subject property and much of the property around it are on an upland plain with few surface streams, but great seasonal variability in the water table resulting in numerous esteves and large amounts of water in the epikarst. This water is easily contaminated and this contamination spreads quickly throughout the aquifer. Dye tests performed near the subject site by the USGS have demonstrated this quick moving thorough dispersment in the aquifer in this area. While this contamination goes on to affect springs at the margins of the upland area continuing on in streams that service municipal water sources and the Potomac River, our concerns are far more immediate in both time and distance. Well water is the only water source available in the area of the proposed zoning change and, with the exception of Fox Glen, a majority of this water is supplied by private wells. Therefore, the groundwater aquifer fulfills a critical necessity, fulfilling all needs including human consumption, household uses, and agriculture and

maintenance of livestock and horses in the immediate area around the site. The concern is that if the aquifer becomes contaminated, then the local drinking water will be fouled.

For decades now, policy makers have been using “Aquifer Vulnerability,” to set land use and water resource protection policy. Karst has very high Aquifer Vulnerability. Therefore, this industrial use is not appropriate for this land and it should not be zoned for it. The guiding documents of the WVDEP recognize this. The introduction to the WVDEP document Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.”

The Chesapeake Bay Stormwater Network karst stormwater guidance document the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed, which the WVDEP cites in its own guiding document Stormwater Management Design in Karst Areas, clearly agrees stating:

“First, the effect of land development on karst terrain is complex and hard to predict, and requires professional analysis to reduce the risk of geological hazards, damage to infrastructure and groundwater contamination.” “The working group acknowledges that past approaches to stormwater and land development in karst terrain have been inadequate to safeguard the public and the environment.” “...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” We clearly need stronger comprehensive land use plans and zoning that direct new growth away from karst areas to more appropriate locations. Ordinance #2017-302 is literally the opposite of this.

Further, we cannot rely on the WVDEP to do the job that good local land use guidelines and zoning should do. For example, the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed states that detention and retention ponds are not recommended on karst and categorize them as discouraged. Also, quoting WVDEP’s own karst guidance: “attenuating surface runoff will increase the rate of sinkhole formation and potential groundwater contamination.” Yet the entity currently planning to utilize this zoning change is planning employment of multiple massive retention ponds and attenuating surface runoff completely. This has already been approved by the DEP in two Construction Stormwater General Permit registrations for that company. One of detention ponds is not even regulated by the DEP as it contains process water and has no outlet. Clearly the DEP recognizes the risks but is not appropriately limiting them. Relying on the DEP to protect the public health, safety, welfare, and the environment from any entity in these karst locations is simply as the CNS bulletin said it “inadequate to safeguard the public and the environment.” We must have appropriate zoning that takes into consideration appropriate use of land with karst hydrogeology. Ordinance #2017-302 does not do this, but instead increases the risk to the public and the environment.

A second serious concern is the air emissions from the industry that this zoning will provide for. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. These types of air emissions have been shown to increase the risk of, contribute to, and exacerbate a multitude of developmental, physical, physiological, physiological, cognitive and economic. The exposure of one individual can cause repercussions in multiple generations. Embryos, fetuses, and children are most vulnerable with effects born out over a lifetime, and that of their offspring. Many of these effects only require short-term exposure and some have even been shown to occur at levels below current limits recommended by the World Health Organization. One example of this is that a recent study found that “Even within the limits set by the World Health Organization, the pollutants PM₁₀, SO₂, NO₂, and O₃ are associated with increased risk of treatment for respiratory diseases in children 0 to 6 years of age.” Unfortunately, the US limits are higher than WHO, 300 % higher in the case of PM₁₀!

In fact, in 2019, in the Advice from the Independent Particulate Matter Review Panel (formerly U.S. EPA Clean Air Scientific Advisory Committee Particulate Matter Review Panel) on EPA’s Policy Assessment for the Review of the National Ambient Air Quality Standards for Particulate Matter, it stated that the committee unanimously and unequivocally found that the current primary annual and 24-hour PM_{2.5} National Ambient Air Quality Standards (NAAQS) are not adequate to protect public health. The advice from this 20-member committee, whose scientific disciplines include epidemiology, medicine, toxicology, air quality measurement, air quality modeling, exposure assessment measurement and modeling, risk assessment, statistics, and others, was ignored due presumably to political pressure. Not only are the NAAQS too high in some cases, but due to the measure and mechanism by which they work, they can not replace the safety provided by good land use and zoning regulations, that are meant to do things like keep factories with air emissions and hundreds of heavy trucks away from elementary schools. In fact, there is a state law that prohibits siting a school near a factory. Unfortunately, the reciprocal law does not exist. Clearly, just like with the water resources, we cannot rely on the DEP or the EPA to do the job of what appropriate zoning should do. The whole point of zoning is to keep people safe and provide for their health and welfare. Ordinance #2017-302 puts families and school children directly in harms way.

The air emissions, threat to the groundwater, and the very presence of the industry that this zoning change will allow for will have a serious negative economic effect on those who live and or work closest to the site in question. Productivity and workforce participation will be negatively affected by the health effects of the air emissions. The local agricultural operations will be negatively affected by the air emissions with lower quantity and quality of crop yield and would be devastated if the ground water aquifer were fouled. The equine operations in the area, of which there are several, will be negatively affected by the air emissions as they affect the horses’ health and performance. The mere presence of the industry that will be provided for by this zoning change will cause property values to fall. There will be serious economic consequences for the immediate area around the site in question.

Several of the communities in the immediate area of the site for proposed zoning change are traditionally underserved and have lower economic status. The choice of this location for such a zoning change represents an egregious example of environmental injustice that should not be promulgated or tolerated.

This zoning change will provide for industry that will negatively affect the health safety and welfare of our community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Jessica Tuzzio

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would negatively affect tourism, economic agility, groundwater quality, and individual health in neighboring municipalities like Shepherdstown. In doing these things the industry that this zoning change provides for will adversely affect the health, safety, and welfare of our community.

Tourism is critically important to Shepherdstown's economy and to the county as a whole. In 2018, tourist spending in the Jefferson County contributed over \$170 million to state and local government revenue and \$213 million in individual earnings. Importantly, most of this money comes from tourists visiting from neighboring states like Virginia, Maryland, and Washington D.C. Out-of-state tourists are largely drawn to Jefferson County because of its reputation for environmental-friendly, sustainable industry. Key elements that support this reputation include the county's pastoral scenery and pristine natural resources. Ordinance #2017-302 will allow industry into Jefferson County that risks harming these elements and dramatically reducing the area's appeal to visitors. The resulting harm to our tourist industry would drive away visitors and decrease state, county, and local revenue. The long-term success of Jefferson County's tourism industry is dependent on local governments making coordinated zoning decisions. Allowing certain types in industry in Ranson will negatively affect tourism in every municipality throughout the county, including Shepherdstown. Voting no on ordinance #2017-302 will protect the foundations of the county's tourism industry and protect the 7,040 jobs in Jefferson County that are directly supported by tourism. In this way the industry this zoning change will allow will adversely affect the welfare of our community.

The type of large, consolidated industry that ordinance #2017-302 would allow in Ranson would generally reduce the flexibility of local economies in Jefferson County. Historically, the driving industries in Jefferson County have been tourism, agriculture, and the equine industries. These three industries are large conglomerates of small businesses. Small business is very important

to Shepherdstown. Small businesses have been shown to create more jobs, cultivate more innovation, and provide more opportunities than big, non-local firms. Additionally, small businesses have been shown to be more reactive to sudden changes relative to manufacturing businesses. Bringing large, manufacturing-based industry into Jefferson county will depress the local economy and stifle innovation. During this time of economic upheaval and uncertainty, Jefferson County needs to support industries that will allow local economies to adapt and recover as fast as possible.

Voting no on ordinance #2017-302 will help protect water resources throughout Jefferson County. The type of industry that ordinance #2017-302 would allow puts the ground resources of Jefferson county at significant risk due to the karst hydrogeology. The site in Ranson is in the Rocky Marsh Run watershed, which is in the source water protection zone for Shepherdstown and drains to the Potomac River. Therefore, activity at this site will affect both groundwater and surface water streams. In municipalities like Shepherdstown, many residents and nearby farms depend on wells for water. Contamination of groundwater aquifers would create both health and remediation concerns for local residents. Dye tests performed by the USGS near the area of proposed rezoning in Ranson have shown just how far-reaching groundwater contamination at the Ranson site could be. Results from the USGS study revealed measurable dye concentrations in Elk's Run, Rattlesnake Run, and even the Shepherdstown Town Run. This last run cuts through the center of Shepherdstown and is a favorite area for children to play and learn to fish. In this way, the industry that this zoning change will allow will adversely affect the safety of our community.

Groundwater pollution is not the only concern for communities like Shepherdstown. The type of industry that ordinance #2017-302 would allow in Ranson would also generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. These pollutants are particularly harmful to children. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. The site in Ranson is across the road from an elementary school and also within the Jefferson High Middle district. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of children in Shepherdstown and all of Jefferson County. In this way, the industry that this zoning change will provide for will adversely affect the health of our community.

I have been a proud resident of Shepherdstown and Jefferson county for nearly 50 years. We have raised our children here and would hope that they would feel comfortable raising their children here as well. I again request that you vote no on ordinance #2017-302. This zoning change will allow industry that will adversely affect the health, safety, and welfare of our community. The long-term economic, environmental, and community health of municipalities like Shepherdstown depend on Ranson's participation in a coordinated zoning plan for all of Jefferson County.

Sincerely,

Irene Yates

Shepherdstown, 25443

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would have a negative effect on water and air quality in neighboring states such as Maryland.

The Potomac River provides drinking water and a source of recreation to Maryland residents. Water and air pollution generated within the Potomac River's watershed will inevitably contaminate this valuable waterway. The site of the proposed zoning change in Ranson is located within the Potomac River Watershed.

The type of industry that ordinance #2017-302 would allow in Ranson would utilize large water impoundments, in an area of known karst terrain. This water will be contaminant from several sources including particulate mater that has fallen out from the air emissions and process water. The West Virginia Department of Environmental Protection has published guidelines that specifically discourage extensive development in areas of karst terrain because of the vulnerability of karst aquifers to contamination by surface pollution. Karst features increase surface water and groundwater connectivity and any spills or surface releases quickly percolate into the groundwater. Additionally, sinkholes are common in karst terrain and can cause ruptures in wastewater impoundments. Even if appropriate attempts are made to contain and manage wastewater and other stormwater runoff on-site, there is still a high risk that wastewater could contaminate the groundwater through tears and catastrophic failure of wastewater impoundments. Contaminated groundwater in karst terrain can easily resurface in waterways several miles away, as shown by a USGS tracer study conducted near the site in to be rezoned. The USGS study detected tracer dye in multiple springs and waterways miles from the initial injection site in Ranson. All of these waterways drain into the Potomac River.

Mismanagement of wastewater could also lead to contamination of nearby surface waters. For example, the site of the proposed rezoning in Ranson is in the Rocky Marsh Run watershed.

Rocky Marsh Run also drains to the Potomac River. Voting no on ordinance #2017-302 will preserve downstream water quality and help ensure that the Potomac River remains usable for Maryland residents.

Air pollution poses another risk to Maryland residents. The type of industry that ordinance #2017-302 would allow would generate air pollutants like fine particulate matter. According to the US EPA, fine particulates can travel 100s of miles from its original source. Air pollution related to industrial activity in Ranson could easily reach Maryland. Fine particulates have a greater affinity for carrying toxic compounds and their small size allows them to be inhaled more deeply into the lungs. Chronic exposure to fine particulate matter is associated with increased risk of several diseases including Alzheimer's in adults. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease among others. Fine particulate matter also exacerbates regional haze which creates a visible reminder of air pollution. The psychological effects that arise from an increased perception of pollution include stress, anxiety, and unhappiness. Voting no on ordinance #2017-302 will help prevent increased air pollution from negatively affecting the long-term health of Maryland residents.

The industry that this zoning will provide for will threaten the health, safety, and welfare of the residents in Maryland, and this land is not well-suited for industrial use. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." To achieve this, the council must not approve this proposed zoning change.

I again request that you vote no on ordinance #2017-302. Zoning decisions in Ranson and Jefferson County have an undeniable influence on the quality of life in neighboring states.

Sincerely,

Patricia Schooley

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask that you vote no on Ordinance #2017-302. While not in Ranson, the land and homes around the property that is the subject of the zoning change are closer to the property than anyone who currently lives within the city limits of Ranson. This area will be affected sooner and more harshly by the environmental issues that will develop secondary to the inappropriate siting of industry this zoning would allow.

The subject land has been well studied by Drs. Kozar, Doctor and Doctor and described in the scientific literature and USGS reports as having karst hydrology with very high aquifer vulnerability. The karst landscape is a consequence of the presence of soluble bedrock, which consists of limestone in the case of the subject land. In such landscapes water percolates through the ground and dissolves the underlying rock creating a porous network of caverns and throughways. Karst aquifers are known to be "extremely vulnerable to pollution" due to direct connection between the surface water and groundwater through both point (sinkholes) and diffuse (everywhere) infiltration. It is known from the Voluntary Remediation Plan of Jefferson Orchard that the groundwater at the subject site is only 60 feet below the ground. The subject property and much of the property around it are on an upland plain with few surface streams, but great seasonal variability in the water table resulting in numerous esteves and large amounts of water in the epikarst. This water is easily contaminated and this contamination spreads quickly throughout the aquifer. Dye tests performed near the subject site by the USGS have demonstrated this quick moving thorough dispersment in the aquifer in this area. While this contamination goes on to affect springs at the margins of the upland area continuing on in streams that service municipal water sources and the Potomac River, our concerns are far more immediate in both time and distance. Well water is the only water source available in the area of the proposed zoning change and, with the exception of Fox Glen, a majority of this water is supplied by private wells. Therefore, the groundwater aquifer fulfills a critical necessity, fulfilling all needs including human consumption, household uses, and agriculture and

maintenance of livestock and horses in the immediate area around the site. The concern is that if the aquifer becomes contaminated, then the local drinking water will be fouled.

For decades now, policy makers have been using “Aquifer Vulnerability,” to set land use and water resource protection policy. Karst has very high Aquifer Vulnerability. Therefore, this industrial use is not appropriate for this land and it should not be zoned for it. The guiding documents of the WVDEP recognize this. The introduction to the WVDEP document Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.”

The Chesapeake Bay Stormwater Network karst stormwater guidance document the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed, which the WVDEP cites in its own guiding document Stormwater Management Design in Karst Areas, clearly agrees stating:

“First, the effect of land development on karst terrain is complex and hard to predict, and requires professional analysis to reduce the risk of geological hazards, damage to infrastructure and groundwater contamination.” “The working group acknowledges that past approaches to stormwater and land development in karst terrain have been inadequate to safeguard the public and the environment.” “...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” We clearly need stronger comprehensive land use plans and zoning that direct new growth away from karst areas to more appropriate locations. Ordinance #2017-302 is literally the opposite of this.

Further, we cannot rely on the WVDEP to do the job that good local land use guidelines and zoning should do. For example, the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed states that detention and retention ponds are not recommended on karst and categorize them as discouraged. Also, quoting WVDEP’s own karst guidance: “attenuating surface runoff will increase the rate of sinkhole formation and potential groundwater contamination.” Yet the entity currently planning to utilize this zoning change is planning employment of multiple massive retention ponds and attenuating surface runoff completely. This has already been approved by the DEP in two Construction Stormwater General Permit registrations for that company. One of detention ponds is not even regulated by the DEP as it contains process water and has no outlet. Clearly the DEP recognizes the risks but is not appropriately limiting them. Relying on the DEP to protect the public health, safety, welfare, and the environment from any entity in these karst locations is simply as the CNS bulletin said it “inadequate to safeguard the public and the environment.” We must have appropriate zoning that takes into consideration appropriate use of land with karst hydrogeology. Ordinance #2017-302 does not do this, but instead increases the risk to the public and the environment.

A second serious concern is the air emissions from the industry that this zoning will provide for. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. These types of air emissions have been shown to increase the risk of, contribute to, and exacerbate a multitude of developmental, physical, physiological, physiological, cognitive and economic. The exposure of one individual can cause repercussions in multiple generations. Embryos, fetuses, and children are most vulnerable with effects born out over a lifetime, and that of their offspring. Many of these effects only require short-term exposure and some have even been shown to occur at levels below current limits recommended by the World Health Organization. One example of this is that a recent study found that “Even within the limits set by the World Health Organization, the pollutants PM₁₀, SO₂, NO₂, and O₃ are associated with increased risk of treatment for respiratory diseases in children 0 to 6 years of age.” Unfortunately, the US limits are higher than WHO, 300 % higher in the case of PM₁₀!

In fact, in 2019, in the Advice from the Independent Particulate Matter Review Panel (formerly U.S. EPA Clean Air Scientific Advisory Committee Particulate Matter Review Panel) on EPA’s Policy Assessment for the Review of the National Ambient Air Quality Standards for Particulate Matter, it stated that the committee unanimously and unequivocally found that the current primary annual and 24-hour PM_{2.5} National Ambient Air Quality Standards (NAAQS) are not adequate to protect public health. The advice from this 20-member committee, whose scientific disciplines include epidemiology, medicine, toxicology, air quality measurement, air quality modeling, exposure assessment measurement and modeling, risk assessment, statistics, and others, was ignored due presumably to political pressure. Not only are the NAAQS too high in some cases, but due to the measure and mechanism by which they work, they can not replace the safety provided by good land use and zoning regulations, that are meant to do things like keep factories with air emissions and hundreds of heavy trucks away from elementary schools. In fact, there is a state law that prohibits siting a school near a factory. Unfortunately, the reciprocal law does not exist. Clearly, just like with the water resources, we cannot rely on the DEP or the EPA to do the job of what appropriate zoning should do. The whole point of zoning is to keep people safe and provide for their health and welfare. Ordinance #2017-302 puts families and school children directly in harms way.

The air emissions, threat to the groundwater, and the very presence of the industry that this zoning change will allow for will have a serious negative economic effect on those who live and or work closest to the site in question. Productivity and workforce participation will be negatively affected by the health effects of the air emissions. The local agricultural operations will be negatively affected by the air emissions with lower quantity and quality of crop yield and would be devastated if the ground water aquifer were fouled. The equine operations in the area, of which there are several, will be negatively affected by the air emissions as they affect the horses’ health and performance. The mere presence of the industry that will be provided for by this zoning change will cause property values to fall. There will be serious economic consequences for the immediate area around the site in question.

Several of the communities in the immediate area of the site for proposed zoning change are traditionally underserved and have lower economic status. The choice of this location for such a zoning change represents an egregious example of environmental injustice that should not be promulgated or tolerated.

This zoning change will provide for industry that will negatively affect the health safety and welfare of our community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Greg Harp

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Elizabeth Shockley

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask that you vote no on Ordinance #2017-302. While not in Ranson, the land and homes around the property that is the subject of the zoning change are closer to the property than anyone who currently lives within the city limits of Ranson. This area will be affected sooner and more harshly by the environmental issues that will develop secondary to the inappropriate siting of industry this zoning would allow.

The subject land has been well studied by Drs. Kozar, Doctor and Doctor and described in the scientific literature and USGS reports as having karst hydrology with very high aquifer vulnerability. The karst landscape is a consequence of the presence of soluble bedrock, which consists of limestone in the case of the subject land. In such landscapes water percolates through the ground and dissolves the underlying rock creating a porous network of caverns and throughways. Karst aquifers are known to be "extremely vulnerable to pollution" due to direct connection between the surface water and groundwater through both point (sinkholes) and diffuse (everywhere) infiltration. It is known from the Voluntary Remediation Plan of Jefferson Orchard that the groundwater at the subject site is only 60 feet below the ground. The subject property and much of the property around it are on an upland plain with few surface streams, but great seasonal variability in the water table resulting in numerous esteves and large amounts of water in the epikarst. This water is easily contaminated and this contamination spreads quickly throughout the aquifer. Dye tests performed near the subject site by the USGS have demonstrated this quick moving thorough dispersment in the aquifer in this area. While this contamination goes on to affect springs at the margins of the upland area continuing on in streams that service municipal water sources and the Potomac River, our concerns are far more immediate in both time and distance. Well water is the only water source available in the area of the proposed zoning change and, with the exception of Fox Glen, a majority of this water is supplied by private wells. Therefore, the groundwater aquifer fulfills a critical necessity, fulfilling all needs including human consumption, household uses, and agriculture and

maintenance of livestock and horses in the immediate area around the site. The concern is that if the aquifer becomes contaminated, then the local drinking water will be fouled.

For decades now, policy makers have been using “Aquifer Vulnerability,” to set land use and water resource protection policy. Karst has very high Aquifer Vulnerability. Therefore, this industrial use is not appropriate for this land and it should not be zoned for it. The guiding documents of the WVDEP recognize this. The introduction to the WVDEP document Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.”

The Chesapeake Bay Stormwater Network karst stormwater guidance document the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed, which the WVDEP cites in its own guiding document Stormwater Management Design in Karst Areas, clearly agrees stating:

“First, the effect of land development on karst terrain is complex and hard to predict, and requires professional analysis to reduce the risk of geological hazards, damage to infrastructure and groundwater contamination.” “The working group acknowledges that past approaches to stormwater and land development in karst terrain have been inadequate to safeguard the public and the environment.” “...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” We clearly need stronger comprehensive land use plans and zoning that direct new growth away from karst areas to more appropriate locations. Ordinance #2017-302 is literally the opposite of this.

Further, we cannot rely on the WVDEP to do the job that good local land use guidelines and zoning should do. For example, the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed states that detention and retention ponds are not recommended on karst and categorize them as discouraged. Also, quoting WVDEP’s own karst guidance: “attenuating surface runoff will increase the rate of sinkhole formation and potential groundwater contamination.” Yet the entity currently planning to utilize this zoning change is planning employment of multiple massive retention ponds and attenuating surface runoff completely. This has already been approved by the DEP in two Construction Stormwater General Permit registrations for that company. One of detention ponds is not even regulated by the DEP as it contains process water and has no outlet. Clearly the DEP recognizes the risks but is not appropriately limiting them. Relying on the DEP to protect the public health, safety, welfare, and the environment from any entity in these karst locations is simply as the CNS bulletin said it “inadequate to safeguard the public and the environment.” We must have appropriate zoning that takes into consideration appropriate use of land with karst hydrogeology. Ordinance #2017-302 does not do this, but instead increases the risk to the public and the environment.

A second serious concern is the air emissions from the industry that this zoning will provide for. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. These types of air emissions have been shown to increase the risk of, contribute to, and exacerbate a multitude of developmental, physical, physiological, physiological, cognitive and economic. The exposure of one individual can cause repercussions in multiple generations. Embryos, fetuses, and children are most vulnerable with effects born out over a lifetime, and that of their offspring. Many of these effects only require short-term exposure and some have even been shown to occur at levels below current limits recommended by the World Health Organization. One example of this is that a recent study found that “Even within the limits set by the World Health Organization, the pollutants PM₁₀, SO₂, NO₂, and O₃ are associated with increased risk of treatment for respiratory diseases in children 0 to 6 years of age.” Unfortunately, the US limits are higher than WHO, 300 % higher in the case of PM₁₀!

In fact, in 2019, in the Advice from the Independent Particulate Matter Review Panel (formerly U.S. EPA Clean Air Scientific Advisory Committee Particulate Matter Review Panel) on EPA’s Policy Assessment for the Review of the National Ambient Air Quality Standards for Particulate Matter, it stated that the committee unanimously and unequivocally found that the current primary annual and 24-hour PM_{2.5} National Ambient Air Quality Standards (NAAQS) are not adequate to protect public health. The advice from this 20-member committee, whose scientific disciplines include epidemiology, medicine, toxicology, air quality measurement, air quality modeling, exposure assessment measurement and modeling, risk assessment, statistics, and others, was ignored due presumably to political pressure. Not only are the NAAQS too high in some cases, but due to the measure and mechanism by which they work, they can not replace the safety provided by good land use and zoning regulations, that are meant to do things like keep factories with air emissions and hundreds of heavy trucks away from elementary schools. In fact, there is a state law that prohibits siting a school near a factory. Unfortunately, the reciprocal law does not exist. Clearly, just like with the water resources, we cannot rely on the DEP or the EPA to do the job of what appropriate zoning should do. The whole point of zoning is to keep people safe and provide for their health and welfare. Ordinance #2017-302 puts families and school children directly in harms way.

The air emissions, threat to the groundwater, and the very presence of the industry that this zoning change will allow for will have a serious negative economic effect on those who live and or work closest to the site in question. Productivity and workforce participation will be negatively affected by the health effects of the air emissions. The local agricultural operations will be negatively affected by the air emissions with lower quantity and quality of crop yield and would be devastated if the ground water aquifer were fouled. The equine operations in the area, of which there are several, will be negatively affected by the air emissions as they affect the horses’ health and performance. The mere presence of the industry that will be provided for by this zoning change will cause property values to fall. There will be serious economic consequences for the immediate area around the site in question.

Several of the communities in the immediate area of the site for proposed zoning change are traditionally underserved and have lower economic status. The choice of this location for such a zoning change represents an egregious example of environmental injustice that should not be promulgated or tolerated.

This zoning change will provide for industry that will negatively affect the health safety and welfare of our community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

The Ranson City Council has been presented with a vast body of credible information regarding the overwhelming dangers to our community here in Jefferson county and the surrounding areas from the Rockwool project. You have had ample time to refute or at least discuss the validity of that data but instead of doing so, your response to this presentation has been complete silence. You have given no analysis or informed response. You are supposed to be stewards of the public welfare. As such, you have an obligation to dialogue with your constituents and seriously consider their concerns and expertise. It has become apparent that you have no intention of doing so. Instead, you so predictably and steadfastly continue to engage every conceivable means whether barely legal or outright illegal to accomplish your end with impunity.

The data shows that Rockwool's operation will have irrefutable detrimental effects on the human health, economy, and general well being of Jefferson County. It follows then, that if said well being is then not your objective then what is it you intend to gain from this effort?

Sincerely,

Jim Webb
Shenandoah Junction, 25442

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask you to vote NO on Ordinance #2017-302. The industry this zoning change will allow for endangers the health, safety and, welfare of the community, and violates the premise of the smart code zoning that we have spent so much time, effort and federal money employing.

This zoning change will provide for industry that will negatively affect the agriculture industry in Jefferson County and beyond. The combination of the air emissions and threat to the ground water resources could have devastating consequences for the agricultural community of Jefferson County.

The comprehensive plan of Ranson is clear: it states, "the City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community." This land is ill-suited for an industrial facility due to its location and hydrogeology. Further, the industry that this zoning change will allow for will adversely affect the health, safety, and welfare of the community through its affect on the agricultural industry.

The agriculture industry in Jefferson County is hundreds of years old and continues to serve our community well today. According to the economic impact study "A Shared Agenda for Growing West Virginia's Agricultural Economy, Prepared by Fourth Economy for West Virginia Department Of Agriculture West Virginia University Extension Service 2012," Jefferson County is the second highest producing county for crops sales, third highest for fruits and vegetables sales, and in the top 9 counties for sales of animals and animal products.

Agriculture, tourism and the equine industries work synergistically to have an outsized positive impact on the economy in Ranson and Jefferson County as a whole. Agriculture drives tourism by creating agro-tourism opportunities, preserving beautiful open spaces that contribute to the

bucolic nature of our county, and providing the locally produced agriculture goods many tourists are look for in our markets and restaurants. Agriculture also supports the equine industry by providing local products like hay and straw, helping maintain pasture land, co-supporting local dual-purpose retail stores, and helping recycle by products. Agriculture helps maintain the way of life that many those who choose to live in Jefferson County enjoy. Industrial manufacturing and industry this zoning will provide for could never achieve these things.

Local agriculture also provides a source of locally produced agricultural goods. It has become apparent with the current pandemic and health emergency. This became a supply chain crisis because as our supply chains have moved to be ever more lean and efficient they lack resiliency and agility. By having a local source of agricultural goods and food we add resiliency and agility into our own economy and community. The agricultural industry in Jefferson County provides this.

A plethora of scientific studies have shown that a variety of air pollutants produced by the type of industry this zoning change would provide for causes decreased yields of both quantity and quality for several of the crops important to Jefferson County including winter wheat and soybeans. Soybeans and wheat are two of the crops significantly affected and two of the most prevalent crops in Jefferson County. Lower crop yields harm the farms and all the members of the down stream supply chain as well as the consumer. In this way, this zoning change will adversely affect the welfare of the community.

Recent studies have shown that even small increases in air pollution affect the productivity of agricultural workers. Similar to the reduction in crop yield this will negatively affect the individual workers, businesses, consumers and industry as a whole. In this way, this zoning change will adversely affect the health and welfare of individuals and the community.

Even more devastating is the possibility of groundwater contamination. The land at the subject location has karst hydrogeology and as such has porous bedrock and severe ground instability problems. The porous bedrock allows rapid diffuse infiltration of surface water into ground water and the severe ground instability problems leads to sinkhole development. Sinkholes provide direct connection of the surface water with the ground water aquifer through point infiltration. In fact, according to a 2012 study by Doctor and Doctor, the subject location and that of Terrapins Neck have the highest sinkhole vulnerability of any sites in Jefferson County. The propensity and easy of diffuse and point infiltration in areas of karst hydrogeology give them very high aquifer vulnerability meaning the aquifer is very vulnerable to contamination. For this reason, this measure has been used for decades by policymakers to set land use regulations. In this way, this zoning change and the industry it will provide for will adversely affect the welfare of the community.

The WVDEP recognizes development in car karst areas puts water resources high-risk for contamination but also recognizes that this is best protected against true local land use and zoning ordinances. WVDEP's guiding document Stormwater Management Design in Karst Areas

states, "it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." This document also references the Chesapeake Bay Stormwater Network karst stormwater guidance document the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed. In which it states "...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." Land use policy in Ranson and zoning need to take aquifer vulnerability into consideration as these agencies and documents suggest.

The Jefferson Orchards Voluntary Remediation Plan application reports that the ground water is only 60 feet from the surface at the site. It is described in the scientific literature that this land is an upland plane with large amounts of water in the epikarst, and contamination of this water effects the whole aquifer including the communications with surface water streams. A USGS study demonstrated that the groundwater adjacent to the site communicates readily with several surface water structures and wells miles away from the site. The effects of contamination at this site would go well beyond Ranson fouling large portions of the ground water and surface water in Jefferson County.

Groundwater contamination at the site would have devastating effects on the Agricultural industry in Jefferson county. For geographic and economic reasons it is simply infeasible for the agricultural industry to rely on utility provided water. Based on the scientific literature the site being considered for rezoning is one of the areas of highest aquifer vulnerability in Jefferson County and is inappropriate for the industry that this zoning change will provide for. This land is clearly ill-suited for industrial use and should not be zoned for it.

By threatening the local agricultural industry, the industry that this zoning will provide for will threaten the health, safety, and welfare of the community, and this land is not well-suited for industrial use. The Comprehensive Plan in Ranson is clear the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Gregory Mendez

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would negatively affect tourism, economic agility, groundwater quality, and individual health in neighboring municipalities like Shepherdstown. In doing these things the industry that this zoning change provides for will adversely affect the health, safety, and welfare of our community.

We have a growing, market-driven agricultural sector that would become devalued and that would actually potentially benefit more people than the heavy industry being considered.

Young people are moving/staying here to build innovative, environmentally friendly businesses to carry Jefferson County into a sustainable future.

Finally, good environmental quality is the basis for keeping our residents healthy and capable of working and learning. Children who are growing up here have had the benefit of robust outdoor play, and residents and their families have prized the outdoor recreation possible in a clean environment, such as fishing, boating, hiking, gardening, and even attending the racetrack.

Tourism is critically important to Shepherdstown's economy and to the county as a whole. In 2018, tourist spending in the Jefferson County contributed over \$170 million to state and local government revenue and \$213 million in individual earnings. Importantly, most of this money comes from tourists visiting from neighboring states like Virginia, Maryland, and Washington D.C. Out-of-state tourists are largely drawn to Jefferson County because of its reputation for environmental-friendly, sustainable industry. Key elements that support this reputation include the county's pastoral scenery and pristine natural resources. Ordinance #2017-302 will allow industry into Jefferson County that risks harming these elements and dramatically reducing the area's appeal to visitors. The resulting harm to our tourist industry would drive away visitors

and decrease state, county, and local revenue. The long-term success of Jefferson County's tourism industry is dependent on local governments making coordinated zoning decisions. Allowing certain types in industry in Ranson will negatively affect tourism in every municipality throughout the county, including Shepherdstown. Voting no on ordinance #2017-302 will protect the foundations of the county's tourism industry and protect the 7,040 jobs in Jefferson County that are directly supported by tourism. In this way the industry this zoning change will allow will adversely affect the welfare of our community.

The type of large, consolidated industry that ordinance #2017-302 would allow in Ranson would generally reduce the flexibility of local economies in Jefferson County. Historically, the driving industries in Jefferson County have been tourism, agriculture, and the equine industries. These three industries are large conglomerates of small businesses. Small business is very important to Shepherdstown. Small businesses have been shown to create more jobs, cultivate more innovation, and provide more opportunities than big, non-local firms. Additionally, small businesses have been shown to more reactive to sudden changes relative to manufacturing businesses. Bringing large, manufacturing-based industry into Jefferson county will depress the local economy and stifle innovation. During this time of economic upheaval and uncertainty, Jefferson County needs to support industries that will allow local economies to adapt and recover as fast as possible.

Voting no on ordinance #2017-302 will help protect water resources throughout Jefferson County. The type of industry that ordinance #2017-302 would allow puts the ground resources of Jefferson county at significant risk due to the karst hydrogeology. The site in Ranson is in the Rocky Marsh Run watershed, which is in the source water protection zone for Shepherdstown and drains to the Potomac River. Therefore, activity at this site will affect both groundwater and surface water streams. In municipalities like Shepherdstown, many residents and nearby farms depend on wells for water. Contamination of groundwater aquifers would create both health and remediation concerns for local residents. Dye tests performed by the USGS near the area of proposed rezoning in Ranson have shown just how far-reaching groundwater contamination at the Ranson site could be. Results from the USGS study revealed measurable dye concentrations in Elk's Run, Rattlesnake Run, and even the Shepherdstown Town Run. This last run cuts through the center of Shepherdstown and is a favorite area for children to play and learn to fish. In this way, the industry that this zoning change will allow will adversely affect the safety of our community.

Groundwater pollution is not the only concern for communities like Shepherdstown. The type of industry that ordinance #2017-302 would allow in Ranson would also generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. These pollutants are particularly harmful to children. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. The site in Ranson is across the road from an elementary school and also within the Jefferson High Middle district. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of children in Shepherdstown and all of Jefferson County. In this way, the industry that this zoning change will provide for will adversely affect the health of our community.

I again request that you vote no on ordinance #2017-302. This zoning change will allow industry that will adversely affect the health, safety, and welfare of our community. The long-term economic, environmental, and community health of municipalities like Shepherdstown depend on Ranson's participation in a coordinated zoning plan for all of Jefferson County.

Sincerely,

Sam Morgan

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask that you vote no on Ordinance #2017-302. While not in Ranson, the land and homes around the property that is the subject of the zoning change are closer to the property than anyone who currently lives within the city limits of Ranson. This area will be affected sooner and more harshly by the environmental issues that will develop secondary to the inappropriate siting of industry this zoning would allow.

The subject land has been well studied by Drs. Kozar, Doctor and Doctor and described in the scientific literature and USGS reports as having karst hydrology with very high aquifer vulnerability. The karst landscape is a consequence of the presence of soluble bedrock, which consists of limestone in the case of the subject land. In such landscapes water percolates through the ground and dissolves the underlying rock creating a porous network of caverns and throughways. Karst aquifers are known to be "extremely vulnerable to pollution" due to direct connection between the surface water and groundwater through both point (sinkholes) and diffuse (everywhere) infiltration. It is known from the Voluntary Remediation Plan of Jefferson Orchard that the groundwater at the subject site is only 60 feet below the ground. The subject property and much of the property around it are on an upland plain with few surface streams, but great seasonal variability in the water table resulting in numerous esteves and large amounts of water in the epikarst. This water is easily contaminated and this contamination spreads quickly throughout the aquifer. Dye tests performed near the subject site by the USGS have demonstrated this quick moving thorough dispersment in the aquifer in this area. While this contamination goes on to affect springs at the margins of the upland area continuing on in streams that service municipal water sources and the Potomac River, our concerns are far more immediate in both time and distance. Well water is the only water source available in the area of the proposed zoning change and, with the exception of Fox Glen, a majority of this water is supplied by private wells. Therefore, the groundwater aquifer fulfills a critical necessity, fulfilling all needs including human consumption, household uses, and agriculture and

maintenance of livestock and horses in the immediate area around the site. The concern is that if the aquifer becomes contaminated, then the local drinking water will be fouled.

For decades now, policy makers have been using “Aquifer Vulnerability,” to set land use and water resource protection policy. Karst has very high Aquifer Vulnerability. Therefore, this industrial use is not appropriate for this land and it should not be zoned for it. The guiding documents of the WVDEP recognize this. The introduction to the WVDEP document Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.”

The Chesapeake Bay Stormwater Network karst stormwater guidance document the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed, which the WVDEP cites in its own guiding document Stormwater Management Design in Karst Areas, clearly agrees stating:

“First, the effect of land development on karst terrain is complex and hard to predict, and requires professional analysis to reduce the risk of geological hazards, damage to infrastructure and groundwater contamination.” “The working group acknowledges that past approaches to stormwater and land development in karst terrain have been inadequate to safeguard the public and the environment.” “...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” We clearly need stronger comprehensive land use plans and zoning that direct new growth away from karst areas to more appropriate locations. Ordinance #2017-302 is literally the opposite of this.

Further, we cannot rely on the WVDEP to do the job that good local land use guidelines and zoning should do. For example, the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed states that detention and retention ponds are not recommended on karst and categorize them as discouraged. Also, quoting WVDEP’s own karst guidance: “attenuating surface runoff will increase the rate of sinkhole formation and potential groundwater contamination.” Yet the entity currently planning to utilize this zoning change is planning employment of multiple massive retention ponds and attenuating surface runoff completely. This has already been approved by the DEP in two Construction Stormwater General Permit registrations for that company. One of detention ponds is not even regulated by the DEP as it contains process water and has no outlet. Clearly the DEP recognizes the risks but is not appropriately limiting them. Relying on the DEP to protect the public health, safety, welfare, and the environment from any entity in these karst locations is simply as the CNS bulletin said it “inadequate to safeguard the public and the environment.” We must have appropriate zoning that takes into consideration appropriate use of land with karst hydrogeology. Ordinance #2017-302 does not do this, but instead increases the risk to the public and the environment.

A second serious concern is the air emissions from the industry that this zoning will provide for. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. These types of air emissions have been shown to increase the risk of, contribute to, and exacerbate a multitude of developmental, physical, physiological, physiological, cognitive and economic. The exposure of one individual can cause repercussions in multiple generations. Embryos, fetuses, and children are most vulnerable with effects born out over a lifetime, and that of their offspring. Many of these effects only require short-term exposure and some have even been shown to occur at levels below current limits recommended by the World Health Organization. One example of this is that a recent study found that “Even within the limits set by the World Health Organization, the pollutants PM₁₀, SO₂, NO₂, and O₃ are associated with increased risk of treatment for respiratory diseases in children 0 to 6 years of age.” Unfortunately, the US limits are higher than WHO, 300 % higher in the case of PM₁₀!

In fact, in 2019, in the Advice from the Independent Particulate Matter Review Panel (formerly U.S. EPA Clean Air Scientific Advisory Committee Particulate Matter Review Panel) on EPA’s Policy Assessment for the Review of the National Ambient Air Quality Standards for Particulate Matter, it stated that the committee unanimously and unequivocally found that the current primary annual and 24-hour PM_{2.5} National Ambient Air Quality Standards (NAAQS) are not adequate to protect public health. The advice from this 20-member committee, whose scientific disciplines include epidemiology, medicine, toxicology, air quality measurement, air quality modeling, exposure assessment measurement and modeling, risk assessment, statistics, and others, was ignored due presumably to political pressure. Not only are the NAAQS too high in some cases, but due to the measure and mechanism by which they work, they can not replace the safety provided by good land use and zoning regulations, that are meant to do things like keep factories with air emissions and hundreds of heavy trucks away from elementary schools. In fact, there is a state law that prohibits siting a school near a factory. Unfortunately, the reciprocal law does not exist. Clearly, just like with the water resources, we cannot rely on the DEP or the EPA to do the job of what appropriate zoning should do. The whole point of zoning is to keep people safe and provide for their health and welfare. Ordinance #2017-302 puts families and school children directly in harms way.

The air emissions, threat to the groundwater, and the very presence of the industry that this zoning change will allow for will have a serious negative economic effect on those who live and or work closest to the site in question. Productivity and workforce participation will be negatively affected by the health effects of the air emissions. The local agricultural operations will be negatively affected by the air emissions with lower quantity and quality of crop yield and would be devastated if the ground water aquifer were fouled. The equine operations in the area, of which there are several, will be negatively affected by the air emissions as they affect the horses’ health and performance. The mere presence of the industry that will be provided for by this zoning change will cause property values to fall. There will be serious economic consequences for the immediate area around the site in question.

Several of the communities in the immediate area of the site for proposed zoning change are traditionally underserved and have lower economic status. The choice of this location for such a zoning change represents an egregious example of environmental injustice that should not be promulgated or tolerated.

This zoning change will provide for industry that will negatively affect the health safety and welfare of our community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Don Kodak

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that will significantly harm the municipalities within Jefferson County and beyond effecting the health, welfare, and safety of our community. Harpers Ferry is a national treasure with the natural and historic resources tours flock to see each year and one of the communities that will be negatively impacted by this zoning change.

According to a 2019 study by the West Virginia Tourism Office, Jefferson County generated an average of \$178 million per year in tourism-derived revenue for state and local governments over the last 10 years, more than any other county in West Virginia by at least double. Tourism benefits the businesses and economy of Ranson and Jefferson County producing \$213.7 million in individual earning, 7040 jobs, and \$842.6 million in direct spending here in 2018. We would need 40 Project Shuttles to replace the individual earnings and 59 Rockwools to replace the jobs provided by the tourism industry in Jefferson County. It is important to note that most of the money generated by tourism in Jefferson County comes from neighboring states. In this way, it is like an export: not simply recycling money, but bringing money into the state increasing its wealth. Much of the economy in Harpers Ferry is based on this tourism industry. A threat to this industry poses a threat to the economy and welfare of our community.

One of the important drivers for tourism in Harpers Ferry is the Appalachian Trail. According to the Appalachian Trail Conservancy (ATC), Harpers Ferry is the psychologic midpoint of the Trail, and hikers often plan extended stays in Jefferson County with an obvious positive impact. The ATC reports that the smokestacks and associated lights will be visible in the viewshed of 15 vistas on the Appalachian Trail (AT). Studies have shown that quality of vistas and human impact on the environment are not only noticed by visitors, but effect their experience. Another study published in the Journal of Applied Recreation Research, found that points of interests and views drew visitors' attention and had a significant impact on their perception of the trail. It was also found that particularly beautiful vistas helped visitors overlook elements

that usually have a negative effect on trail experience like increased trail traffic. A 2009 study in Leisure Sciences revealed that scenic value was a perceptual theme of Appalachian Trail visitors, and that things as simple as dead trees visible in a vista can have a negative impact on visitors' overall perception. Imagine the effect the smokestacks will have from the 15 vistas from which they will be visible. The introduction of industrial activity made possible by the proposed rezoning in Ranson would have a negative effect on the scenic views of beautiful landscapes from the Appalachian Trail in Jefferson County.

The smokestacks are not all visitors will be able to see — the air pollution will create haze. The effect of regional haze on tourists was explored in a review article published in the Atmospheric Environment titled "Impaired visibility: the air pollution people see." A key takeaway on the negative affect of haze on vacationing tourists was summarized as follows:

"Vacations offer an escape from the routine and stress of our daily lives. Vacation destinations are often chosen based on their scenery; vacations are spent gazing at monuments, mountains, clouds, and oceans. Good visibility allows clear observation of distant features and appreciation of the inherent beauty of these scenes...Air pollution, which is often present in both our cities and parks, interferes with these attributes and can ruin the views vacationers travel to enjoy."

People seek bucolic, unspoiled areas to escape the stresses of urban areas. A 2004 study in Environment and Behavior found perceived pollution causes stress while viewing natural scenes has both psychological and physiological benefits, and a 2007 study confirmed these benefits. Two other studies found that people are emotionally affected by poor visibility, and tourists are disappointed when views are obscured by haze.

The combination of smokestacks and haze will mar the viewshed and will not only reduce the positive effects of a scenic landscape but also leave tourists disappointed and dissatisfied with their choice of destination. With these effects the welfare of the Harpers Ferry community would undoubtedly be endangered by the industry that this zoning change will provide for.

Multiple studies by doctors Kozar, Doctor, and Doctor have demonstrated that the land at this site to be rezoned is Karst with the highest likelihood of sinkhole development in the county, and that the groundwater aquifer there is incredibly sensitive to contamination from surface water. Further, this site is on an upland plain with relatively few surface streams, seasonal variability in the water table that results in numerous estavelles, and large amounts of water in the epikarst. In this area contamination in surface water communicates easily to the water in the epikarst via diffuse and point infiltration, and the springs at the margins of the upland area are directly affected by the water quality throughout the aquifer. According to Jefferson Orchards Voluntary Remediation Plan with the WVDEP, the groundwater at the site is approximately 60 feet below the ground, and the tests performed by the USGS have shown that groundwater from just adjacent to this site emerged in the headwaters of both the Elk's Run and Rattlesnake Run. This is critically important for Harpers Ferry because the Elk's Run headwaters is a spring about three miles southeast of the site and goes on to become the drinking water source for Harpers Ferry and Bolivar before emptying into the Potomac River.

The headwaters of Rattlesnake Run is a spring about 3.5 miles from the site and is also a tributary of the Potomac River. The Potomac River is the back up water source for Harpers Ferry. This means that the activity at the site will have a critical influence on the drinking water of Harpers Ferry. In this was the industry permitted by this change in zoning would undoubtedly endanger the health and safety of the community in Harpers Ferry.

The untoward health effects and individual economic consequences from the pollution emissions of the industry this rezoning will allow that will be born out over the length of people's lives and that of their decedents for at least three generations is an egregious example of environmental injustice that should not be tolerated. This zoning change may be in one of the poorest sections of the county, but the effects will be felt in every part of Ranson and the county.

The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." The industry that this rezoning will allow will jeopardize the health, safety and welfare of Ranson, Harpers Ferry and the whole county. Please vote no on the ordinance #2017-302.

Sincerely,

Jennifer Lamb

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Scott Caldwell

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

With all this economic loss, increase in environmental degradation and concomitant negative effects on the health and welfare of the residents of Jefferson County, in addition to clearly threatening the vital water supply to 80% of the those who depend on it, it is hard to fathom the rationale of the Ranson politicians who have clearly disregarded the needs and clear intentions of the citizens who diligently formulated the original 2012 Comprehensive Plan to benefit the people of Jefferson County, their way of life, their means of earning a living, and their ability to maintain a healthy environment and healthy future for their families, rather than

pad the pockets of a few with no regard for doing the right thing. A terrible legacy for those
pols to leave for themselves and their families.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not
adversely affect the health, safety, or welfare of the community.” This zoning change would
clearly adversely affect the health, safety, and welfare of the community. The Comprehensive
Plan further states, “the City will designate ample land that is well-suited for industrial
facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it.
Therefore, the council should vote no on the zoning change. Please vote no on the ordinance
#2017-302.

Sincerely,

Sharon and Michael Helman-Harman

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change.

This is just another project that will end up COSTING taxpayers more to clean up from the toxic air and poisoned water than it will ever provide in economic benefit. The number of jobs is minimal and hardly worth the massive cost to this lovely area and the surrounding communities, particularly given that they were offered a package where their contribution to the tax base is not sufficient. If anything, this sort of industry will drive people and other businesses away from the area. This would be a terrible mistake. Please vote no on the ordinance #2017-302.

Sincerely,

Kay Kodak

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would have a negative effect on water and air quality in neighboring states such as Maryland.

The Potomac River provides drinking water and a source of recreation to Maryland residents. Water and air pollution generated within the Potomac River's watershed will inevitably contaminate this valuable waterway. The site of the proposed zoning change in Ranson is located within the Potomac River Watershed.

The type of industry that ordinance #2017-302 would allow in Ranson would utilize large water impoundments, in an area of known karst terrain. This water will be contaminant from several sources including particulate mater that has fallen out from the air emissions and process water. The West Virginia Department of Environmental Protection has published guidelines that specifically discourage extensive development in areas of karst terrain because of the vulnerability of karst aquifers to contamination by surface pollution. Karst features increase surface water and groundwater connectivity and any spills or surface releases quickly percolate into the groundwater. Additionally, sinkholes are common in karst terrain and can cause ruptures in wastewater impoundments. Even if appropriate attempts are made to contain and manage wastewater and other stormwater runoff on-site, there is still a high risk that wastewater could contaminate the groundwater through tears and catastrophic failure of wastewater impoundments. Contaminated groundwater in karst terrain can easily resurface in waterways several miles away, as shown by a USGS tracer study conducted near the site in to be rezoned. The USGS study detected tracer dye in multiple springs and waterways miles from the initial injection site in Ranson. All of these waterways drain into the Potomac River.

Mismanagement of wastewater could also lead to contamination of nearby surface waters. For example, the site of the proposed rezoning in Ranson is in the Rocky Marsh Run watershed.

Rocky Marsh Run also drains to the Potomac River. Voting no on ordinance #2017-302 will preserve downstream water quality and help ensure that the Potomac River remains usable for Maryland residents.

Air pollution poses another risk to Maryland residents. The type of industry that ordinance #2017-302 would allow would generate air pollutants like fine particulate matter. According to the US EPA, fine particulates can travel 100s of miles from its original source. Air pollution related to industrial activity in Ranson could easily reach Maryland. Fine particulates have a greater affinity for carrying toxic compounds and their small size allows them to be inhaled more deeply into the lungs. Chronic exposure to fine particulate matter is associated with increased risk of several diseases including Alzheimer's in adults. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease among others. Fine particulate matter also exacerbates regional haze which creates a visible reminder of air pollution. The psychological effects that arise from an increased perception of pollution include stress, anxiety, and unhappiness. Voting no on ordinance #2017-302 will help prevent increased air pollution from negatively affecting the long-term health of Maryland residents.

The industry that this zoning will provide for will threaten the health, safety, and welfare of the residents in Maryland, and this land is not well-suited for industrial use. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." To achieve this, the council must not approve this proposed zoning change.

I again request that you vote no on ordinance #2017-302. Zoning decisions in Ranson and Jefferson County have an undeniable influence on the quality of life in neighboring states.

Sincerely,

Linda Coyle
Frederick, 21701

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

As an organic vegetable farmer for the last 16 years in Charles Town, I am deeply concerned with the negative impact Rockwool will have on my livelihood and wellbeing. Healthy produce requires clean water and air to be viable. I am also outside all day long, therefore I will be exposed to higher levels of particulates and other pollutants. I love my life, my family and friends, and our home here in Jefferson co. Please protect us from this industry that is willing to bring toxic harm to our community, only to benefit few others far away from our home. I respectfully ask you to vote NO on Ordinance #2017-302. The industry this zoning change will allow for endangers the health, safety and, welfare of the community, and violates the premise of the smart code zoning that we have spent so much time, effort and federal money employing.

This zoning change will provide for industry that will negatively affect the agriculture industry in Jefferson County and beyond. The combination of the air emissions and threat to the ground water resources could have devastating consequences for the agricultural community of Jefferson County.

The comprehensive plan of Ranson is clear: it states, "the City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community." This land is ill-suited for an industrial facility due to its location and hydrogeology. Further, the industry that this zoning change will allow for will adversely affect the health, safety, and welfare of the community through its affect on the agricultural industry.

The agriculture industry in Jefferson County is hundreds of years old and continues to serve our community well today. According to the economic impact study "A Shared Agenda for Growing West Virginia's Agricultural Economy, Prepared by Fourth Economy for West Virginia Department Of Agriculture West Virginia University Extension Service 2012," Jefferson County

is the second highest producing county for crops sales, third highest for fruits and vegetables sales, and in the top 9 counties for sales of animals and animal products.

Agriculture, tourism and the equine industries work synergistically to have an outsized positive impact on the economy in Ranson and Jefferson County as a whole. Agriculture drives tourism by creating agro-tourism opportunities, preserving beautiful open spaces that contribute to the bucolic nature of our county, and providing the locally produced agriculture goods many tourists are look for in our markets and restaurants. Agriculture also supports the equine industry by providing local products like hay and straw, helping maintain pasture land, co-supporting local dual-purpose retail stores, and helping recycle by products. Agriculture helps maintain the way of life that many those who choose to live in Jefferson County enjoy. Industrial manufacturing and industry this zoning will provide for could never achieve these things.

Local agriculture also provides a source of locally produced agricultural goods. It has become apparent with the current pandemic and health emergency. This became a supply chain crisis because as our supply chains have moved to be ever more lean and efficient they lack resiliency and agility. By having a local source of agricultural goods and food we add resiliency and agility into our own economy and community. The agricultural industry in Jefferson County provides this.

A plethora of scientific studies have shown that a variety of air pollutants produced by the type of industry this zoning change would provide for causes decreased yields of both quantity and quality for several of the crops important to Jefferson County including winter wheat and soybeans. Soybeans and wheat are two of the crops significantly affected and two of the most prevalent crops in Jefferson County. Lower crop yields harm the farms and all the members of the down stream supply chain as well as the consumer. In this way, this zoning change will adversely affect the welfare of the community.

Recent studies have shown that even small increases in air pollution affect the productivity of agricultural workers. Similar to the reduction in crop yield this will negatively affect the individual workers, businesses, consumers and industry as a whole. In this way, this zoning change will adversely affect the health and welfare of individuals and the community.

Even more devastating is the possibility of groundwater contamination. The land at the subject location has karst hydrogeology and as such has porous bedrock and severe ground instability problems. The porous bedrock allows rapid diffuse infiltration of surface water into ground water and the severe ground instability problems leads to sinkhole development. Sinkholes provide direct connection of the surface water with the ground water aquifer through point infiltration. In fact, according to a 2012 study by Doctor and Doctor, the subject location and that of Terrapins Neck have the highest sinkhole vulnerability of any sites in Jefferson County. The propensity and easy of diffuse and point infiltration in areas of karst hydrogeology give them very high aquifer vulnerability meaning the aquifer is very vulnerable to contamination. For this reason, this measure has been used for decades by policymakers to set land use

regulations. In this way, this zoning change and the industry it will provide for will adversely affect the welfare of the community.

The WVDEP recognizes development in karst areas puts water resources high-risk for contamination but also recognizes that this is best protected against true local land use and zoning ordinances. WVDEP's guiding document Stormwater Management Design in Karst Areas states, "it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." This document also references the Chesapeake Bay Stormwater Network karst stormwater guidance document the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed. In which it states "...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." Land use policy in Ranson and zoning need to take aquifer vulnerability into consideration as these agencies and documents suggest.

The Jefferson Orchards Voluntary Remediation Plan application reports that the ground water is only 60 feet from the surface at the site. It is described in the scientific literature that this land is an upland plane with large amounts of water in the epikarst, and contamination of this water effects the whole aquifer including the communications with surface water streams. A USGS study demonstrated that the groundwater adjacent to the site communicates readily with several surface water structures and wells miles away from the site. The effects of contamination at this site would go well beyond Ranson fouling large portions of the ground water and surface water in Jefferson County.

Groundwater contamination at the site would have devastating effects on the Agricultural industry in Jefferson county. For geographic and economic reasons it is simply infeasible for the agricultural industry to rely on utility provided water. Based on the scientific literature the site being considered for rezoning is one of the areas of highest aquifer vulnerability in Jefferson County and is inappropriate for the industry that this zoning change will provide for. This land is clearly ill-suited for industrial use and should not be zoned for it.

By threatening the local agricultural industry, the industry that this zoning will provide for will threaten the health, safety, and welfare of the community, and this land is not well-suited for industrial use. The Comprehensive Plan in Ranson is clear the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,
Robert Young, owner Young Harvests farm

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

As a Jefferson County resident, born and raised in Jefferson County, I respectfully ask you to vote NO on Ordinance #2017-302. The industry this zoning change will allow for endangers the health, safety and, welfare of the community, and violates the premise of the smart code zoning that we have spent so much time, effort and federal money employing.

As a young person growing up in West Virginia, I was active in 4-H on both the county and state levels. Now I am striving to create my own small farm. This is the real Jefferson County! Please save our Beauty, our Rural Character, our Farming Heritage. Please vote against this zoning change that would open us to exploitation by outside interests.

This zoning change will provide for industry that will negatively affect the agriculture industry in Jefferson County and beyond. The combination of the air emissions and threat to the ground water resources could have devastating consequences for the agricultural community of Jefferson County.

The comprehensive plan of Ranson is clear: it states, "the City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community." This land is ill-suited for an industrial facility due to its location and hydrogeology. Further, the industry that this zoning change will allow for will adversely affect the health, safety, and welfare of the community through its affect on the agricultural industry.

The agriculture industry in Jefferson County is hundreds of years old and continues to serve our community well today. According to the economic impact study "A Shared Agenda for Growing West Virginia's Agricultural Economy, Prepared by Fourth Economy for West Virginia Department Of Agriculture West Virginia University Extension Service 2012," Jefferson County

is the second highest producing county for crops sales, third highest for fruits and vegetables sales, and in the top 9 counties for sales of animals and animal products.

Agriculture, tourism and the equine industries work synergistically to have an outsized positive impact on the economy in Ranson and Jefferson County as a whole. Agriculture drives tourism by creating agro-tourism opportunities, preserving beautiful open spaces that contribute to the bucolic nature of our county, and providing the locally produced agriculture goods many tourists are look for in our markets and restaurants. Agriculture also supports the equine industry by providing local products like hay and straw, helping maintain pasture land, co-supporting local dual-purpose retail stores, and helping recycle by products. Agriculture helps maintain the way of life that many those who choose to live in Jefferson County enjoy. Industrial manufacturing and industry this zoning will provide for could never achieve these things.

Local agriculture also provides a source of locally produced agricultural goods. It has become apparent with the current pandemic and health emergency. This became a supply chain crisis because as our supply chains have moved to be ever more lean and efficient they lack resiliency and agility. By having a local source of agricultural goods and food we add resiliency and agility into our own economy and community. The agricultural industry in Jefferson County provides this.

A plethora of scientific studies have shown that a variety of air pollutants produced by the type of industry this zoning change would provide for causes decreased yields of both quantity and quality for several of the crops important to Jefferson County including winter wheat and soybeans. Soybeans and wheat are two of the crops significantly affected and two of the most prevalent crops in Jefferson County. Lower crop yields harm the farms and all the members of the down stream supply chain as well as the consumer. In this way, this zoning change will adversely affect the welfare of the community.

Recent studies have shown that even small increases in air pollution affect the productivity of agricultural workers. Similar to the reduction in crop yield this will negatively affect the individual workers, businesses, consumers and industry as a whole. In this way, this zoning change will adversely affect the health and welfare of individuals and the community.

Even more devastating is the possibility of groundwater contamination. The land at the subject location has karst hydrogeology and as such has porous bedrock and severe ground instability problems. The porous bedrock allows rapid diffuse infiltration of surface water into ground water and the severe ground instability problems leads to sinkhole development. Sinkholes provide direct connection of the surface water with the ground water aquifer through point infiltration. In fact, according to a 2012 study by Doctor and Doctor, the subject location and that of Terrapins Neck have the highest sinkhole vulnerability of any sites in Jefferson County. The propensity and easy of diffuse and point infiltration in areas of karst hydrogeology give them very high aquifer vulnerability meaning the aquifer is very vulnerable to contamination. For this reason, this measure has been used for decades by policymakers to set land use

regulations. In this way, this zoning change and the industry it will provide for will adversely affect the welfare of the community.

The WVDEP recognizes development in karst areas puts water resources high-risk for contamination but also recognizes that this is best protected against true local land use and zoning ordinances. WVDEP's guiding document Stormwater Management Design in Karst Areas states, "it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." This document also references the Chesapeake Bay Stormwater Network karst stormwater guidance document the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed. In which it states "...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." Land use policy in Ranson and zoning need to take aquifer vulnerability into consideration as these agencies and documents suggest.

The Jefferson Orchards Voluntary Remediation Plan application reports that the ground water is only 60 feet from the surface at the site. It is described in the scientific literature that this land is an upland plane with large amounts of water in the epikarst, and contamination of this water effects the whole aquifer including the communications with surface water streams. A USGS study demonstrated that the groundwater adjacent to the site communicates readily with several surface water structures and wells miles away from the site. The effects of contamination at this site would go well beyond Ranson fouling large portions of the ground water and surface water in Jefferson County.

Groundwater contamination at the site would have devastating effects on the Agricultural industry in Jefferson county. For geographic and economic reasons it is simply infeasible for the agricultural industry to rely on utility provided water. Based on the scientific literature the site being considered for rezoning is one of the areas of highest aquifer vulnerability in Jefferson County and is inappropriate for the industry that this zoning change will provide for. This land is clearly ill-suited for industrial use and should not be zoned for it.

By threatening the local agricultural industry, the industry that this zoning will provide for will threaten the health, safety, and welfare of the community, and this land is not well-suited for industrial use. The Comprehensive Plan in Ranson is clear the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Windsong Bergman

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Neryl Gentry

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask you to vote NO on Ordinance #2017-302. The industry this zoning change will allow for endangers the health, safety and, welfare of the community, and violates the premise of the smart code zoning that we have spent so much time, effort and federal money employing.

Any change in zoning needs to align with the comprehensive plan. In Ranson's current comprehensive plan (2012), the city only refers to "heavy industry" in the history section. Here it is characterized as part of a bygone era that has been replaced by an emphasis on agriculture for local food production, open spaces, and quality-of-life. In the remainder of the document, the word industry is used loosely to describe businesses including flower shops and shoe stores. Nothing that resembles the industry that this zoning change will provide for is described in the current comprehensive plan of Ranson.

In the land use section of the comprehensive plan, number ten states:

"Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The comprehensive plan clearly states that the city will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community. This change in zoning clearly negatively affects the health, safety, and welfare of the community.

As the zoning is proposed, the industry that this zoning change will allow for will be directly across the street from houses, parks and other small businesses. A densely populated subdivision and an elementary school already exit directly across the street. While these latter

community sections are not in the city limits, the effect of this zoning on them should still be considered just the same as it would be if they were in the city limits.

The industry that this zoning change will provide for will produce particulate, gaseous, and hazardous air emissions. These emissions have been shown to be detrimental to human health at every stage of life from embryo to old age. In utero and childhood exposure are the most damaging with lasting effects being realized through out life, and with maternal exposure the effects can be felt for generations. Multiple organ systems are affected including respiratory, cardiovascular, neurologic, immune, and endocrine causing defects in multiple processes including in utero development, neurodevelopment, immune and tolerance development, and cognitive defects. There are also psychological, social, and economic effects from both perceived and actual air pollution in both children and adults. Many of these effects can be seen even with short-term exposure or exposure that is lower than the levels recommended by the US Environmental Protection Agency and World Health Organization. These consequences are devastating to the individual and depressing to the local community and economy. State law does not allow a school to be built next to industry that this zoning will allow but yet we are contemplating changing the zoning so this industry can build next to a school. This does not make sense. As Ranson residents, we want Ranson to follow the lead of the state and keep polluting industry away from kids. In these ways, this change in zoning will negatively affect the health and welfare of the community.

In addition to the health effects of the air emissions is the threat to groundwater from the industry that this zoning change would allow. The land in question has karst hydrogeology and therefore very high aquifer vulnerability and is not appropriate for this industry. With the type of industry this zoning will provide for, combined with high aquifer vulnerability, the likelihood of groundwater contamination is too high for the community and region to bear. A USGS study demonstrated that contamination in the groundwater adjacent to the site moves relatively quickly and can be found in wells and surface water structures in a variety of locations in the County. In this way, contamination at the site would affect the drinking water of the great majority of Jefferson County residents. Through the surface water connections, the water at the site also affects the water resources of the region.

Aquifer vulnerability has been used by policy makers for decades to set land use regulations. The guiding document, from the WVDEP, Stormwater Management Design in Karst Areas states, "it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." In Ranson, we need to follow this advice and not change the zoning of this land for use by industry that has among the highest aquifer vulnerability in the County. This zoning change will endanger the safety of the community and region by endangering the safe water resources. As Ranson residents, we want to safeguard the water resources of the county and region by following the WVDEP guidance here.

Further, by reallocating this transect district and replacing it with a monolithic block of Special District Industrial designation, hundreds of housing units, parks and space for small businesses are lost. Ranson loses the potential for property tax on these properties and their improvements, Business and Occupational tax on the businesses and sales tax in retail stores. The community loses out on the opportunity to develop affordable housing and create locations where people can live, work, play, and shop all in the same place reducing the need for travel.

Worse yet apparently a deal has been made where the entity that owns the subject land has required that a litany of things not be built on the adjacent land essentially stripping the purpose of the smart code transect zone that exists there. Transect zones in the smart code are meant to transition, from out to in, and provide communities where people can safely work and live in close proximity in an effort to reduce travel. Excluding many of the components of the transect zone effectively eliminates the features that make it a transect zone, thus, losing the benefits a transect zone offers the community and city. By losing these benefits, reducing the overall and affordable housing prospects, and reducing so drastically the opportunities for city income, this zoning change will negatively affect the welfare of the community.

As Ranson residents, we find it odd that we are changing zoning to provide for industry that we would not put in the middle of our town close to our residents, but we are placing it close to the homes of county residents. Further, it is striking that the area where this change in zoning is directly adjacent to historically underserved lower income communities and a Title I school. This amounts to environmental injustice and cannot be tolerated.

The purpose of zoning is for a city to protect the health, welfare, morals and safety of the community. In this case, the air emissions and heavy truck traffic will endanger the communities' health. The threat of water contamination will endanger the safety of the community. The effect of lost productivity and decreased workforce participation due to increased illness and the negative effect the air emissions and presence of such a factory will have on the local economy will negatively affect the welfare of the community. The environmental injustice of changing the zoning to accommodate such polluting industry in a location where your municipality has no residents, but yet hundreds of low income and underserved county residents live is egregiously amoral. This must not happen. We respectfully implore you to do the right thing and vote no on ordinance #2017-302.

Sincerely,

Karen Buck

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Leslie Boyd

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on Ordinance #2017-302. Ranson's proposed zoning change presents a significant risk to the equine industry in Jefferson County and well beyond. The type of industry that would be allowed by the proposed zoning change in this location would jeopardize horse health, the groundwater supply, and workforce productivity. This will cause immediate shrinkage and threaten the long-term viability of the equine industry in the county. In doing so, the industry this zoning change will allow for will adversely affect the health, safety, and welfare of our community.

I would like to start a new business in Ranson but cant due to this.

The site of the proposed rezoning is less than six miles from Charles Town Races, with several breeding, training, and rehabilitation facilities between the two. The industry allowed by this rezoning would produce particulate, gaseous, and hazardous air emissions that would reach these sites. According to the WVDEP air permit, the Rockwool plant in Ranson is permitted to emit 250.87 tons of particulate matter per year into the air (1).

According to a recent study published in the journal of Veterinary Internal Medicine (2), horses are 15 times more sensitive to inhaled particulate matter than humans. Inhaled particulate matter can cause inflammation in horses' lungs that negatively affects performance. Inhaled particulate matter also contributes to the development of inflammatory airway disease (IAD) (3). IAD is a chronic airway disease that can affect horses long after their racing career is over. While there is little research on how other air pollutants affect horses, the effects of pollution on humans can be used to infer potential impact on horses. However unlike human models, these horses are elite athletes continuously exposed, and will thus likely experience detrimental effects at much lower levels of air pollution than humans.

The primary concern with air pollution is that increased levels of pollutants will increase inflammation in horses' lungs. Even small, subclinical amounts of inflammation in the lungs of horses negatively affect performance (2,3,4,5,6,11). This inflammation can also cause increased recovery times following racing (7,11). Reduced performance and training interruptions can lead to higher risk of injury, reduced winning average, fewer yearly starts, lower yearly earnings, shortened career length, fewer lifetime starts, reduced lifetime earnings, and reduced quality of life (2,3,8,9,11). Each of these situations will lead to decreased return on investment, decreased cash flow, and decreased overall earnings for owners, trainers, and breeders with horses at Charles Town Races and in nearby areas. In this way, the industry this zoning will allow will adversely affect the welfare of our community.

While racing is usually a thoroughbred's first career, it is rarely their last. Some racing horses go on to be breeding stock, while others will have successful careers as sport horses. Jefferson County is an important source of new stock for sport horse trainers from Northern Virginia, and Maryland, and this is a resource for local horseman of both income and placement for horses not appropriate for breeding. However, if retired racehorses are unsound from injury or respiratory disease, they can be difficult to manage as breeding stock or unfit for a career as a sport horse. This affects the horse's quality of life and also places a burden on the industry locally and regionally. In this way, the industry this zoning will provide for will adversely affect the welfare of our community.

The perception of decreased air quality from the increase in regional haze and visible smokestacks as one drives into the county will deter out of state owners and breeders from investing in West Virginia bred Race horses, decreasing or eliminating a critical \$50 million a year source of local business volume. In this way, the industry this zoning will provide for will adversely affect the welfare of our community.

Another concern related to the proposed rezoning in Ranson is the risk of groundwater contamination as a result of the karst hydrogeology at the site and the industrial activity. Horsemen will either have to take on the expense of periodically testing water sources or they may not know local ground water is contaminated until their animals are sick. Veterinary care and testing adds expense and uncertainty to an industry that already deals with large inherent risks. The actual occurrence of ground water contamination would be devastating for Jefferson County's equine industry. For both geographic and financial reasons, it is simply impossible to think that the industry could solely use public or private utility-provided water if industrial activity fouled the local groundwater. In this way, the industry this zoning will provide for will adversely affect the health, safety, and welfare of our community.

Finally, studies on US agricultural workers have demonstrated that increased air pollution decreases productivity of outdoors workers. This would place an additional burden on workers, small business owners and the industry. In this way the industry this zoning will provide for will adversely affect the health, safety, and welfare of our community.

The equine industry in Jefferson County is hundreds of years old. It is not worth risking this historic and economically valuable industry by rezoning for industrial companies like Rockwool. An economic impact study of the Charles Town Thoroughbred Horse Racing Industry on Jefferson County's economy found that the spending by owners, breeders, and trainers of the equine industry directly contributes \$79.4 million to the county each year. Out-of-state owners, breeders, and trainers spend more than \$50 million in Jefferson County every year. The value of total business volume in Jefferson County is \$191 million each year (10). These numbers do not include the effect of the handle or the casino.

The equine industry provides jobs for a broad cross-section of the public. This industry offers individuals of any educational background a variety of paths to achieve a good middle-income living. Many jobs allow individuals to pursue apprenticeships or on-the-job training rather than requiring a costly college education. This flexibility allows for greater lifetime earnings and improved educational debt-to-earnings ratio for these workers. The equine industry also provides opportunities for non-traditional workers by offering job opportunities to those who may not be employable by larger corporations. This industry provides a variety of full-time, part-time, flexible, and pick-up work. Encouraging this type of flexible job ecosystem helps create a healthy economy with broad participation in employment and consumption.

The equine industry is a large conglomerate of small businesses, which have a multitude of economic benefits over having a few large businesses. It has been extensively reported that small locally owned businesses and start ups create more jobs, cultivate innovation, generate higher incomes, and provide more opportunities for individuals that would otherwise not exist than big non-local firms, which can actually depress local economies. The equine industry provides opportunities for small businesses and startups responsible for this growth of better jobs that are so good for the economy.

The equine industry offers so many other benefits that the industry in the rezoned area would not. For example, the equine industry supports local agriculture by providing a market for agricultural goods such as straw. The robust straw market supported by owners, trainers, and breeders allows for a third cash crop to be produced from one field in a year. Through pastureland and support of local agricultural goods, the equine industry protects and preserves the open spaces that give our county its bucolic quality and help attract tourists. Through the breeders' incentive programs, the equine industry offers unique opportunities to draft state funds back to Jefferson County, to name a few.

Rezoning this area of Ranson for Special District Industrial will allow in entities whose activities are harmful to the equine industry. The losses incurred by the equine industry would far outweigh any benefits derived from industries occupying the rezoned area. Sacrificing the long-term viability of one of our oldest and most productive industries for a net loss in business volume and economic value just does not make good sense for the local economy. This zoning change would provide for industry that would adversely affect the health, safety and welfare of our communities. Please vote NO on Ordinance #2017-302.

Sincerely,

Christine Wimer

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on Ordinance #2017-302. Ranson's proposed zoning change presents a significant risk to the equine industry in Jefferson County and well beyond. The type of industry that would be allowed by the proposed zoning change in this location would jeopardize horse health, the groundwater supply, and workforce productivity. This will cause immediate shrinkage and threaten the long-term viability of the equine industry in the county. In doing so, the industry this zoning change will allow for will adversely affect the health, safety, and welfare of our community.

My horse farm is just a few short miles from the proposed zoning change. If industry moves this close to my farm, it will be detrimental to my business and my herd.

The site of the proposed rezoning is less than six miles from Charles Town Races, with several breeding, training, and rehabilitation facilities between the two. The industry allowed by this rezoning would produce particulate, gaseous, and hazardous air emissions that would reach these sites. According to the WVDEP air permit, the Rockwool plant in Ranson is permitted to emit 250.87 tons of particulate matter per year into the air (1).

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would have a negative effect on water and air quality in neighboring states such as Maryland.

The Potomac River provides drinking water and a source of recreation to Maryland residents. Water and air pollution generated within the Potomac River's watershed will inevitably contaminate this valuable waterway. The site of the proposed zoning change in Ranson is located within the Potomac River Watershed.

The type of industry that ordinance #2017-302 would allow in Ranson would utilize large water impoundments, in an area of known karst terrain. This water will be contaminant from several sources including particulate mater that has fallen out from the air emissions and process water. The West Virginia Department of Environmental Protection has published guidelines that specifically discourage extensive development in areas of karst terrain because of the vulnerability of karst aquifers to contamination by surface pollution. Karst features increase surface water and groundwater connectivity and any spills or surface releases quickly percolate into the groundwater. Additionally, sinkholes are common in karst terrain and can cause ruptures in wastewater impoundments. Even if appropriate attempts are made to contain and manage wastewater and other stormwater runoff on-site, there is still a high risk that wastewater could contaminate the groundwater through tears and catastrophic failure of wastewater impoundments. Contaminated groundwater in karst terrain can easily resurface in waterways several miles away, as shown by a USGS tracer study conducted near the site in to be rezoned. The USGS study detected tracer dye in multiple springs and waterways miles from the initial injection site in Ranson. All of these waterways drain into the Potomac River.

Mismanagement of wastewater could also lead to contamination of nearby surface waters. In this way, this zoning change and the industry it will provide for will adversely affect the welfare

of the community. For example, the site of the proposed rezoning in Ranson is in the Rocky Marsh Run watershed. Rocky Marsh Run also drains to the Potomac River. Voting no on ordinance #2017-302 will preserve downstream water quality and help ensure that the Potomac River remains usable for Maryland residents.

Air pollution poses another risk to Maryland residents. The type of industry that ordinance #2017-302 would allow would generate air pollutants like fine particulate matter. According to the US EPA, fine particulates can travel 100s of miles from its original source. Air pollution related to industrial activity in Ranson could easily reach Maryland. Fine particulates have a greater affinity for carrying toxic compounds and their small size allows them to be inhaled more deeply into the lungs. Chronic exposure to fine particulate matter is associated with increased risk of several diseases including Alzheimer's in adults. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease among others. Fine particulate matter also exacerbates regional haze which creates a visible reminder of air pollution. The psychological effects that arise from an increased perception of pollution include stress, anxiety, and unhappiness. Voting no on ordinance #2017-302 will help prevent increased air pollution from negatively affecting the long-term health of Maryland residents.

The industry that this zoning will provide for will threaten the health, safety, and welfare of the residents in Maryland. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." To achieve this, the council must not approve this proposed zoning change.

I again request that you vote no on ordinance #2017-302. Zoning decisions in Ranson and Jefferson County have an undeniable influence on the quality of life in neighboring states.

Sincerely,

Sandra Shepherd

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Virginia Winston

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote NO on Ordinance #2017-302. This rezoning will put an undue hardship on the wastewater treatment systems, burden the rate payers and risk surface waterways in Charles Town, risking the health, safety and welfare of the community. The comprehensive plan of Ranson states, the City "will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community." Therefore, please vote NO on #2017-302.

The nature of the industry that this zoning will allow will be harmful to our local economy. Charles Town has spent a lot of time and money improving our downtown area for restaurants and retail. We are working to take advantage of the tourism industry in our county and bring more people into Charles Town. The eye sore, noise pollution, air pollution, and obvious move away from sustainability will drive people away from Jefferson County and Charles Town, rendering our efforts ineffective and unrewarding. This will make it harder for our small businesses to be successful. In this way, the industry this zoning will provide for will adversely affect the welfare of our community.

According to the 2018 WVU economic study of the eastern panhandle, over 40% of the workforce in Jefferson County choose to work outside of the state. These commuters bring that money home and spend it here supporting our local small businesses, economy and government. Charles Town has a large number of residents who commute. These typically higher earners may choose to leave the area because of the presence of the industry that this zoning change would provide for. This will cause a hardship on our economy and municipality. In this way, the industry this zoning will provide for will adversely affect the welfare of our community.

The industry that this zoning will allow will cause stress for multiple reasons on the Charles Town wastewater treatment systems and the surface waterways in Jefferson County and

beyond. The industry currently planning to utilize the zoning change will have discharge to the wastewater system that is high in chloride, primarily from its water softening system. The NPDES permit modification allows up to 5,000 mg/L. Chloride is not settled or removed at the wastewater treatment plant. It cannot be removed by conventional means and would be prohibitively expensive to do by new technology. This is of concern to Charles Town because chloride can harm stream water and also impair functioning of the wastewater treatment plant. Furthermore, the corrosive nature of chloride can cause damage to pipes both in the wastewater system and those used by downstream drinking water systems, like the \$207 million Trap Rock Water Treatment plant in Loudoun.

The human health criteria for chloride under WV standards is 250 mg/L. Under low stream flow conditions, chloride additions to the treatment plant effluent, as proposed by the industry currently planning to utilize the zoning change, could cause chloride levels in Evitts Run to exceed this standard. If the amount of chloride increased due to expansion or higher throughput, then this human health standard would be violated frequently. Chlorides are also known to harm aquatic life and effect metal toxicity in rivers. The USEPA and several states have surface water guidelines of 230mg/L for chronic exposure. This would also pose a risk of damaging the water treatment facilities downstream on the Potomac River.

A research study by Lefebvre and Moletta in 2006 showed that chloride and salinity impair the ability of wastewater treatment to remove phosphorus and nitrogen, and because of this, other states have introduced legislation to treat saline wastewater. Uygur and Kargi in 2004 looked at the effects of salt on synthetic wastewater treatment. They found that removal of both nitrogen and phosphorus was reduced when salinity increased from 0 to 6%. In fact, the removal efficiency of ammonia dropped from 96% to 39% with this increasing salinity. Hong et al. In 2016 found phosphorous removal decreased 20-28% when chloride concentrations went from 150 mg/L to 1,500 mg/L. Phosphorous removal was completely inhibited at concentrations greater than 2,500 mg/L. This increased salinity has the potential to make the Charles Town wastewater treatment system work far less efficiently.

In addition to the contents of the wastewater this type of industry will produce, the volume of sewage is itself a concern. Given that the City of Charles Town has been in violation of its permit on numerous occasions for spills and overflow of untreated sewage, adding large volumes of wastewater will further challenge the near capacity system. This will mean that costly capacity upgrades will need to be done likely sooner than they would have needed to be done, imposing further financial strain on the system. Through these effects, the industry this zoning will provide for will adversely effect the health, safety, and welfare of the community.

This zoning change will provide for industry the likes of which are not present in this county and have not been present in this county for many decades. We find it appalling that the introduction of zoning for such industry is being done in an area of the county that is historically underserved and lower income. It is even more egregious because the worst effects including air pollution and groundwater contamination will be felt first and most severely in the immediate vicinity, and Ranson does not even have residents in the immediate vicinity of the

proposed zoning change. This decision is being contemplated without representation of those who will be most affected. This would be a deplorable example of environmental injustice.

This zoning will provide for industry that will harm our economy, drive away residents, challenge and or damage our infrastructure, and may damage our waterways and wild life. Through these effects, the industry this zoning would allow will adversely effect the health, safety, and welfare of our community. This is being done with out representation of those it will affect the most. Please vote No on Ordinance #2017-302.

Sincerely,

Christina Melocik

This will make it harder for our small businesses to be successful. In this way, the industry this zoning will provide for will adversely affect the welfare of our community.

According to the 2018 WVU economic study of the eastern panhandle, over 40% of the workforce in Jefferson County choose to work outside of the state. These commuters bring that money home and spend it here supporting our local small businesses, economy and government. Charles Town has a large number of residents who commute. These typically higher earners may choose to leave the area because of the presence of the industry that this zoning change would provide for. This will cause a hardship on our economy and municipality. In this way, the industry this zoning will provide for will adversely affect the welfare of our community.

The industry that this zoning will allow will cause stress for multiple reasons on the Charles Town wastewater treatment systems and the surface waterways in Jefferson County and

beyond. The industry currently planning to utilize the zoning change will have discharge to the wastewater system that is high in chloride, primarily from its water softening system. The NPDES permit modification allows up to 5,000 mg/L. Chloride is not settled or removed at the wastewater treatment plant. It cannot be removed by conventional means and would be prohibitively expensive to do by new technology. This is of concern to Charles Town because chloride can harm stream water and also impair functioning of the wastewater treatment plant. Furthermore, the corrosive nature of chloride can cause damage to pipes both in the wastewater system and those used by downstream drinking water systems, like the \$207 million Trap Rock Water Treatment plant in Loudoun.

The human health criteria for chloride under WV standards is 250 mg/L. Under low stream flow conditions, chloride additions to the treatment plant effluent, as proposed by the industry currently planning to utilize the zoning change, could cause chloride levels in Evitts Run to exceed this standard. If the amount of chloride increased due to expansion or higher throughput, then this human health standard would be violated frequently. Chlorides are also known to harm aquatic life and effect metal toxicity in rivers. The USEPA and several states have surface water guidelines of 230mg/L for chronic exposure. This would also pose a risk of damaging the water treatment facilities downstream on the Potomac River.

A research study by Lefebvre and Moletta in 2006 showed that chloride and salinity impair the ability of wastewater treatment to remove phosphorus and nitrogen, and because of this, other states have introduced legislation to treat saline wastewater. Uygur and Kargi in 2004 looked at the effects of salt on synthetic wastewater treatment. They found that removal of both nitrogen and phosphorus was reduced when salinity increased from 0 to 6%. In fact, the removal efficiency of ammonia dropped from 96% to 39% with this increasing salinity. Hong et al. In 2016 found phosphorous removal decreased 20-28% when chloride concentrations went from 150 mg/L to 1,500 mg/L. Phosphorous removal was completely inhibited at concentrations greater than 2,500 mg/L. This increased salinity has the potential to make the Charles Town wastewater treatment system work far less efficiently.

In addition to the contents of the wastewater this type of industry will produce, the volume of sewage is itself a concern. Given that the City of Charles Town has been in violation of its permit on numerous occasions for spills and overflow of untreated sewage, adding large volumes of wastewater will further challenge the near capacity system. This will mean that costly capacity upgrades will need to be done likely sooner than they would have needed to be done, imposing further financial strain on the system. Through these effects, the industry this zoning will provide for will adversely effect the health, safety, and welfare of the community.

This zoning change will provide for industry the likes of which are not present in this county and have not been present in this county for many decades. We find it appalling that the introduction of zoning for such industry is being done in an area of the county that is historically underserved and lower income. It is even more egregious because the worst effects including air pollution and groundwater contamination will be felt first and most severely in the immediate vicinity, and Ranson does not even have residents in the immediate vicinity of the

proposed zoning change. This decision is being contemplated without representation of those who will be most affected. This would be a deplorable example of environmental injustice.

This zoning will provide for industry that will harm our economy, drive away residents, challenge and or damage our infrastructure, and may damage our waterways and wild life. Through these effects, the industry this zoning would allow will adversely effect the health, safety, and welfare of our community. This is being done with out representation of those it will affect the most. Please vote No on Ordinance #2017-302.

I know people that will move away from Charles town should Rockwool come to pass. It would be such a negative to our beautiful city and surrounding area.

Sincerely,
June Patton

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Jane chang

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask you to vote NO on Ordinance #2017-302. The industry this zoning change will allow for endangers the health, safety and, welfare of the community, and violates the premise of the smart code zoning that we have spent so much time, effort and federal money employing.

Any change in zoning needs to align with the comprehensive plan. In Ranson's current comprehensive plan (2012), the city only refers to "heavy industry" in the history section. Here it is characterized as part of a bygone era that has been replaced by an emphasis on agriculture for local food production, open spaces, and quality-of-life. In the remainder of the document, the word industry is used loosely to describe businesses including flower shops and shoe stores. Nothing that resembles the industry that this zoning change will provide for is described in the current comprehensive plan of Ranson.

In the land use section of the comprehensive plan, number ten states:

"Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The comprehensive plan clearly states that the city will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community. This change in zoning clearly negatively affects the health, safety, and welfare of the community.

As the zoning is proposed, the industry that this zoning change will allow for will be directly across the street from houses, parks and other small businesses. A densely populated subdivision and an elementary school already exit directly across the street. While these latter

community sections are not in the city limits, the effect of this zoning on them should still be considered just the same as it would be if they were in the city limits.

The industry that this zoning change will provide for will produce particulate, gaseous, and hazardous air emissions. These emissions have been shown to be detrimental to human health at every stage of life from embryo to old age. In utero and childhood exposure are the most damaging with lasting effects being realized through out life, and with maternal exposure the effects can be felt for generations. Multiple organ systems are affected including respiratory, cardiovascular, neurologic, immune, and endocrine causing defects in multiple processes including in utero development, neurodevelopment, immune and tolerance development, and cognitive defects. There are also psychological, social, and economic effects from both perceived and actual air pollution in both children and adults. Many of these effects can be seen even with short-term exposure or exposure that is lower than the levels recommended by the US Environmental Protection Agency and World Health Organization. These consequences are devastating to the individual and depressing to the local community and economy. State law does not allow a school to be built next to industry that this zoning will allow but yet we are contemplating changing the zoning so this industry can build next to a school. This does not make sense. As Ranson residents, we want Ranson to follow the lead of the state and keep polluting industry away from kids. In these ways, this change in zoning will negatively affect the health and welfare of the community.

In addition to the health effects of the air emissions is the threat to groundwater from the industry that this zoning change would allow. The land in question has karst hydrogeology and therefore very high aquifer vulnerability and is not appropriate for this industry. With the type of industry this zoning will provide for, combined with high aquifer vulnerability, the likelihood of groundwater contamination is too high for the community and region to bear. A USGS study demonstrated that contamination in the groundwater adjacent to the site moves relatively quickly and can be found in wells and surface water structures in a variety of locations in the County. In this way, contamination at the site would affect the drinking water of the great majority of Jefferson County residents. Through the surface water connections, the water at the site also affects the water resources of the region.

Aquifer vulnerability has been used by policy makers for decades to set land use regulations. The guiding document, from the WVDEP, Stormwater Management Design in Karst Areas states, "it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." In Ranson, we need to follow this advice and not change the zoning of this land for use by industry that has among the highest aquifer vulnerability in the County. This zoning change will endanger the safety of the community and region by endangering the safe water resources. As Ranson residents, we want to safeguard the water resources of the county and region by following the WVDEP guidance here.

Further, by reallocating this transect district and replacing it with a monolithic block of Special District Industrial designation, hundreds of housing units, parks and space for small businesses are lost. Ranson loses the potential for property tax on these properties and their improvements, Business and Occupational tax on the businesses and sales tax in retail stores. The community loses out on the opportunity to develop affordable housing and create locations where people can live, work, play, and shop all in the same place reducing the need for travel.

Worse yet apparently a deal has been made where the entity that owns the subject land has required that a litany of things not be built on the adjacent land essentially stripping the purpose of the smart code transect zone that exists there. Transect zones in the smart code are meant to transition, from out to in, and provide communities where people can safely work and live in close proximity in an effort to reduce travel. Excluding many of the components of the transect zone effectively eliminates the features that make it a transect zone, thus, losing the benefits a transect zone offers the community and city. By losing these benefits, reducing the overall and affordable housing prospects, and reducing so drastically the opportunities for city income, this zoning change will negatively affect the welfare of the community.

As Ranson residents, we find it odd that we are changing zoning to provide for industry that we would not put in the middle of our town close to our residents, but we are placing it close to the homes of county residents. Further, it is striking that the area where this change in zoning is directly adjacent to historically underserved lower income communities and a Title I school. This amounts to environmental injustice and cannot be tolerated.

The purpose of zoning is for a city to protect the health, welfare, morals and safety of the community. In this case, the air emissions and heavy truck traffic will endanger the communities' health. The threat of water contamination will endanger the safety of the community. The effect of lost productivity and decreased workforce participation due to increased illness and the negative effect the air emissions and presence of such a factory will have on the local economy will negatively affect the welfare of the community. The environmental injustice of changing the zoning to accommodate such polluting industry in a location where your municipality has no residents, but yet hundreds of low income and underserved county residents live is egregiously amoral. This must not happen. We respectfully implore you to do the right thing and vote no on ordinance #2017-302.

Sincerely,

Gloria Lemus

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask you to vote NO on Ordinance #2017-302. The industry this zoning change will allow for endangers the health, safety and, welfare of the community, and violates the premise of the smart code zoning that we have spent so much time, effort and federal money employing.

This zoning change will provide for industry that will negatively affect the agriculture industry in Jefferson County and beyond. The combination of the air emissions and threat to the ground water resources could have devastating consequences for the agricultural community of Jefferson County.

The comprehensive plan of Ranson is clear: it states, "the City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community." This land is ill-suited for an industrial facility due to its location and hydrogeology. Further, the industry that this zoning change will allow for will adversely affect the health, safety, and welfare of the community through its affect on the agricultural industry.

The agriculture industry in Jefferson County is hundreds of years old and continues to serve our community well today. According to the economic impact study "A Shared Agenda for Growing West Virginia's Agricultural Economy, Prepared by Fourth Economy for West Virginia Department Of Agriculture West Virginia University Extension Service 2012," Jefferson County is the second highest producing county for crops sales, third highest for fruits and vegetables sales, and in the top 9 counties for sales of animals and animal products.

Agriculture, tourism and the equine industries work synergistically to have an outsized positive impact on the economy in Ranson and Jefferson County as a whole. Agriculture drives tourism by creating agro-tourism opportunities, preserving beautiful open spaces that contribute to the

bucolic nature of our county, and providing the locally produced agriculture goods many tourists are look for in our markets and restaurants. Agriculture also supports the equine industry by providing local products like hay and straw, helping maintain pasture land, co-supporting local dual-purpose retail stores, and helping recycle by products. Agriculture helps maintain the way of life that many those who choose to live in Jefferson County enjoy. Industrial manufacturing and industry this zoning will provide for could never achieve these things.

Local agriculture also provides a source of locally produced agricultural goods. It has become apparent with the current pandemic and health emergency. This became a supply chain crisis because as our supply chains have moved to be ever more lean and efficient they lack resiliency and agility. By having a local source of agricultural goods and food we add resiliency and agility into our own economy and community. The agricultural industry in Jefferson County provides this.

A plethora of scientific studies have shown that a variety of air pollutants produced by the type of industry this zoning change would provide for causes decreased yields of both quantity and quality for several of the crops important to Jefferson County including winter wheat and soybeans. Soybeans and wheat are two of the crops significantly affected and two of the most prevalent crops in Jefferson County. Lower crop yields harm the farms and all the members of the down stream supply chain as well as the consumer. In this way, this zoning change will adversely affect the welfare of the community.

Recent studies have shown that even small increases in air pollution affect the productivity of agricultural workers. Similar to the reduction in crop yield this will negatively affect the individual workers, businesses, consumers and industry as a whole. In this way, this zoning change will adversely affect the health and welfare of individuals and the community.

Even more devastating is the possibility of groundwater contamination. The land at the subject location has karst hydrogeology and as such has porous bedrock and severe ground instability problems. The porous bedrock allows rapid diffuse infiltration of surface water into ground water and the severe ground instability problems leads to sinkhole development. Sinkholes provide direct connection of the surface water with the ground water aquifer through point infiltration. In fact, according to a 2012 study by Doctor and Doctor, the subject location and that of Terrapins Neck have the highest sinkhole vulnerability of any sites in Jefferson County. The propensity and easy of diffuse and point infiltration in areas of karst hydrogeology give them very high aquifer vulnerability meaning the aquifer is very vulnerable to contamination. For this reason, this measure has been used for decades by policymakers to set land use regulations. In this way, this zoning change and the industry it will provide for will adversely affect the welfare of the community.

The WVDEP recognizes development in car karst areas puts water resources high-risk for contamination but also recognizes that this is best protected against true local land use and zoning ordinances. WVDEP's guiding document Stormwater Management Design in Karst Areas

states, "it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." This document also references the Chesapeake Bay Stormwater Network karst stormwater guidance document the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed. In which it states "...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." Land use policy in Ranson and zoning need to take aquifer vulnerability into consideration as these agencies and documents suggest.

The Jefferson Orchards Voluntary Remediation Plan application reports that the ground water is only 60 feet from the surface at the site. It is described in the scientific literature that this land is an upland plane with large amounts of water in the epikarst, and contamination of this water effects the whole aquifer including the communications with surface water streams. A USGS study demonstrated that the groundwater adjacent to the site communicates readily with several surface water structures and wells miles away from the site. The effects of contamination at this site would go well beyond Ranson fouling large portions of the ground water and surface water in Jefferson County.

Groundwater contamination at the site would have devastating effects on the Agricultural industry in Jefferson county. For geographic and economic reasons it is simply infeasible for the agricultural industry to rely on utility provided water. Based on the scientific literature the site being considered for rezoning is one of the areas of highest aquifer vulnerability in Jefferson County and is inappropriate for the industry that this zoning change will provide for. This land is clearly ill-suited for industrial use and should not be zoned for it.

By threatening the local agricultural industry, the industry that this zoning will provide for will threaten the health, safety, and welfare of the community, and this land is not well-suited for industrial use. The Comprehensive Plan in Ranson is clear the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Michelle Hurt

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Laura Van Vuuren

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask that you vote no on Ordinance #2017-302. While not in Ranson, the land and homes around the property that is the subject of the zoning change are closer to the property than anyone who currently lives within the city limits of Ranson. This area will be affected sooner and more harshly by the environmental issues that will develop secondary to the inappropriate siting of industry this zoning would allow.

The subject land has been well studied by Drs. Kozar, Doctor and Doctor and described in the scientific literature and USGS reports as having karst hydrology with very high aquifer vulnerability. The karst landscape is a consequence of the presence of soluble bedrock, which consists of limestone in the case of the subject land. In such landscapes water percolates through the ground and dissolves the underlying rock creating a porous network of caverns and throughways. Karst aquifers are known to be "extremely vulnerable to pollution" due to direct connection between the surface water and groundwater through both point (sinkholes) and diffuse (everywhere) infiltration. It is known from the Voluntary Remediation Plan of Jefferson Orchard that the groundwater at the subject site is only 60 feet below the ground. The subject property and much of the property around it are on an upland plain with few surface streams, but great seasonal variability in the water table resulting in numerous esteves and large amounts of water in the epikarst. This water is easily contaminated and this contamination spreads quickly throughout the aquifer. Dye tests performed near the subject site by the USGS have demonstrated this quick moving thorough dispersment in the aquifer in this area. While this contamination goes on to affect springs at the margins of the upland area continuing on in streams that service municipal water sources and the Potomac River, our concerns are far more immediate in both time and distance. Well water is the only water source available in the area of the proposed zoning change and, with the exception of Fox Glen, a majority of this water is supplied by private wells. Therefore, the groundwater aquifer fulfills a critical necessity, fulfilling all needs including human consumption, household uses, and agriculture and

maintenance of livestock and horses in the immediate area around the site. The concern is that if the aquifer becomes contaminated, then the local drinking water will be fouled.

For decades now, policy makers have been using “Aquifer Vulnerability,” to set land use and water resource protection policy. Karst has very high Aquifer Vulnerability. Therefore, this industrial use is not appropriate for this land and it should not be zoned for it. The guiding documents of the WVDEP recognize this. The introduction to the WVDEP document Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.”

The Chesapeake Bay Stormwater Network karst stormwater guidance document the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed, which the WVDEP cites in its own guiding document Stormwater Management Design in Karst Areas, clearly agrees stating:

“First, the effect of land development on karst terrain is complex and hard to predict, and requires professional analysis to reduce the risk of geological hazards, damage to infrastructure and groundwater contamination.” “The working group acknowledges that past approaches to stormwater and land development in karst terrain have been inadequate to safeguard the public and the environment.” “...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” We clearly need stronger comprehensive land use plans and zoning that direct new growth away from karst areas to more appropriate locations. Ordinance #2017-302 is literally the opposite of this.

Further, we cannot rely on the WVDEP to do the job that good local land use guidelines and zoning should do. For example, the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed states that detention and retention ponds are not recommended on karst and categorize them as discouraged. Also, quoting WVDEP’s own karst guidance: “attenuating surface runoff will increase the rate of sinkhole formation and potential groundwater contamination.” Yet the entity currently planning to utilize this zoning change is planning employment of multiple massive retention ponds and attenuating surface runoff completely. This has already been approved by the DEP in two Construction Stormwater General Permit registrations for that company. One of detention ponds is not even regulated by the DEP as it contains process water and has no outlet. Clearly the DEP recognizes the risks but is not appropriately limiting them. Relying on the DEP to protect the public health, safety, welfare, and the environment from any entity in these karst locations is simply as the CNS bulletin said it “inadequate to safeguard the public and the environment.” We must have appropriate zoning that takes into consideration appropriate use of land with karst hydrogeology. Ordinance #2017-302 does not do this, but instead increases the risk to the public and the environment.

A second serious concern is the air emissions from the industry that this zoning will provide for. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. These types of air emissions have been shown to increase the risk of, contribute to, and exacerbate a multitude of developmental, physical, physiological, physiological, cognitive and economic. The exposure of one individual can cause repercussions in multiple generations. Embryos, fetuses, and children are most vulnerable with effects born out over a lifetime, and that of their offspring. Many of these effects only require short-term exposure and some have even been shown to occur at levels below current limits recommended by the World Health Organization. One example of this is that a recent study found that “Even within the limits set by the World Health Organization, the pollutants PM₁₀, SO₂, NO₂, and O₃ are associated with increased risk of treatment for respiratory diseases in children 0 to 6 years of age.” Unfortunately, the US limits are higher than WHO, 300 % higher in the case of PM₁₀!

In fact, in 2019, in the Advice from the Independent Particulate Matter Review Panel (formerly U.S. EPA Clean Air Scientific Advisory Committee Particulate Matter Review Panel) on EPA’s Policy Assessment for the Review of the National Ambient Air Quality Standards for Particulate Matter, it stated that the committee unanimously and unequivocally found that the current primary annual and 24-hour PM_{2.5} National Ambient Air Quality Standards (NAAQS) are not adequate to protect public health. The advice from this 20-member committee, whose scientific disciplines include epidemiology, medicine, toxicology, air quality measurement, air quality modeling, exposure assessment measurement and modeling, risk assessment, statistics, and others, was ignored due presumably to political pressure. Not only are the NAAQS too high in some cases, but due to the measure and mechanism by which they work, they can not replace the safety provided by good land use and zoning regulations, that are meant to do things like keep factories with air emissions and hundreds of heavy trucks away from elementary schools. In fact, there is a state law that prohibits siting a school near a factory. Unfortunately, the reciprocal law does not exist. Clearly, just like with the water resources, we cannot rely on the DEP or the EPA to do the job of what appropriate zoning should do. The whole point of zoning is to keep people safe and provide for their health and welfare. Ordinance #2017-302 puts families and school children directly in harms way.

The air emissions, threat to the groundwater, and the very presence of the industry that this zoning change will allow for will have a serious negative economic effect on those who live and or work closest to the site in question. Productivity and workforce participation will be negatively affected by the health effects of the air emissions. The local agricultural operations will be negatively affected by the air emissions with lower quantity and quality of crop yield and would be devastated if the ground water aquifer were fouled. The equine operations in the area, of which there are several, will be negatively affected by the air emissions as they affect the horses’ health and performance. The mere presence of the industry that will be provided for by this zoning change will cause property values to fall. There will be serious economic consequences for the immediate area around the site in question.

Several of the communities in the immediate area of the site for proposed zoning change are traditionally underserved and have lower economic status. The choice of this location for such a zoning change represents an egregious example of environmental injustice that should not be promulgated or tolerated.

This zoning change will provide for industry that will negatively affect the health safety and welfare of our community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Katie Rakes

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

This land and this location are not appropriate for the industry this zoning change will allow. The hydrogeology of the land combined with such industrial activity risks the safety of our water supply. The air emissions from this industry will negatively impact our physical and mental health, our children's ability to achieve, our ability to make a living, our happiness, and it will do this for generations even after we leave or the pollution stops. It is not lost on us that this zoning change is being made next to our neighborhood and not next to the residents of Ranson, yet Ranson is in control. This is not right. We respectfully ask you to vote NO on ordinance #2017-302.

The land at the site in question is not just ill-suited, but completely inappropriate for the industry this zoning change will allow. This land has karst hydrogeology. As such, the ground itself is very unstable and readily develops sinkholes. This land has been described by a 2012 study to be exceptionally susceptible to sinkhole formation, more so than most of the rest of the county. Sinkholes provide point infiltration of surface water into the water in the epikarst. The porous bedrock allows diffuse infiltration of surface water into the epikarst water. At this site, there is also large amounts of water in the epikarst and it is only 60 feet from the surface. This allows the water at the surface to easily communicate with the water in the epikarst and the groundwater aquifer carrying any surface water contaminants with it.

The industrial activity this zoning change will allow for will cause ample surface water contamination from ground level industrial activities, raw material and waste storage and particulate matter falling to the ground from the air emissions. The industry that is currently planning to utilize this zoning change should be designated a stormwater hotspot just for this reason. The WVDEP should require them to treat all water before it is allowed to infiltrate the ground, but so far, this has not been done. The WVDEP actually recommends that areas like this not be developed due to the risk to groundwater. Their guiding document, *Stormwater Management Design in Karst Areas* states, "it is important to note that the potential for

geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that the best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” This guidance should be followed; clearly we cannot expect the DEP to protect us from inappropriate zoning changes.

The wellhead protection area for the Fox Glen’s well and that of the elementary school where our children go to school intersects with the land where the zoning change is being proposed. However, a USGS study has shown that the groundwater aquifer here moves relatively fast and so contamination throughout this property is a concern for our water quality. This zoning change will clearly endanger the safety of our water supply. If the well at Fox Glen is contaminated and the utility is forced to divert water from further away, this may be used as evidence at the Public Service Commission to raise the water tariff on Fox Glen residents. This is an increase many will not be able to afford, raising the risk of water insecurity.

The air emissions that will be produced by the industry that this zoning will allow include gaseous (SO_2 , NO_2 , O_3 (VOC and NO_x)), particulate matter (PM_{10} , $\text{PM}_{2.5}$, $\text{PM}_{0.1}$), and hazardous emissions (neurotoxins and carcinogens). We will be exposed through our lungs from the air we breathe, through our skin from the air and things we contact, and through contaminated things we may ingest. Our kids will be more exposed because they spend more time playing outside and on the ground and kids like to put things in their mouth. In fact, according to the National Academy of Science, our kids are more at risk because they breathe more air per pound than adults, their detoxification pathways are less mature, they are growing and developing and these processes are more sensitive, and they have more years to live yet and thus more years to develop slow onset diseases. Exposure to air pollution in early human development, especially exposure to fine particulate pollution, can be extremely deleterious to children's health and development.

The negative effects start in utero. Embryonic and fetal cells are exquisitely sensitive and are affected directly by inhaled pollutants that cross the placenta like fine particulate matter as well as other secondary pathways causing impaired organ development, disturbed development of the immune system, premature birth, lower birth weight, and increased infant mortality. These early changes lead to long-term effects including increased disease development in multiple organ systems throughout life, cognitive defects, achievement deficits, and negative psychological social and economic effects.

Fetal and early life exposure to air pollution causes inappropriate brain growth and maturation in early life, neurodevelopmental disorders, early cognitive deficits, and has been associated with autism by several case-control studies. Several studies have demonstrated a scholastic deficit in exposed children for almost all subject matter and at a variety of grade levels. The cause of these findings are multifactorial and researchers suggested they include exacerbation of asthma symptoms, other decreased health parameters, increased fatigue, increased absence, or a direct neurodegenerative effect, all caused by or contributed to by the exposure to air pollution.

Development of the respiratory system starts in utero, is 80% complete by age 6, and continues to early 20s. A review by Korten et. al. in 2017 explained that exposure to air pollution during the first 6 years of life can damage the lung tissue, impair lung growth, and alter the development of immune function and repair mechanisms within the lungs. These effects increase both short- and long-term risk for asthma, chronic obstructive pulmonary disease (COPD), lung cancer, and respiratory infections. Exposure to outdoor air pollution not only increased the risk of these diseases, but exacerbates existing disease increasing severity of symptoms, hospital visits, and death due to these diseases. A 2019 study found “even within the limits set by the World Health Organization, the pollutants PM10, SO2, NO2, and O3 are associated with increased risk of treatment for respiratory diseases in children 0 to 6 years of age.” It is important to note that the US limits are set higher than the WHO, 300% higher in the case of PM10!

There are a multitude of other physiologic effects of air pollution that cause increased rates of morbidity and mortality in both adults and children. Air pollutants are associated with increased risk of autoimmune diseases like asthma, allergies, and eczema. Air pollution has deleterious effects the cardiovascular system, endocrine system and blood, contributing to the occurrence of high blood pressure, high cholesterol, obesity, anemia, and stroke.

There are psychological effects as well. A review, of 178 published articles by Lu published in 2020, systematically examined the psychological (affective, cognitive, behavioral), economic, and social effects of air pollution and found: “Affectively, air pollution decreases happiness and life satisfaction, and increases annoyance, anxiety, mental disorders, self-harm, and suicide. Cognitively, it impairs cognitive functioning and decision making. Behaviorally, air pollution triggers avoidance behavior, defensive expenditure, and migration as coping strategies. Economically, it hurts work productivity and stock markets. Socially, it exacerbates criminal activities and worsens perception of the government. Importantly, both actual and perceived air pollution levels matter.”

Through negative physical and mental health effects air pollution has been shown to decrease an individual’s productivity and ability to participate in the workforce, negatively impacting workforce availability and overall productivity. This negatively impacts individual workers, companies, and the local economy. It also decreases individual’s ability to relocate themselves or their family into an area less affected by pollution. In this way a vicious cycle is set up where successive generations are exposed to the same pollutants and experience the negative effects of the ongoing exposure to pollution. This is not a fate the children of Fox Glen deserve to have thrust upon them by this zoning change and the industry that it will allow into our bucolic county. An editorial in the New England Journal of Medicine, commenting on several recent studies, stated: “The best control strategy from the standpoint of human health, supported by the scientific evidence to date, is to reduce the levels of all types of air pollutants. Our children’s health depends on it.”

The area surrounding the location, of the proposed zoning change that will accommodate heavier types of industry, is historically lower income and underserved. Deciding to locate a tract of such zoning in this location when it is on the whole unwanted and totally inappropriate for the land and surroundings is an example of environmental injustice. The Lancet Commission on Pollution and Health, citing the United Nation's Universal Declaration of 1948 on Human Rights, found that "pollution threatens fundamental human rights - the right to life, the right to health, the right to well-being, and the rights of the child." This rezoning represents not only a bygone era of economic development but a bygone era of environmental injustice and human rights violation.

The Lancet Commission on Pollution and Health further found that prevention of non-communicable diseases will require pollution prevention and that this will require fundamental changes in societal patterns of production, consumption, and transportation. This will require a paradigm shift to a more sustainable economic model based on recognition of human rights. They also found this is a major unexploited opportunity in society that many communities are grappling with undertaking. The movement away from the smart code zoning, with it integrated walkable communities, to large tracts of land dedicated to polluting industry close to a title one school is the exact opposite of this. This rezoning would represent a major step in the wrong direction for disease prevention, human rights, Ranson, and Jefferson County!

This change in zoning is not appropriate for this land and this area. This land itself is not well suited for the industry this zoning change would allow. This industry would severely adversely affect the health, safety and welfare of our community. Please vote NO on the Ordinance #2017-302.

Sincerely,

Fawn Staubs

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Margie Knott

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would negatively affect tourism, economic agility, groundwater quality, and individual health in neighboring municipalities like Shepherdstown. In doing these things the industry that this zoning change provides for will adversely affect the health, safety, and welfare of our community.

Tourism is critically important to Shepherdstown's economy and to the county as a whole. In 2018, tourist spending in the Jefferson County contributed over \$170 million to state and local government revenue and \$213 million in individual earnings. Importantly, most of this money comes from tourists visiting from neighboring states like Virginia, Maryland, and Washington D.C. Out-of-state tourists are largely drawn to Jefferson County because of its reputation for environmental-friendly, sustainable industry. Key elements that support this reputation include the county's pastoral scenery and pristine natural resources. Ordinance #2017-302 will allow industry into Jefferson County that risks harming these elements and dramatically reducing the area's appeal to visitors. The resulting harm to our tourist industry would drive away visitors and decrease state, county, and local revenue. The long-term success of Jefferson County's tourism industry is dependent on local governments making coordinated zoning decisions. Allowing certain types in industry in Ranson will negatively affect tourism in every municipality throughout the county, including Shepherdstown. Voting no on ordinance #2017-302 will protect the foundations of the county's tourism industry and protect the 7,040 jobs in Jefferson County that are directly supported by tourism. In this way, the industry this zoning change will allow will adversely affect the welfare of our community.

The type of large, consolidated industry that ordinance #2017-302 would allow in Ranson would generally reduce the flexibility of local economies in Jefferson County. Historically, the driving industries in Jefferson County have been tourism, agriculture, and the equine industries. These three industries are large conglomerates of small businesses. Small business is very important

to Shepherdstown. Small businesses have been shown to create more jobs, cultivate more innovation, and provide more opportunities than big, non-local firms. Additionally, small businesses have been shown to be more reactive to sudden changes relative to manufacturing businesses. Bringing large, manufacturing-based industry into Jefferson county will depress the local economy and stifle innovation. During this time of economic upheaval and uncertainty, Jefferson County needs to support industries that will allow local economies to adapt and recover as fast as possible.

Voting no on ordinance #2017-302 will help protect water resources throughout Jefferson County. The type of industry that ordinance #2017-302 would allow puts the ground resources of Jefferson county at significant risk due to the karst hydrogeology. The site in Ranson is in the Rocky Marsh Run watershed, which is in the source water protection zone for Shepherdstown and drains to the Potomac River. Therefore, activity at this site will affect both groundwater and surface water streams. In municipalities like Shepherdstown, many residents and nearby farms depend on wells for water. Contamination of groundwater aquifers would create both health and remediation concerns for local residents. Dye tests performed by the USGS near the area of proposed rezoning in Ranson have shown just how far-reaching groundwater contamination at the Ranson site could be. Results from the USGS study revealed measurable dye concentrations in Elk's Run, Rattlesnake Run, and even the Shepherdstown Town Run. This last run cuts through the center of Shepherdstown and is a favorite area for children to play and learn to fish. In this way, the industry that this zoning change will allow will adversely affect the safety of our community.

Groundwater pollution is not the only concern for communities like Shepherdstown. The type of industry that ordinance #2017-302 would allow in Ranson would also generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. These pollutants are particularly harmful to children. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. The site in Ranson is across the road from an elementary school and also within the Jefferson High Middle district. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of children in Shepherdstown and all of Jefferson County. In this way, the industry that this zoning change will provide for will adversely affect the health of our community.

I again request that you vote no on ordinance #2017-302. This zoning change will allow industry that will adversely affect the health, safety, and welfare of our community. The long-term economic, environmental, and community health of municipalities like Shepherdstown depend on Ranson's participation in a coordinated zoning plan for all of Jefferson County.

Sincerely,

Jeffrey Wilson

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote NO on Ordinance #2017-302. This rezoning will put an undue hardship on the wastewater treatment systems, burden the rate payers and risk surface waterways in Charles Town, risking the health, safety and welfare of the community. The comprehensive plan of Ranson states, the City "will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community." Therefore, please vote NO on #2017-302.

The nature of the industry that this zoning will allow will be harmful to our local economy. Charles Town has spent a lot of time and money improving our downtown area for restaurants and retail. We are working to take advantage of the tourism industry in our county and bring more people into Charles Town. The eye sore, noise pollution, air pollution, and obvious move away from sustainability will drive people away from Jefferson County and Charles Town, rendering our efforts ineffective and unrewarding. This will make it harder for our small businesses to be successful. In this way, the industry this zoning will provide for will adversely affect the welfare of our community.

According to the 2018 WVU economic study of the eastern panhandle, over 40% of the workforce in Jefferson County choose to work outside of the state. These commuters bring that money home and spend it here supporting our local small businesses, economy and government. Charles Town has a large number of residents who commute. These typically higher earners may choose to leave the area because of the presence of the industry that this zoning change would provide for. This will cause a hardship on our economy and municipality. In this way, the industry this zoning will provide for will adversely affect the welfare of our community.

The industry that this zoning will allow will cause stress for multiple reasons on the Charles Town wastewater treatment systems and the surface waterways in Jefferson County and

beyond. The industry currently planning to utilize the zoning change will have discharge to the wastewater system that is high in chloride, primarily from its water softening system. The NPDES permit modification allows up to 5,000 mg/L. Chloride is not settled or removed at the wastewater treatment plant. It cannot be removed by conventional means and would be prohibitively expensive to do by new technology. This is of concern to Charles Town because chloride can harm stream water and also impair functioning of the wastewater treatment plant. Furthermore, the corrosive nature of chloride can cause damage to pipes both in the wastewater system and those used by downstream drinking water systems, like the \$207 million Trap Rock Water Treatment plant in Loudoun.

The human health criteria for chloride under WV standards is 250 mg/L. Under low stream flow conditions, chloride additions to the treatment plant effluent, as proposed by the industry currently planning to utilize the zoning change, could cause chloride levels in Evitts Run to exceed this standard. If the amount of chloride increased due to expansion or higher throughput, then this human health standard would be violated frequently. Chlorides are also known to harm aquatic life and effect metal toxicity in rivers. The USEPA and several states have surface water guidelines of 230mg/L for chronic exposure. This would also pose a risk of damaging the water treatment facilities downstream on the Potomac River.

A research study by Lefebvre and Moletta in 2006 showed that chloride and salinity impair the ability of wastewater treatment to remove phosphorus and nitrogen, and because of this, other states have introduced legislation to treat saline wastewater. Uygur and Kargi in 2004 looked at the effects of salt on synthetic wastewater treatment. They found that removal of both nitrogen and phosphorus was reduced when salinity increased from 0 to 6%. In fact, the removal efficiency of ammonia dropped from 96% to 39% with this increasing salinity. Hong et al. In 2016 found phosphorous removal decreased 20-28% when chloride concentrations went from 150 mg/L to 1,500 mg/L. Phosphorous removal was completely inhibited at concentrations greater than 2,500 mg/L. This increased salinity has the potential to make the Charles Town wastewater treatment system work far less efficiently.

In addition to the contents of the wastewater this type of industry will produce, the volume of sewage is itself a concern. Given that the City of Charles Town has been in violation of its permit on numerous occasions for spills and overflow of untreated sewage, adding large volumes of wastewater will further challenge the near capacity system. This will mean that costly capacity upgrades will need to be done likely sooner than they would have needed to be done, imposing further financial strain on the system. Through these effects, the industry this zoning will provide for will adversely effect the health, safety, and welfare of the community.

This zoning change will provide for industry the likes of which are not present in this county and have not been present in this county for many decades. We find it appalling that the introduction of zoning for such industry is being done in an area of the county that is historically underserved and lower income. It is even more egregious because the worst effects including air pollution and groundwater contamination will be felt first and most severely in the immediate vicinity, and Ranson does not even have residents in the immediate vicinity of the

proposed zoning change. This decision is being contemplated without representation of those who will be most affected. This would be a deplorable example of environmental injustice.

This zoning will provide for industry that will harm our economy, drive away residents, challenge and or damage our infrastructure, and may damage our waterways and wild life. Through these effects, the industry this zoning would allow will adversely effect the health, safety, and welfare of our community. This is being done with out representation of those it will affect the most. Please vote No on Ordinance #2017-302.

MY FAMILY HAS LIVED here 100 years. Don't mess up our town now!

Sincerely,

Louis Garvin

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Doreen Voigt

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

I am fearful for the health of the community because of the ease in which our water supply can be polluted due to the karst terrain. This difference in our terrain is important and we will hold those people who pollute it accountable. Thank you

Thank you,

Harriet Mandy"" Staffa

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask that you vote no on Ordinance #2017-302. While not in Ranson, the land and homes around the property that is the subject of the zoning change are closer to the property than anyone who currently lives within the city limits of Ranson. This area will be affected sooner and more harshly by the environmental issues that will develop secondary to the inappropriate siting of industry this zoning would allow.

The subject land has been well studied by Drs. Kozar, Doctor and Doctor and described in the scientific literature and USGS reports as having karst hydrology with very high aquifer vulnerability. The karst landscape is a consequence of the presence of soluble bedrock, which consists of limestone in the case of the subject land. In such landscapes water percolates through the ground and dissolves the underlying rock creating a porous network of caverns and throughways. Karst aquifers are known to be "extremely vulnerable to pollution" due to direct connection between the surface water and groundwater through both point (sinkholes) and diffuse (everywhere) infiltration. It is known from the Voluntary Remediation Plan of Jefferson Orchard that the groundwater at the subject site is only 60 feet below the ground. The subject property and much of the property around it are on an upland plain with few surface streams, but great seasonal variability in the water table resulting in numerous esteves and large amounts of water in the epikarst. This water is easily contaminated and this contamination spreads quickly throughout the aquifer. Dye tests performed near the subject site by the USGS have demonstrated this quick moving thorough dispersment in the aquifer in this area. While this contamination goes on to affect springs at the margins of the upland area continuing on in streams that service municipal water sources and the Potomac River, our concerns are far more immediate in both time and distance. Well water is the only water source available in the area of the proposed zoning change and, with the exception of Fox Glen, a majority of this water is supplied by private wells. Therefore, the groundwater aquifer fulfills a critical necessity, fulfilling all needs including human consumption, household uses, and agriculture and

maintenance of livestock and horses in the immediate area around the site. The concern is that if the aquifer becomes contaminated, then the local drinking water will be fouled.

For decades now, policy makers have been using “Aquifer Vulnerability,” to set land use and water resource protection policy. Karst has very high Aquifer Vulnerability. Therefore, this industrial use is not appropriate for this land and it should not be zoned for it. The guiding documents of the WVDEP recognize this. The introduction to the WVDEP document Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.”

The Chesapeake Bay Stormwater Network karst stormwater guidance document the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed, which the WVDEP cites in its own guiding document Stormwater Management Design in Karst Areas, clearly agrees stating:

“First, the effect of land development on karst terrain is complex and hard to predict, and requires professional analysis to reduce the risk of geological hazards, damage to infrastructure and groundwater contamination.” “The working group acknowledges that past approaches to stormwater and land development in karst terrain have been inadequate to safeguard the public and the environment.” “...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” We clearly need stronger comprehensive land use plans and zoning that direct new growth away from karst areas to more appropriate locations. Ordinance #2017-302 is literally the opposite of this.

Further, we cannot rely on the WVDEP to do the job that good local land use guidelines and zoning should do. For example, the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed states that detention and retention ponds are not recommended on karst and categorize them as discouraged. Also, quoting WVDEP’s own karst guidance: “attenuating surface runoff will increase the rate of sinkhole formation and potential groundwater contamination.” Yet the entity currently planning to utilize this zoning change is planning employment of multiple massive retention ponds and attenuating surface runoff completely. This has already been approved by the DEP in two Construction Stormwater General Permit registrations for that company. One of detention ponds is not even regulated by the DEP as it contains process water and has no outlet. Clearly the DEP recognizes the risks but is not appropriately limiting them. Relying on the DEP to protect the public health, safety, welfare, and the environment from any entity in these karst locations is simply as the CNS bulletin said it “inadequate to safeguard the public and the environment.” We must have appropriate zoning that takes into consideration appropriate use of land with karst hydrogeology. Ordinance #2017-302 does not do this, but instead increases the risk to the public and the environment.

A second serious concern is the air emissions from the industry that this zoning will provide for. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. These types of air emissions have been shown to increase the risk of, contribute to, and exacerbate a multitude of developmental, physical, physiological, physiological, cognitive and economic. The exposure of one individual can cause repercussions in multiple generations. Embryos, fetuses, and children are most vulnerable with effects born out over a lifetime, and that of their offspring. Many of these effects only require short-term exposure and some have even been shown to occur at levels below current limits recommended by the World Health Organization. One example of this is that a recent study found that “Even within the limits set by the World Health Organization, the pollutants PM₁₀, SO₂, NO₂, and O₃ are associated with increased risk of treatment for respiratory diseases in children 0 to 6 years of age.” Unfortunately, the US limits are higher than WHO, 300 % higher in the case of PM₁₀!

In fact, in 2019, in the Advice from the Independent Particulate Matter Review Panel (formerly U.S. EPA Clean Air Scientific Advisory Committee Particulate Matter Review Panel) on EPA’s Policy Assessment for the Review of the National Ambient Air Quality Standards for Particulate Matter, it stated that the committee unanimously and unequivocally found that the current primary annual and 24-hour PM_{2.5} National Ambient Air Quality Standards (NAAQS) are not adequate to protect public health. The advice from this 20-member committee, whose scientific disciplines include epidemiology, medicine, toxicology, air quality measurement, air quality modeling, exposure assessment measurement and modeling, risk assessment, statistics, and others, was ignored due presumably to political pressure. Not only are the NAAQS too high in some cases, but due to the measure and mechanism by which they work, they can not replace the safety provided by good land use and zoning regulations, that are meant to do things like keep factories with air emissions and hundreds of heavy trucks away from elementary schools. In fact, there is a state law that prohibits siting a school near a factory. Unfortunately, the reciprocal law does not exist. Clearly, just like with the water resources, we cannot rely on the DEP or the EPA to do the job of what appropriate zoning should do. The whole point of zoning is to keep people safe and provide for their health and welfare. Ordinance #2017-302 puts families and school children directly in harms way.

The air emissions, threat to the groundwater, and the very presence of the industry that this zoning change will allow for will have a serious negative economic effect on those who live and or work closest to the site in question. Productivity and workforce participation will be negatively affected by the health effects of the air emissions. The local agricultural operations will be negatively affected by the air emissions with lower quantity and quality of crop yield and would be devastated if the ground water aquifer were fouled. The equine operations in the area, of which there are several, will be negatively affected by the air emissions as they affect the horses’ health and performance. The mere presence of the industry that will be provided for by this zoning change will cause property values to fall. There will be serious economic consequences for the immediate area around the site in question.

Several of the communities in the immediate area of the site for proposed zoning change are traditionally underserved and have lower economic status. The choice of this location for such a zoning change represents an egregious example of environmental injustice that should not be promulgated or tolerated.

This zoning change will provide for industry that will negatively affect the health safety and welfare of our community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Rachel Hauck-Oldham

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Carmen Bermudez

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

This is my home. I don't live in Ranson. I live in Kearneysville. This was never Ranson's land. Ranson stole this land to sell our county out to a garbage foreign company. It is shoddy back-door deals like this that have destroyed our state since it's conception. For years it was the coal companies. Then it was natural gas. Now one small town's moronic leaders have single-handedly and illegally taken action to make the wealthiest county in the state ugly. Great job.

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask that you vote no on Ordinance #2017-302. The concern is that if the aquifer becomes contaminated, then the local drinking water will be fouled.

For decades now, policy makers have been using “Aquifer Vulnerability,” to set land use and water resource protection policy. Karst has very high Aquifer Vulnerability. Therefore, this industrial use is not appropriate for this land and it should not be zoned for it. The guiding documents of the WVDEP recognize this. The introduction to the WVDEP document Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.”

The Chesapeake Bay Stormwater Network karst stormwater guidance document the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed, which the WVDEP cites in its own guiding document Stormwater Management Design in Karst Areas, clearly agrees stating:

“First, the effect of land development on karst terrain is complex and hard to predict, and requires professional analysis to reduce the risk of geological hazards, damage to infrastructure and groundwater contamination.” “The working group acknowledges that past approaches to stormwater and land development in karst terrain have been inadequate to safeguard the public and the environment.” “...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” We clearly need stronger comprehensive land use plans and zoning that direct new growth away from karst areas to more appropriate locations. Ordinance #2017-302 is literally the opposite of this.

Further, we cannot rely on the WVDEP to do the job that good local land use guidelines and zoning should do. For example, the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed states that detention and retention ponds are not recommended on karst and categorize them as discouraged. Also, quoting WVDEP’s own karst guidance: “attenuating surface runoff will increase the rate of sinkhole formation and potential groundwater contamination.” Yet the entity currently planning to utilize this zoning change is planning employment of multiple massive retention ponds and attenuating surface runoff completely. This has already been approved by the DEP in two Construction Stormwater General Permit registrations for that company. One of detention ponds is not even regulated by the DEP as it contains process water and has no outlet. Clearly the DEP recognizes the risks but

is not appropriately limiting them. Relying on the DEP to protect the public health, safety, welfare, and the environment from any entity in these karst locations is simply as the CNS bulletin said it “inadequate to safeguard the public and the environment.” We must have appropriate zoning that takes into consideration appropriate use of land with karst hydrogeology. Ordinance #2017-302 does not do this, but instead increases the risk to the public and the environment.

A second serious concern is the air emissions from the industry that this zoning will provide for. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. These types of air emissions have been shown to increase the risk of, contribute to, and exacerbate a multitude of developmental, physical, physiological, physiological, cognitive and economic. The exposure of one individual can cause repercussions in multiple generations. Embryos, fetuses, and children are most vulnerable with effects born out over a lifetime, and that of their offspring. Many of these effects only require short-term exposure and some have even been shown to occur at levels below current limits recommended by the World Health Organization. One example of this is that a recent study found that “Even within the limits set by the World Health Organization, the pollutants PM₁₀, SO₂, NO₂, and O₃ are associated with increased risk of treatment for respiratory diseases in children 0 to 6 years of age.” Unfortunately, the US limits are higher than WHO, 300 % higher in the case of PM₁₀!

In fact, in 2019, in the Advice from the Independent Particulate Matter Review Panel (formerly U.S. EPA Clean Air Scientific Advisory Committee Particulate Matter Review Panel) on EPA’s Policy Assessment for the Review of the National Ambient Air Quality Standards for Particulate Matter, it stated that the committee unanimously and unequivocally found that the current primary annual and 24-hour PM_{2.5} National Ambient Air Quality Standards (NAAQS) are not adequate to protect public health. The advice from this 20-member committee, whose scientific disciplines include epidemiology, medicine, toxicology, air quality measurement, air quality modeling, exposure assessment measurement and modeling, risk assessment, statistics, and others, was ignored due presumably to political pressure. Not only are the NAAQS too high in some cases, but due to the measure and mechanism by which they work, they can not replace the safety provided by good land use and zoning regulations, that are meant to do things like keep factories with air emissions and hundreds of heavy trucks away from elementary schools. In fact, there is a state law that prohibits siting a school near a factory. Unfortunately, the reciprocal law does not exist. Clearly, just like with the water resources, we cannot rely on the DEP or the EPA to do the job of what appropriate zoning should do. The whole point of zoning is to keep people safe and provide for their health and welfare. Ordinance #2017-302 puts families and school children directly in harms way.

The air emissions, threat to the groundwater, and the very presence of the industry that this zoning change will allow for will have a serious negative economic effect on those who live and or work closest to the site in question. Productivity and workforce participation will be negatively affected by the health effects of the air emissions. The local agricultural operations will be negatively affected by the air emissions with lower quantity and quality of crop yield and

would be devastated if the ground water aquifer were fouled. The equine operations in the area, of which there are several, will be negatively affected by the air emissions as they affect the horses' health and performance. The mere presence of the industry that will be provided for by this zoning change will cause property values to fall. There will be serious economic consequences for the immediate area around the site in question.

Several of the communities in the immediate area of the site for proposed zoning change are traditionally underserved and have lower economic status. The choice of this location for such a zoning change represents an egregious example of environmental injustice that should not be promulgated or tolerated.

This zoning change will provide for industry that will negatively affect the health safety and welfare of our community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Corey Walsh

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would negatively affect tourism, economic agility, groundwater quality, and individual health in neighboring municipalities like Shepherdstown. In doing these things the industry that this zoning change provides for will adversely affect the health, safety, and welfare of our community.

Tourism is critically important to Shepherdstown's economy and to the county as a whole. In 2018, tourist spending in the Jefferson County contributed over \$170 million to state and local government revenue and \$213 million in individual earnings. Importantly, most of this money comes from tourists visiting from neighboring states like Virginia, Maryland, and Washington D.C. Out-of-state tourists are largely drawn to Jefferson County because of its reputation for environmental-friendly, sustainable industry. Key elements that support this reputation include the county's pastoral scenery and pristine natural resources. Ordinance #2017-302 will allow industry into Jefferson County that risks harming these elements and dramatically reducing the area's appeal to visitors. The resulting harm to our tourist industry would drive away visitors and decrease state, county, and local revenue. The long-term success of Jefferson County's tourism industry is dependent on local governments making coordinated zoning decisions. Allowing certain types in industry in Ranson will negatively affect tourism in every municipality throughout the county, including Shepherdstown. Voting no on ordinance #2017-302 will protect the foundations of the county's tourism industry and protect the 7,040 jobs in Jefferson County that are directly supported by tourism. In this way, the industry this zoning change will allow will adversely affect the welfare of our community.

The type of large, consolidated industry that ordinance #2017-302 would allow in Ranson would generally reduce the flexibility of local economies in Jefferson County. Historically, the driving industries in Jefferson County have been tourism, agriculture, and the equine industries. These three industries are large conglomerates of small businesses. Small business is very important

to Shepherdstown. Small businesses have been shown to create more jobs, cultivate more innovation, and provide more opportunities than big, non-local firms. Additionally, small businesses have been shown to be more reactive to sudden changes relative to manufacturing businesses. Bringing large, manufacturing-based industry into Jefferson county will depress the local economy and stifle innovation. During this time of economic upheaval and uncertainty, Jefferson County needs to support industries that will allow local economies to adapt and recover as fast as possible.

Voting no on ordinance #2017-302 will help protect water resources throughout Jefferson County. The type of industry that ordinance #2017-302 would allow puts the ground resources of Jefferson county at significant risk due to the karst hydrogeology. The site in Ranson is in the Rocky Marsh Run watershed, which is in the source water protection zone for Shepherdstown and drains to the Potomac River. Therefore, activity at this site will affect both groundwater and surface water streams. In municipalities like Shepherdstown, many residents and nearby farms depend on wells for water. Contamination of groundwater aquifers would create both health and remediation concerns for local residents. Dye tests performed by the USGS near the area of proposed rezoning in Ranson have shown just how far-reaching groundwater contamination at the Ranson site could be. Results from the USGS study revealed measurable dye concentrations in Elk's Run, Rattlesnake Run, and even the Shepherdstown Town Run. This last run cuts through the center of Shepherdstown and is a favorite area for children to play and learn to fish. In this way, the industry that this zoning change will allow will adversely affect the safety of our community.

Groundwater pollution is not the only concern for communities like Shepherdstown. The type of industry that ordinance #2017-302 would allow in Ranson would also generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. These pollutants are particularly harmful to children. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. The site in Ranson is across the road from an elementary school and also within the Jefferson High Middle district. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of children in Shepherdstown and all of Jefferson County. In this way, the industry that this zoning change will provide for will adversely affect the health of our community.

I again request that you vote no on ordinance #2017-302. This zoning change will allow industry that will adversely affect the health, safety, and welfare of our community. The long-term economic, environmental, and community health of municipalities like Shepherdstown depend on Ranson's participation in a coordinated zoning plan for all of Jefferson County.

Sincerely,

AnnaMary Walsh

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask that you vote no on Ordinance #2017-302. While not in Ranson, the land and homes around the property that is the subject of the zoning change are closer to the property than anyone who currently lives within the city limits of Ranson. This area will be affected sooner and more harshly by the environmental issues that will develop secondary to the inappropriate siting of industry this zoning would allow.

The subject land has been well studied by Drs. Kozar, Doctor and Doctor and described in the scientific literature and USGS reports as having karst hydrology with very high aquifer vulnerability. The karst landscape is a consequence of the presence of soluble bedrock, which consists of limestone in the case of the subject land. In such landscapes water percolates through the ground and dissolves the underlying rock creating a porous network of caverns and throughways. Karst aquifers are known to be "extremely vulnerable to pollution" due to direct connection between the surface water and groundwater through both point (sinkholes) and diffuse (everywhere) infiltration. It is known from the Voluntary Remediation Plan of Jefferson Orchard that the groundwater at the subject site is only 60 feet below the ground. The subject property and much of the property around it are on an upland plain with few surface streams, but great seasonal variability in the water table resulting in numerous esteves and large amounts of water in the epikarst. This water is easily contaminated and this contamination spreads quickly throughout the aquifer. Dye tests performed near the subject site by the USGS have demonstrated this quick moving thorough dispersment in the aquifer in this area. While this contamination goes on to affect springs at the margins of the upland area continuing on in streams that service municipal water sources and the Potomac River, our concerns are far more immediate in both time and distance. Well water is the only water source available in the area of the proposed zoning change and, with the exception of Fox Glen, a majority of this water is supplied by private wells. Therefore, the groundwater aquifer fulfills a critical necessity, fulfilling all needs including human consumption, household uses, and agriculture and

maintenance of livestock and horses in the immediate area around the site. The concern is that if the aquifer becomes contaminated, then the local drinking water will be fouled.

For decades now, policy makers have been using “Aquifer Vulnerability,” to set land use and water resource protection policy. Karst has very high Aquifer Vulnerability. Therefore, this industrial use is not appropriate for this land and it should not be zoned for it. The guiding documents of the WVDEP recognize this. The introduction to the WVDEP document Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.”

The Chesapeake Bay Stormwater Network karst stormwater guidance document the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed, which the WVDEP cites in its own guiding document Stormwater Management Design in Karst Areas, clearly agrees stating:

“First, the effect of land development on karst terrain is complex and hard to predict, and requires professional analysis to reduce the risk of geological hazards, damage to infrastructure and groundwater contamination.” “The working group acknowledges that past approaches to stormwater and land development in karst terrain have been inadequate to safeguard the public and the environment.” “...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” We clearly need stronger comprehensive land use plans and zoning that direct new growth away from karst areas to more appropriate locations. Ordinance #2017-302 is literally the opposite of this.

Further, we cannot rely on the WVDEP to do the job that good local land use guidelines and zoning should do. For example, the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed states that detention and retention ponds are not recommended on karst and categorize them as discouraged. Also, quoting WVDEP’s own karst guidance: “attenuating surface runoff will increase the rate of sinkhole formation and potential groundwater contamination.” Yet the entity currently planning to utilize this zoning change is planning employment of multiple massive retention ponds and attenuating surface runoff completely. This has already been approved by the DEP in two Construction Stormwater General Permit registrations for that company. One of detention ponds is not even regulated by the DEP as it contains process water and has no outlet. Clearly the DEP recognizes the risks but is not appropriately limiting them. Relying on the DEP to protect the public health, safety, welfare, and the environment from any entity in these karst locations is simply as the CNS bulletin said it “inadequate to safeguard the public and the environment.” We must have appropriate zoning that takes into consideration appropriate use of land with karst hydrogeology. Ordinance #2017-302 does not do this, but instead increases the risk to the public and the environment.

A second serious concern is the air emissions from the industry that this zoning will provide for. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. These types of air emissions have been shown to increase the risk of, contribute to, and exacerbate a multitude of developmental, physical, physiological, physiological, cognitive and economic. The exposure of one individual can cause repercussions in multiple generations. Embryos, fetuses, and children are most vulnerable with effects born out over a lifetime, and that of their offspring. Many of these effects only require short-term exposure and some have even been shown to occur at levels below current limits recommended by the World Health Organization. One example of this is that a recent study found that “Even within the limits set by the World Health Organization, the pollutants PM₁₀, SO₂, NO₂, and O₃ are associated with increased risk of treatment for respiratory diseases in children 0 to 6 years of age.” Unfortunately, the US limits are higher than WHO, 300 % higher in the case of PM₁₀!

In fact, in 2019, in the Advice from the Independent Particulate Matter Review Panel (formerly U.S. EPA Clean Air Scientific Advisory Committee Particulate Matter Review Panel) on EPA’s Policy Assessment for the Review of the National Ambient Air Quality Standards for Particulate Matter, it stated that the committee unanimously and unequivocally found that the current primary annual and 24-hour PM_{2.5} National Ambient Air Quality Standards (NAAQS) are not adequate to protect public health. The advice from this 20-member committee, whose scientific disciplines include epidemiology, medicine, toxicology, air quality measurement, air quality modeling, exposure assessment measurement and modeling, risk assessment, statistics, and others, was ignored due presumably to political pressure. Not only are the NAAQS too high in some cases, but due to the measure and mechanism by which they work, they can not replace the safety provided by good land use and zoning regulations, that are meant to do things like keep factories with air emissions and hundreds of heavy trucks away from elementary schools. In fact, there is a state law that prohibits siting a school near a factory. Unfortunately, the reciprocal law does not exist. Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask you to vote NO on Ordinance #2017-302. The industry this zoning change will allow for endangers the health, safety and, welfare of the community, and violates the premise of the smart code zoning that we have spent so much time, effort and federal money employing.

Any change in zoning needs to align with the comprehensive plan. In Ranson's current comprehensive plan (2012), the city only refers to "heavy industry" in the history section. Here it is characterized as part of a bygone era that has been replaced by an emphasis on agriculture for local food production, open spaces, and quality-of-life. In the remainder of the document, the word industry is used loosely to describe businesses including flower shops and shoe stores. Nothing that resembles the industry that this zoning change will provide for is described in the current comprehensive plan of Ranson.

In the land use section of the comprehensive plan, number ten states:

"Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The comprehensive plan clearly states that the city will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community. This change in zoning clearly negatively affects the health, safety, and welfare of the community.

As the zoning is proposed, the industry that this zoning change will allow for will be directly across the street from houses, parks and other small businesses. A densely populated subdivision and an elementary school already exit directly across the street. While these latter

community sections are not in the city limits, the effect of this zoning on them should still be considered just the same as it would be if they were in the city limits.

The industry that this zoning change will provide for will produce particulate, gaseous, and hazardous air emissions. These emissions have been shown to be detrimental to human health at every stage of life from embryo to old age. In utero and childhood exposure are the most damaging with lasting effects being realized through out life, and with maternal exposure the effects can be felt for generations. Multiple organ systems are affected including respiratory, cardiovascular, neurologic, immune, and endocrine causing defects in multiple processes including in utero development, neurodevelopment, immune and tolerance development, and cognitive defects. There are also psychological, social, and economic effects from both perceived and actual air pollution in both children and adults. Many of these effects can be seen even with short-term exposure or exposure that is lower than the levels recommended by the US Environmental Protection Agency and World Health Organization. These consequences are devastating to the individual and depressing to the local community and economy. State law does not allow a school to be built next to industry that this zoning will allow but yet we are contemplating changing the zoning so this industry can build next to a school. This does not make sense. As Ranson residents, we want Ranson to follow the lead of the state and keep polluting industry away from kids. In these ways, this change in zoning will negatively affect the health and welfare of the community.

In addition to the health effects of the air emissions is the threat to groundwater from the industry that this zoning change would allow. The land in question has karst hydrogeology and therefore very high aquifer vulnerability and is not appropriate for this industry. With the type of industry this zoning will provide for, combined with high aquifer vulnerability, the likelihood of groundwater contamination is too high for the community and region to bear. A USGS study demonstrated that contamination in the groundwater adjacent to the site moves relatively quickly and can be found in wells and surface water structures in a variety of locations in the County. In this way, contamination at the site would affect the drinking water of the great majority of Jefferson County residents. Through the surface water connections, the water at the site also affects the water resources of the region.

Aquifer vulnerability has been used by policy makers for decades to set land use regulations. The guiding document, from the WVDEP, Stormwater Management Design in Karst Areas states, "it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." In Ranson, we need to follow this advice and not change the zoning of this land for use by industry that has among the highest aquifer vulnerability in the County. This zoning change will endanger the safety of the community and region by endangering the safe water resources. As Ranson residents, we want to safeguard the water resources of the county and region by following the WVDEP guidance here.

Further, by reallocating this transect district and replacing it with a monolithic block of Special District Industrial designation, hundreds of housing units, parks and space for small businesses are lost. Ranson loses the potential for property tax on these properties and their improvements, Business and Occupational tax on the businesses and sales tax in retail stores. The community loses out on the opportunity to develop affordable housing and create locations where people can live, work, play, and shop all in the same place reducing the need for travel.

Worse yet apparently a deal has been made where the entity that owns the subject land has required that a litany of things not be built on the adjacent land essentially stripping the purpose of the smart code transect zone that exists there. Transect zones in the smart code are meant to transition, from out to in, and provide communities where people can safely work and live in close proximity in an effort to reduce travel. Excluding many of the components of the transect zone effectively eliminates the features that make it a transect zone, thus, losing the benefits a transect zone offers the community and city. By losing these benefits, reducing the overall and affordable housing prospects, and reducing so drastically the opportunities for city income, this zoning change will negatively affect the welfare of the community.

As Ranson residents, we find it odd that we are changing zoning to provide for industry that we would not put in the middle of our town close to our residents, but we are placing it close to the homes of county residents. Further, it is striking that the area where this change in zoning is directly adjacent to historically underserved lower income communities and a Title I school. This amounts to environmental injustice and cannot be tolerated.

The purpose of zoning is for a city to protect the health, welfare, morals and safety of the community. In this case, the air emissions and heavy truck traffic will endanger the communities' health. The threat of water contamination will endanger the safety of the community. The effect of lost productivity and decreased workforce participation due to increased illness and the negative effect the air emissions and presence of such a factory will have on the local economy will negatively affect the welfare of the community. The environmental injustice of changing the zoning to accommodate such polluting industry in a location where your municipality has no residents, but yet hundreds of low income and underserved county residents live is egregiously amoral. This must not happen. We respectfully implore you to do the right thing and vote no on ordinance #2017-302.

Sincerely,

Travis Patton

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Carol Hopkins

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would negatively affect tourism, economic agility, groundwater quality, and individual health in neighboring municipalities like Shepherdstown. In doing these things the industry that this zoning change provides for will adversely affect the health, safety, and welfare of our community.

Tourism is critically important to Shepherdstown's economy and to the county as a whole. In 2018, tourist spending in the Jefferson County contributed over \$170 million to state and local government revenue and \$213 million in individual earnings. Importantly, most of this money comes from tourists visiting from neighboring states like Virginia, Maryland, and Washington D.C. Out-of-state tourists are largely drawn to Jefferson County because of its reputation for environmental-friendly, sustainable industry. Key elements that support this reputation include the county's pastoral scenery and pristine natural resources. Ordinance #2017-302 will allow industry into Jefferson County that risks harming these elements and dramatically reducing the area's appeal to visitors. The resulting harm to our tourist industry would drive away visitors and decrease state, county, and local revenue. The long-term success of Jefferson County's tourism industry is dependent on local governments making coordinated zoning decisions. Allowing certain types in industry in Ranson will negatively affect tourism in every municipality throughout the county, including Shepherdstown. Voting no on ordinance #2017-302 will protect the foundations of the county's tourism industry and protect the 7,040 jobs in Jefferson County that are directly supported by tourism. In this way, the industry this zoning change will allow will adversely affect the welfare of our community.

The type of large, consolidated industry that ordinance #2017-302 would allow in Ranson would generally reduce the flexibility of local economies in Jefferson County. Historically, the driving industries in Jefferson County have been tourism, agriculture, and the equine industries. These three industries are large conglomerates of small businesses. Small business is very important

to Shepherdstown. Small businesses have been shown to create more jobs, cultivate more innovation, and provide more opportunities than big, non-local firms. Additionally, small businesses have been shown to be more reactive to sudden changes relative to manufacturing businesses. Bringing large, manufacturing-based industry into Jefferson county will depress the local economy and stifle innovation. During this time of economic upheaval and uncertainty, Jefferson County needs to support industries that will allow local economies to adapt and recover as fast as possible.

Voting no on ordinance #2017-302 will help protect water resources throughout Jefferson County. The type of industry that ordinance #2017-302 would allow puts the ground resources of Jefferson county at significant risk due to the karst hydrogeology. The site in Ranson is in the Rocky Marsh Run watershed, which is in the source water protection zone for Shepherdstown and drains to the Potomac River. Therefore, activity at this site will affect both groundwater and surface water streams. In municipalities like Shepherdstown, many residents and nearby farms depend on wells for water. Contamination of groundwater aquifers would create both health and remediation concerns for local residents. Dye tests performed by the USGS near the area of proposed rezoning in Ranson have shown just how far-reaching groundwater contamination at the Ranson site could be. Results from the USGS study revealed measurable dye concentrations in Elk's Run, Rattlesnake Run, and even the Shepherdstown Town Run. This last run cuts through the center of Shepherdstown and is a favorite area for children to play and learn to fish. In this way, the industry that this zoning change will allow will adversely affect the safety of our community.

Groundwater pollution is not the only concern for communities like Shepherdstown. The type of industry that ordinance #2017-302 would allow in Ranson would also generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. These pollutants are particularly harmful to children. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. The site in Ranson is across the road from an elementary school and also within the Jefferson High Middle district. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of children in Shepherdstown and all of Jefferson County. In this way, the industry that this zoning change will provide for will adversely affect the health of our community.

I again request that you vote no on ordinance #2017-302. This zoning change will allow industry that will adversely affect the health, safety, and welfare of our community. The long-term economic, environmental, and community health of municipalities like Shepherdstown depend on Ranson's participation in a coordinated zoning plan for all of Jefferson County.

Sincerely,

Hollann Schwartz

To: spfaltzgraff@ransonwv.us; dpierson@ransonwv.us; gtaylor@ransonwv.us; scoulter@frontiernet.net; tgrant@ransonwv.us; astroud@ransonwv.us; andersonantS@aol.com; donhainessr@gmail.com
Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on #2017-302. The air emissions, possibility of ground and surface water contamination, and their effect on our interwoven economies threaten the health, safety and welfare of not just Jefferson County but the greater region, including Loudoun and the greater Northern Virginia area.

This zoning would provide for industry that produces large amounts of air emissions. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. Northern Virginia is directly downwind from these emissions. Much of the gaseous, fine particulate, and hazardous emissions can reach Northern Virginia. Further affecting the outdoor air quality of the adjacent portion of Virginia and the ability of these areas to achieve and maintain National Ambient Air Quality Standards (NAAQS) attainment. This will affect agriculture and outdoor leisure and recreation.

For example, Loudoun County has been in nonattainment for the NAAQS 8-hour Ozone standard for the past two years. VOC and NO_x react after they have been emitted to produce ground level ozone. The industry that this rezoning would provide for would produce large amounts of these emissions. This would make it even harder as Loudoun County tries to achieve attainment. As time goes on and the scientific research advances our knowledge and understanding of the extent to which gaseous, particulate and hazardous emissions affect human health the NAAQS standards are likely to be reduced. The effects on air emission from this rezoning will make it only harder for Loudoun and Northern Virginia to meet these standards.

In addition to the concerns about the air, the possible ground and surface water contamination is very concerning to Loudoun and Virginia residents. The site is known to have ground water that is vulnerable to contamination due to the karst hydrogeology. A USGS study demonstrated that the ground water adjacent to the site to be rezoned communicates readily with surface

water tributaries of the Potomac River. In addition to direct infiltration where water moves directly from the surface to groundwater via porous limestone bedrock, karst is known to have severe ground instability problems. This makes karst geology prone to sinkhole development. Sinkholes provide direct connection between the surface water and any contaminants it may contain and the groundwater. This makes the aquifer vulnerability in karst areas very high, and contamination with industrial activity such as that provided for by this rezoning too likely. In this way, this zoning change will adversely affect the health and welfare of individuals and the community.

Loudoun sources its drinking water from the Potomac River, downstream of many West Virginia tributaries that carry water from the epikarst and groundwater aquifer at the site to be rezoned. Loudoun has recently completed the new Trap Rock Water Treatment facility, which draws water from the Potomac River. Loudoun currently provides 40 million gallons and projects to provide 90 million gallons of drinking water a day to customers by 2040 (Loudounwater.org). Therefore, the viability of the Potomac River is a high priority for Virginia residents.

Loudoun and Northern Virginia is one of the fastest growing communities in the country and provides a lot to Jefferson County in their symbiotic relationship. Virginia residents support and enjoy Jefferson County through tourism, as our residents enjoy the natural and historical resources of your county. Virginia residents and businesses support the equine industry in a multitude of ways from providing wagering fans at the races to the Virginia Breeders Association Virginia Certified incentive programs and a strong market for retired racehorses. According to an economic impact study from WVU, at least 40% of Jefferson County residents travel outside of West Virginia for work, a good percentage of those travel to northern Virginia. This rezoning would allow for industry that would negatively affect the economy of both places and this relationship and the benefits for our residents gleaned from it.

This zoning change will provide for industry that will negatively effect the health safety and welfare of the Loudon and Northern Virginia community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

CK Knight

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

William Rule

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask you to vote NO on Ordinance #2017-302. The industry this zoning change will allow for endangers the health, safety and, welfare of the community, and violates the premise of the smart code zoning that we have spent so much time, effort and federal money employing.

Any change in zoning needs to align with the comprehensive plan. In Ranson's current comprehensive plan (2012), the city only refers to "heavy industry" in the history section. Here it is characterized as part of a bygone era that has been replaced by an emphasis on agriculture for local food production, open spaces, and quality-of-life. In the remainder of the document, the word industry is used loosely to describe businesses including flower shops and shoe stores. Nothing that resembles the industry that this zoning change will provide for is described in the current comprehensive plan of Ranson.

In the land use section of the comprehensive plan, number ten states:

"Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The comprehensive plan clearly states that the city will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community. This change in zoning clearly negatively affects the health, safety, and welfare of the community.

As the zoning is proposed, the industry that this zoning change will allow for will be directly across the street from houses, parks and other small businesses. A densely populated subdivision and an elementary school already exit directly across the street. While these latter

community sections are not in the city limits, the effect of this zoning on them should still be considered just the same as it would be if they were in the city limits.

The industry that this zoning change will provide for will produce particulate, gaseous, and hazardous air emissions. These emissions have been shown to be detrimental to human health at every stage of life from embryo to old age. In utero and childhood exposure are the most damaging with lasting effects being realized through out life, and with maternal exposure the effects can be felt for generations. Multiple organ systems are affected including respiratory, cardiovascular, neurologic, immune, and endocrine causing defects in multiple processes including in utero development, neurodevelopment, immune and tolerance development, and cognitive defects. There are also psychological, social, and economic effects from both perceived and actual air pollution in both children and adults. Many of these effects can be seen even with short-term exposure or exposure that is lower than the levels recommended by the US Environmental Protection Agency and World Health Organization. These consequences are devastating to the individual and depressing to the local community and economy. State law does not allow a school to be built next to industry that this zoning will allow but yet we are contemplating changing the zoning so this industry can build next to a school. This does not make sense. As Ranson residents, we want Ranson to follow the lead of the state and keep polluting industry away from kids. In these ways, this change in zoning will negatively affect the health and welfare of the community.

In addition to the health effects of the air emissions is the threat to groundwater from the industry that this zoning change would allow. The land in question has karst hydrogeology and therefore very high aquifer vulnerability and is not appropriate for this industry. With the type of industry this zoning will provide for, combined with high aquifer vulnerability, the likelihood of groundwater contamination is too high for the community and region to bear. A USGS study demonstrated that contamination in the groundwater adjacent to the site moves relatively quickly and can be found in wells and surface water structures in a variety of locations in the County. In this way, contamination at the site would affect the drinking water of the great majority of Jefferson County residents. Through the surface water connections, the water at the site also affects the water resources of the region.

Aquifer vulnerability has been used by policy makers for decades to set land use regulations. The guiding document, from the WVDEP, Stormwater Management Design in Karst Areas states, "it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." In Ranson, we need to follow this advice and not change the zoning of this land for use by industry that has among the highest aquifer vulnerability in the County. This zoning change will endanger the safety of the community and region by endangering the safe water resources. As Ranson residents, we want to safeguard the water resources of the county and region by following the WVDEP guidance here.

Further, by reallocating this transect district and replacing it with a monolithic block of Special District Industrial designation, hundreds of housing units, parks and space for small businesses are lost. Ranson loses the potential for property tax on these properties and their improvements, Business and Occupational tax on the businesses and sales tax in retail stores. The community loses out on the opportunity to develop affordable housing and create locations where people can live, work, play, and shop all in the same place reducing the need for travel.

Worse yet apparently a deal has been made where the entity that owns the subject land has required that a litany of things not be built on the adjacent land essentially stripping the purpose of the smart code transect zone that exists there. Transect zones in the smart code are meant to transition, from out to in, and provide communities where people can safely work and live in close proximity in an effort to reduce travel. Excluding many of the components of the transect zone effectively eliminates the features that make it a transect zone, thus, losing the benefits a transect zone offers the community and city. By losing these benefits, reducing the overall and affordable housing prospects, and reducing so drastically the opportunities for city income, this zoning change will negatively affect the welfare of the community.

As Ranson residents, we find it odd that we are changing zoning to provide for industry that we would not put in the middle of our town close to our residents, but we are placing it close to the homes of county residents. Further, it is striking that the area where this change in zoning is directly adjacent to historically underserved lower income communities and a Title I school. This amounts to environmental injustice and cannot be tolerated.

The purpose of zoning is for a city to protect the health, welfare, morals and safety of the community. In this case, the air emissions and heavy truck traffic will endanger the communities' health. The threat of water contamination will endanger the safety of the community. The effect of lost productivity and decreased workforce participation due to increased illness and the negative effect the air emissions and presence of such a factory will have on the local economy will negatively affect the welfare of the community. The environmental injustice of changing the zoning to accommodate such polluting industry in a location where your municipality has no residents, but yet hundreds of low income and underserved county residents live is egregiously amoral. This must not happen. We respectfully implore you to do the right thing and vote no on ordinance #2017-302.

Sincerely,

Daniel Liverette

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would put at risk the health and well being of children of Jefferson County.

The type of industry that ordinance #2017-302 would allow in Ranson would generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. Exposure to these pollutants has devastating effects on children's health. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. Developing fetuses whose mothers are exposed to air pollution are more likely to have impaired organ development which can lead to early cognitive deficits, neurodevelopmental defects and other physical, cognitive, and psychological deficits later in life. An association between autism and prenatal exposure to particulate matter in air pollution has been demonstrated in several studies. Many studies have shown that lower test scores in math, English, and language arts are associated with exposure to outdoor air pollution. Industrial activity allowed by ordinance #2017-302 would also increase the risk of groundwater contamination in Ranson and nearby municipalities. Children whose families rely on well water, as is the case in much of Jefferson County, may be affected by polluted water. Voting no on ordinance #2017-302 will prevent air and water pollution from negatively affecting the long-term health of children in Jefferson County and surrounding areas.

The economic and environmental harm caused by the type of industry that ordinance #2017-302 would allow would put additional stress on the parents, caretakers, and teachers of children in affected areas. The weakening and destabilizing of this support network would have negative effects on local children. Many households in Jefferson County depend on the local agriculture, tourism, and equine industries for income. If industrial activity in Ranson depresses these industries, the resulting financial strain on these households will introduce additional stress and uncertainty into children's lives. Households living in areas affected by particulate

matter and regional haze will also suffer from the psychological effects of air pollution. Individuals living in areas with increase perception of pollution show increased levels of stress, anxiety, and unhappiness. School districts affected by increased air and water pollution may have trouble recruiting and retaining teachers. Teachers have a large influence on a child's daily life and, if educator quality and tenure decreases, the quality of this influence will diminish.

The site of the proposed rezoning in Ranson is across the road from an elementary school and proximal to lower-income neighborhoods. Observations like these demonstrate how ordinance #2017-302 would disproportionately affect vulnerable and historically-disadvantaged populations. The damaging health effects of air pollution have been shown to persist for at least three generations, so allowing certain types of industry in low-income areas would only compound existing disadvantages. Voting no on ordinance #2017-302 would be a step towards acknowledging that all individuals have the right to clean air and water.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." This zoning change would clearly adversely affect the health, safety, and welfare of the community. Children face increased exposure to air pollution adversely affecting their health, financial instability adversely affecting their welfare, groundwater contamination adversely affecting their safety, and environmental injustice and discrimination if ordinance #2017-302 is passed. Educators will face increased air pollution adversely affecting their health and consequently welfare. These adverse effects are all against Ranson's Comprehensive Plan. Please vote NO on Ordinance #2017-302.

Sincerely,

Julie Flanagan

Through the surface water connections, the water at the site also affects the water resources of the region.

Aquifer vulnerability has been used by policy makers for decades to set land use regulations. The guiding document, from the WVDEP, Stormwater Management Design in Karst Areas states, "it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." In Ranson, we need to follow this advice and not change the zoning of this land for use by industry that has among the highest aquifer vulnerability in the County. This zoning change will endanger the safety of the community and region by endangering the safe water resources. As Ranson residents, we want to safeguard the water resources of the county and region by following the WVDEP guidance here.

Further, by reallocating this transect district and replacing it with a monolithic block of Special District Industrial designation, hundreds of housing units, parks and space for small businesses are lost. Ranson loses the potential for property tax on these properties and their improvements, Business and Occupational tax on the businesses and sales tax in retail stores. The community loses out on the opportunity to develop affordable housing and create locations where people can live, work, play, and shop all in the same place reducing the need for travel.

Worse yet apparently a deal has been made where the entity that owns the subject land has required that a litany of things not be built on the adjacent land essentially stripping the purpose of the smart code transect zone that exists there. Transect zones in the smart code are meant to transition, from out to in, and provide communities where people can safely work and live in close proximity in an effort to reduce travel. Excluding many of the components of the transect zone effectively eliminates the features that make it a transect zone, thus, losing the benefits a transect zone offers the community and city. By losing these benefits, reducing the overall and affordable housing prospects, and reducing so drastically the opportunities for city income, this zoning change will negatively affect the welfare of the community.

As Ranson residents, we find it odd that we are changing zoning to provide for industry that we would not put in the middle of our town close to our residents, but we are placing it close to the homes of county residents. Further, it is striking that the area where this change in zoning is directly adjacent to historically underserved lower income communities and a Title I school. This amounts to environmental injustice and cannot be tolerated.

The purpose of zoning is for a city to protect the health, welfare, morals and safety of the community. In this case, the air emissions and heavy truck traffic will endanger the communities' health. The threat of water contamination will endanger the safety of the community. The effect of lost productivity and decreased workforce participation due to increased illness and the negative effect the air emissions and presence of such a factory will have on the local economy will negatively affect the welfare of the community. The environmental injustice of changing the zoning to accommodate such polluting industry in a location where your municipality has no residents, but yet hundreds of low income and underserved county residents live is egregiously amoral. This must not happen. We respectfully implore you to do the right thing and vote no on ordinance #2017-302.

Sincerely,

Adriana Torres

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask that you vote no on Ordinance #2017-302. While not in Ranson, the land and homes around the property that is the subject of the zoning change are closer to the property than anyone who currently lives within the city limits of Ranson. This area will be affected sooner and more harshly by the environmental issues that will develop secondary to the inappropriate siting of industry this zoning would allow.

The subject land has been well studied by Drs. Kozar, Doctor and Doctor and described in the scientific literature and USGS reports as having karst hydrology with very high aquifer vulnerability. The karst landscape is a consequence of the presence of soluble bedrock, which consists of limestone in the case of the subject land. In such landscapes water percolates through the ground and dissolves the underlying rock creating a porous network of caverns and throughways. Karst aquifers are known to be "extremely vulnerable to pollution" due to direct connection between the surface water and groundwater through both point (sinkholes) and diffuse (everywhere) infiltration. It is known from the Voluntary Remediation Plan of Jefferson Orchard that the groundwater at the subject site is only 60 feet below the ground. The subject property and much of the property around it are on an upland plain with few surface streams, but great seasonal variability in the water table resulting in numerous esteves and large amounts of water in the epikarst. This water is easily contaminated and this contamination spreads quickly throughout the aquifer. Dye tests performed near the subject site by the USGS have demonstrated this quick moving thorough dispersment in the aquifer in this area. While this contamination goes on to affect springs at the margins of the upland area continuing on in streams that service municipal water sources and the Potomac River, our concerns are far more immediate in both time and distance. Well water is the only water source available in the area of the proposed zoning change and, with the exception of Fox Glen, a majority of this water is supplied by private wells. Therefore, the groundwater aquifer fulfills a critical necessity, fulfilling all needs including human consumption, household uses, and agriculture and

maintenance of livestock and horses in the immediate area around the site. The concern is that if the aquifer becomes contaminated, then the local drinking water will be fouled.

For decades now, policy makers have been using “Aquifer Vulnerability,” to set land use and water resource protection policy. Karst has very high Aquifer Vulnerability. Therefore, this industrial use is not appropriate for this land and it should not be zoned for it. The guiding documents of the WVDEP recognize this. The introduction to the WVDEP document Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.”

The Chesapeake Bay Stormwater Network karst stormwater guidance document the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed, which the WVDEP cites in its own guiding document Stormwater Management Design in Karst Areas, clearly agrees stating:

“First, the effect of land development on karst terrain is complex and hard to predict, and requires professional analysis to reduce the risk of geological hazards, damage to infrastructure and groundwater contamination.” “The working group acknowledges that past approaches to stormwater and land development in karst terrain have been inadequate to safeguard the public and the environment.” “...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” We clearly need stronger comprehensive land use plans and zoning that direct new growth away from karst areas to more appropriate locations. Ordinance #2017-302 is literally the opposite of this.

Further, we cannot rely on the WVDEP to do the job that good local land use guidelines and zoning should do. For example, the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed states that detention and retention ponds are not recommended on karst and categorize them as discouraged. Also, quoting WVDEP’s own karst guidance: “attenuating surface runoff will increase the rate of sinkhole formation and potential groundwater contamination.” Yet the entity currently planning to utilize this zoning change is planning employment of multiple massive retention ponds and attenuating surface runoff completely. This has already been approved by the DEP in two Construction Stormwater General Permit registrations for that company. One of detention ponds is not even regulated by the DEP as it contains process water and has no outlet. Clearly the DEP recognizes the risks but is not appropriately limiting them. Relying on the DEP to protect the public health, safety, welfare, and the environment from any entity in these karst locations is simply as the CNS bulletin said it “inadequate to safeguard the public and the environment.” We must have appropriate zoning that takes into consideration appropriate use of land with karst hydrogeology. Ordinance #2017-302 does not do this, but instead increases the risk to the public and the environment.

A second serious concern is the air emissions from the industry that this zoning will provide for. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. These types of air emissions have been shown to increase the risk of, contribute to, and exacerbate a multitude of developmental, physical, physiological, physiological, cognitive and economic. The exposure of one individual can cause repercussions in multiple generations. Embryos, fetuses, and children are most vulnerable with effects born out over a lifetime, and that of their offspring. Many of these effects only require short-term exposure and some have even been shown to occur at levels below current limits recommended by the World Health Organization. One example of this is that a recent study found that “Even within the limits set by the World Health Organization, the pollutants PM₁₀, SO₂, NO₂, and O₃ are associated with increased risk of treatment for respiratory diseases in children 0 to 6 years of age.” Unfortunately, the US limits are higher than WHO, 300 % higher in the case of PM₁₀!

In fact, in 2019, in the Advice from the Independent Particulate Matter Review Panel (formerly U.S. EPA Clean Air Scientific Advisory Committee Particulate Matter Review Panel) on EPA’s Policy Assessment for the Review of the National Ambient Air Quality Standards for Particulate Matter, it stated that the committee unanimously and unequivocally found that the current primary annual and 24-hour PM_{2.5} National Ambient Air Quality Standards (NAAQS) are not adequate to protect public health. The advice from this 20-member committee, whose scientific disciplines include epidemiology, medicine, toxicology, air quality measurement, air quality modeling, exposure assessment measurement and modeling, risk assessment, statistics, and others, was ignored due presumably to political pressure. Not only are the NAAQS too high in some cases, but due to the measure and mechanism by which they work, they can not replace the safety provided by good land use and zoning regulations, that are meant to do things like keep factories with air emissions and hundreds of heavy trucks away from elementary schools. In fact, there is a state law that prohibits siting a school near a factory. Unfortunately, the reciprocal law does not exist. Clearly, just like with the water resources, we cannot rely on the DEP or the EPA to do the job of what appropriate zoning should do. The whole point of zoning is to keep people safe and provide for their health and welfare. Ordinance #2017-302 puts families and school children directly in harms way.

The air emissions, threat to the groundwater, and the very presence of the industry that this zoning change will allow for will have a serious negative economic effect on those who live and or work closest to the site in question. Productivity and workforce participation will be negatively affected by the health effects of the air emissions. The local agricultural operations will be negatively affected by the air emissions with lower quantity and quality of crop yield and would be devastated if the ground water aquifer were fouled. The equine operations in the area, of which there are several, will be negatively affected by the air emissions as they affect the horses’ health and performance. The mere presence of the industry that will be provided for by this zoning change will cause property values to fall. There will be serious economic consequences for the immediate area around the site in question.

Several of the communities in the immediate area of the site for proposed zoning change are traditionally underserved and have lower economic status. The choice of this location for such a zoning change represents an egregious example of environmental injustice that should not be promulgated or tolerated.

This zoning change will provide for industry that will negatively affect the health safety and welfare of our community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

George Sanders

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City and intended longterm development of Jefferson County. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the health and welfare of the community.

The hydrogeology at the location is well-known to be inappropriate for the type of industry this rezoning will allow. The Comprehensive Plan as quoted above states, "the City will designate ample land that is well-suited for industrial facilities." Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, "it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, "the City will designate ample land that is well-suited for industrial facilities." This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Julia Yuhasz

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Sheila Sirdu

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would put at risk the health and well being of children of Jefferson County.

The type of industry that ordinance #2017-302 would allow in Ranson would generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. Exposure to these pollutants has devastating effects on children's health. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. Developing fetuses whose mothers are exposed to air pollution are more likely to have impaired organ development which can lead to early cognitive deficits, neurodevelopmental defects and other physical, cognitive, and psychological deficits later in life. An association between autism and prenatal exposure to particulate matter in air pollution has been demonstrated in several studies. Many studies have shown that lower test scores in math, English, and language arts are associated with exposure to outdoor air pollution. Industrial activity allowed by ordinance #2017-302 would also increase the risk of groundwater contamination in Ranson and nearby municipalities. Children whose families rely on well water, as is the case in much of Jefferson County, may be affected by polluted water. Voting no on ordinance #2017-302 will prevent air and water pollution from negatively affecting the long-term health of children in Jefferson County and surrounding areas.

The economic and environmental harm caused by the type of industry that ordinance #2017-302 would allow would put additional stress on the parents, caretakers, and teachers of children in affected areas. The weakening and destabilizing of this support network would have negative effects on local children. Many households in Jefferson County depend on the local agriculture, tourism, and equine industries for income. If industrial activity in Ranson depresses these industries, the resulting financial strain on these households will introduce additional stress and uncertainty into children's lives. Households living in areas affected by particulate

matter and regional haze will also suffer from the psychological effects of air pollution. Individuals living in areas with increase perception of pollution show increased levels of stress, anxiety, and unhappiness. School districts affected by increased air and water pollution may have trouble recruiting and retaining teachers. Teachers have a large influence on a child's daily life and, if educator quality and tenure decreases, the quality of this influence will diminish.

The site of the proposed rezoning in Ranson is across the road from an elementary school and proximal to lower-income neighborhoods. Observations like these demonstrate how ordinance #2017-302 would disproportionately affect vulnerable and historically-disadvantaged populations. The damaging health effects of air pollution have been shown to persist for at least three generations, so allowing certain types of industry in low-income areas would only compound existing disadvantages. Voting no on ordinance #2017-302 would be a step towards acknowledging that all individuals have the right to clean air and water.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." This zoning change would clearly adversely affect the health, safety, and welfare of the community. Children face increased exposure to air pollution adversely affecting their health, financial instability adversely affecting their welfare, groundwater contamination adversely affecting their safety, and environmental injustice and discrimination if ordinance #2017-302 is passed. Educators will face increased air pollution adversely affecting their health and consequently welfare. These adverse effects are all against Ranson's Comprehensive Plan. Please vote NO on Ordinance #2017-302.

Sincerely,

Penny Manion

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on Ordinance #2017-302. Ranson's proposed zoning change presents a significant risk to the equine industry in Jefferson County and well beyond. The type of industry that would be allowed by the proposed zoning change in this location would jeopardize horse health, the ground water supply, and workforce productivity. This will cause immediate shrinkage and threaten the long-term viability of the equine industry in the county. In doing so, the industry this zoning change will allow for will adversely affect the health, safety, and welfare of our community.

The site of the proposed rezoning is less than six miles from Charles Town Races, with several breeding, training, and rehabilitation facilities between the two. The industry allowed by this rezoning would produce particulate, gaseous, and hazardous air emissions that would reach these sites. According to the WVDEP air permit, the Rockwool plant in Ranson is permitted to emit 250.87 tons of particulate matter per year into the air (1).

According to a recent study published in the journal of Veterinary Internal Medicine (2), horses are 15 times more sensitive to inhaled particulate matter than humans. Inhaled particulate matter can cause inflammation in horses' lungs that negatively affects performance. Inhaled particulate matter also contributes to the development of inflammatory airway disease (IAD) (3). IAD is a chronic airway disease that can affect horses long after their racing career is over. While there is little research on how other air pollutants affect horses, the effects of pollution on humans can be used to infer potential impact on horses. However unlike human models, these horses are elite athletes continuously exposed, and will thus likely experience detrimental effects at much lower levels of air pollution than humans.

The primary concern with air pollution is that increased levels of pollutants will increase inflammation in horses' lungs. Even small, subclinical amounts of inflammation in the lungs of horses negatively affect performance (2,3,4,5,6,11). This inflammation can also cause increased

recovery times following racing (7,11). Reduced performance and training interruptions can lead to higher risk of injury, reduced winning average, fewer yearly starts, lower yearly earnings, shortened career length, fewer lifetime starts, reduced lifetime earnings, and reduced quality of life (2,3,8,9,11). Each of these situations will lead to decreased return on investment, decreased cash flow, and decreased overall earnings for owners, trainers, and breeders with horses at Charles Town Races and in nearby areas. In this way, the industry this zoning will allow will adversely affect the welfare of our community.

While racing is usually a thoroughbred's first career, it is rarely their last. Some racing horses go on to be breeding stock, while others will have successful careers as sport horses. Jefferson County is an important source of new stock for sport horse trainers from Northern Virginia, and Maryland, and this is a resource for local horseman of both income and placement for horses not appropriate for breeding. However, if retired racehorses are unsound from injury or respiratory disease, they can be difficult to manage as breeding stock or unfit for a career as a sport horse. This affects the horse's quality of life and also places a burden on the industry locally and regionally. In this way, the industry this zoning will provide for will adversely affect the welfare of our community.

The perception of decreased air quality from the increase in regional haze and visible smokestacks as one drives into the county will deter out of state Owners and Breeders from investing in West Virginia bred Race horses, decreasing or eliminating a critical \$50 million a year source of local business volume. In this way, the industry this zoning will provide for will adversely affect the welfare of our community.

Another concern related to the proposed rezoning in Ranson is the risk of groundwater contamination as a result of the karst hydrogeology at the site and the industrial activity. Horsemen will either have to take on the expense of periodically testing water sources or they may not know local ground water is contaminated until their animals are sick. Veterinary care and testing adds expense and uncertainty to an industry that already deals with large inherent risks. The actual occurrence of ground water contamination would be devastating for Jefferson County's equine industry. For both geographic and financial reasons, it is simply impossible to think that the industry could solely use public or private utility-provided water if industrial activity fouled the local groundwater. In this way, the industry this zoning will provide for will adversely affect the health, safety, and welfare of our community.

Finally, studies on US agricultural workers have demonstrated that increased air pollution decreases productivity of outdoors workers. This would place an additional burden on workers, small business owners and the industry. In this way the industry this zoning will provide for will adversely affect the health, safety, and welfare of our community.

The equine industry in Jefferson County is hundreds of years old. It is not worth risking this historic and economically valuable industry by rezoning for industrial companies like Rockwool. An economic impact study of the Charles Town Thoroughbred Horse Racing Industry on Jefferson County's economy found that the spending by owners, breeders, and trainers of the

equine industry directly contributes \$79.4 million to the county each year. Out-of-state owners, breeders, and trainers spend more than \$50 million in Jefferson County every year. The value of total business volume in Jefferson County is \$191 million each year (10). These numbers do not include the effect of the handle or the casino.

The equine industry provides jobs for a broad cross-section of the public. This industry offers individuals of any educational background a variety of paths to achieve a good middle-income living. Many jobs allow individuals to pursue apprenticeships or on-the-job training rather than requiring a costly college education. This flexibility allows for greater lifetime earnings and improved educational debt-to-earnings ratio for these workers. The equine industry also provides opportunities for non-traditional workers by offering job opportunities to those who may not be employable by larger corporations. This industry provides a variety of fulltime, part-time, flexible, and pick-up work. Encouraging this type of flexible job ecosystem helps create a healthy economy with broad participation in employment and consumption.

The equine industry is a large conglomerate of small businesses, which have a multitude of economic benefits over having a few large businesses. It has been extensively reported that small locally owned businesses and start ups create more jobs, cultivate innovation, generate higher incomes, and provide more opportunities for individuals that would otherwise not exist than big non-local firms, which can actually depress local economies. The equine industry provides opportunities for small businesses and startups responsible for this growth of better jobs that are so good for the economy.

The equine industry offers so many other benefits that the industry in the rezoned area would not. For example, the equine industry supports local agriculture by providing a market for agricultural goods such as straw. The robust straw market supported by owners, trainers, and breeders allows for a third cash crop to be produced from one field in a year. Through pastureland and support of local agricultural goods, the equine industry protects and preserves the open spaces that give our county its bucolic quality and help attract tourists. Through the breeders' incentive programs, the equine industry offers unique opportunities to draft state funds back to Jefferson County, to name a few.

Rezoning this area of Ranson for Special District Industrial will allow in entities whose activities are harmful to the equine industry. The losses incurred by the equine industry would far outweigh any benefits derived from industries occupying the rezoned area. Sacrificing the long-term viability of one of our oldest and most productive industries for a net loss in business volume and economic value just does not make good sense for the local economy. This zoning change would provide for industry that would adversely affect the health, safety and welfare of our communities. Please vote NO on Ordinance #2017-302.

Sincerely,

Tom Moran

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

This county does not need an industrial sector. Berkeley county is more well suited to host industrial manufacturing and already hosts several large plants and factories. Jefferson City will not see a significant cost benefit to hosting industrial plants versus the environmental sustainability costs and negative affect on the health and wellbeing of our community.

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would

clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, "the City will designate ample land that is well-suited for industrial facilities." This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Q. Dan

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Please vote no on Ordinance #2017-302. We have a large horse farm in Jefferson County. Our livelihood would be severely impacted due to the reasons listed below. 150 factory jobs are not worth putting lives and the livelihoods of so many citizens at risk.

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on Ordinance #2017-302. Ranson's proposed zoning change presents a significant risk to the equine industry in Jefferson County and well beyond. The type of industry that would be allowed by the proposed zoning change in this location would jeopardize horse health, the groundwater supply, and workforce productivity. This will cause immediate shrinkage and threaten the long-term viability of the equine industry in the county. In doing so, the industry this zoning change will allow for will adversely affect the health, safety, and welfare of our community.

The site of the proposed rezoning is less than six miles from Charles Town Races, with several breeding, training, and rehabilitation facilities between the two. The industry allowed by this rezoning would produce particulate, gaseous, and hazardous air emissions that would reach these sites. According to the WVDEP air permit, the Rockwool plant in Ranson is permitted to emit 250.87 tons of particulate matter per year into the air (1).

According to a recent study published in the journal of Veterinary Internal Medicine (2), horses are 15 times more sensitive to inhaled particulate matter than humans. Inhaled particulate matter can cause inflammation in horses' lungs that negatively affects performance. Inhaled particulate matter also contributes to the development of inflammatory airway disease (IAD) (3). IAD is a chronic airway disease that can affect horses long after their racing career is over. While there is little research on how other air pollutants affect horses, the effects of pollution on humans can be used to infer potential impact on horses. However unlike human models, these horses are elite athletes continuously exposed, and will thus likely experience detrimental effects at much lower levels of air pollution than humans.

The primary concern with air pollution is that increased levels of pollutants will increase inflammation in horses' lungs. Even small, subclinical amounts of inflammation in the lungs of horses negatively affect performance (2,3,4,5,6,11). This inflammation can also cause increased recovery times following racing (7,11). Reduced performance and training interruptions can lead to higher risk of injury, reduced winning average, fewer yearly starts, lower yearly earnings, shortened career length, fewer lifetime starts, reduced lifetime earnings, and reduced quality of life (2,3,8,9,11). Each of these situations will lead to decreased return on investment, decreased cash flow, and decreased overall earnings for owners, trainers, and breeders with horses at Charles Town Races and in nearby areas. In this way, the industry this zoning will allow will adversely affect the welfare of our community.

While racing is usually a thoroughbred's first career, it is rarely their last. Some racing horses go on to be breeding stock, while others will have successful careers as sport horses. Jefferson County is an important source of new stock for sport horse trainers from Northern Virginia, and Maryland, and this is a resource for local horseman of both income and placement for horses not appropriate for breeding. However, if retired racehorses are unsound from injury or respiratory disease, they can be difficult to manage as breeding stock or unfit for a career as a sport horse. This affects the horse's quality of life and also places a burden on the industry locally and regionally. In this way, the industry this zoning will provide for will adversely affect the welfare of our community.

The perception of decreased air quality from the increase in regional haze and visible smokestacks as one drives into the county will deter out of state owners and breeders from investing in West Virginia bred Race horses, decreasing or eliminating a critical \$50 million a year source of local business volume. In this way, the industry this zoning will provide for will adversely affect the welfare of our community.

Another concern related to the proposed rezoning in Ranson is the risk of groundwater contamination as a result of the karst hydrogeology at the site and the industrial activity. Horsemen will either have to take on the expense of periodically testing water sources or they may not know local ground water is contaminated until their animals are sick. Veterinary care and testing adds expense and uncertainty to an industry that already deals with large inherent risks. The actual occurrence of ground water contamination would be devastating for Jefferson County's equine industry. For both geographic and financial reasons, it is simply impossible to think that the industry could solely use public or private utility-provided water if industrial activity fouled the local groundwater. In this way, the industry this zoning will provide for will adversely affect the health, safety, and welfare of our community.

Finally, studies on US agricultural workers have demonstrated that increased air pollution decreases productivity of outdoors workers. This would place an additional burden on workers, small business owners and the industry. In this way the industry this zoning will provide for will adversely affect the health, safety, and welfare of our community.

The equine industry in Jefferson County is hundreds of years old. It is not worth risking this historic and economically valuable industry by rezoning for industrial companies like Rockwool. An economic impact study of the Charles Town Thoroughbred Horse Racing Industry on Jefferson County's economy found that the spending by owners, breeders, and trainers of the equine industry directly contributes \$79.4 million to the county each year. Out-of-state owners, breeders, and trainers spend more than \$50 million in Jefferson County every year. The value of total business volume in Jefferson County is \$191 million each year (10). These numbers do not include the effect of the handle or the casino.

The equine industry provides jobs for a broad cross-section of the public. This industry offers individuals of any educational background a variety of paths to achieve a good middle-income living. Many jobs allow individuals to pursue apprenticeships or on-the-job training rather than requiring a costly college education. This flexibility allows for greater lifetime earnings and improved educational debt-to-earnings ratio for these workers. The equine industry also provides opportunities for non-traditional workers by offering job opportunities to those who may not be employable by larger corporations. This industry provides a variety of full-time, part-time, flexible, and pick-up work. Encouraging this type of flexible job ecosystem helps create a healthy economy with broad participation in employment and consumption.

The equine industry is a large conglomerate of small businesses, which have a multitude of economic benefits over having a few large businesses. It has been extensively reported that small locally owned businesses and start ups create more jobs, cultivate innovation, generate higher incomes, and provide more opportunities for individuals that would otherwise not exist than big non-local firms, which can actually depress local economies. The equine industry provides opportunities for small businesses and startups responsible for this growth of better jobs that are so good for the economy.

The equine industry offers so many other benefits that the industry in the rezoned area would not. For example, the equine industry supports local agriculture by providing a market for agricultural goods such as straw. The robust straw market supported by owners, trainers, and breeders allows for a third cash crop to be produced from one field in a year. Through pastureland and support of local agricultural goods, the equine industry protects and preserves the open spaces that give our county its bucolic quality and help attract tourists. Through the breeders' incentive programs, the equine industry offers unique opportunities to draft state funds back to Jefferson County, to name a few.

Rezoning this area of Ranson for Special District Industrial will allow in entities whose activities are harmful to the equine industry. The losses incurred by the equine industry would far outweigh any benefits derived from industries occupying the rezoned area. Sacrificing the long-term viability of one of our oldest and most productive industries for a net loss in business volume and economic value just does not make good sense for the local economy. This zoning change would provide for industry that would adversely affect the health, safety and welfare of our communities. please vote no on this ordinance for the sake of your citizens and the equine industry that is such an important part of this community.

Sincerely,

Katherine Funkhouser

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask that you vote no on Ordinance #2017-302. While not in Ranson, the land and homes around the property that is the subject of the zoning change are closer to the property than anyone who currently lives within the city limits of Ranson. This area will be affected sooner and more harshly by the environmental issues that will develop secondary to the inappropriate siting of industry this zoning would allow.

The subject land has been well studied by Drs. Kozar, Doctor and Doctor and described in the scientific literature and USGS reports as having karst hydrology with very high aquifer vulnerability. The karst landscape is a consequence of the presence of soluble bedrock, which consists of limestone in the case of the subject land. In such landscapes water percolates through the ground and dissolves the underlying rock creating a porous network of caverns and throughways. Karst aquifers are known to be "extremely vulnerable to pollution" due to direct connection between the surface water and groundwater through both point (sinkholes) and diffuse (everywhere) infiltration. It is known from the Voluntary Remediation Plan of Jefferson Orchard that the groundwater at the subject site is only 60 feet below the ground. The subject property and much of the property around it are on an upland plain with few surface streams, but great seasonal variability in the water table resulting in numerous estavelles and large amounts of water in the epikarst. This water is easily contaminated and this contamination spreads quickly throughout the aquifer. Dye tests performed near the subject site by the USGS have demonstrated this quick moving thorough dispersement in the aquifer in this area. While this contamination goes on to affect springs at the margins of the upland area continuing on in streams that service municipal water sources and the Potomac River, our concerns are far more immediate in both time and distance. Well water is the only water source available in the area of the proposed zoning change and, with the exception of Fox Glen, a majority of this water is supplied by private wells. Therefore, the groundwater aquifer fulfills a critical necessity, fulfilling all needs including human consumption, household uses, and agriculture and

maintenance of livestock and horses in the immediate area around the site. The concern is that if the aquifer becomes contaminated, then the local drinking water will be fouled.

For decades now, policy makers have been using “Aquifer Vulnerability,” to set land use and water resource protection policy. Karst has very high Aquifer Vulnerability. Therefore, this industrial use is not appropriate for this land and it should not be zoned for it. The guiding documents of the WVDEP recognize this. The introduction to the WVDEP document Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.”

The Chesapeake Bay Stormwater Network karst stormwater guidance document the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed, which the WVDEP cites in its own guiding document Stormwater Management Design in Karst Areas, clearly agrees stating:

“First, the effect of land development on karst terrain is complex and hard to predict, and requires professional analysis to reduce the risk of geological hazards, damage to infrastructure and groundwater contamination.” “The working group acknowledges that past approaches to stormwater and land development in karst terrain have been inadequate to safeguard the public and the environment.” “...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” We clearly need stronger comprehensive land use plans and zoning that direct new growth away from karst areas to more appropriate locations. Ordinance #2017-302 is literally the opposite of this.

Further, we cannot rely on the WVDEP to do the job that good local land use guidelines and zoning should do. For example, the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed states that detention and retention ponds are not recommended on karst and categorize them as discouraged. Also, quoting WVDEP’s own karst guidance: “attenuating surface runoff will increase the rate of sinkhole formation and potential groundwater contamination.” Yet the entity currently planning to utilize this zoning change is planning employment of multiple massive retention ponds and attenuating surface runoff completely. This has already been approved by the DEP in two Construction Stormwater General Permit registrations for that company. One of detention ponds is not even regulated by the DEP as it contains process water and has no outlet. Clearly the DEP recognizes the risks but is not appropriately limiting them. Relying on the DEP to protect the public health, safety, welfare, and the environment from any entity in these karst locations is simply as the CNS bulletin said it “inadequate to safeguard the public and the environment.” We must have appropriate zoning that takes into consideration appropriate use of land with karst hydrogeology. Ordinance #2017-302 does not do this, but instead increases the risk to the public and the environment.

A second serious concern is the air emissions from the industry that this zoning will provide for. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. These types of air emissions have been shown to increase the risk of, contribute to, and exacerbate a multitude of developmental, physical, physiological, physiological, cognitive and economic. The exposure of one individual can cause repercussions in multiple generations. Embryos, fetuses, and children are most vulnerable with effects born out over a lifetime, and that of their offspring. Many of these effects only require short-term exposure and some have even been shown to occur at levels below current limits recommended by the World Health Organization. One example of this is that a recent study found that “Even within the limits set by the World Health Organization, the pollutants PM₁₀, SO₂, NO₂, and O₃ are associated with increased risk of treatment for respiratory diseases in children 0 to 6 years of age.” Unfortunately, the US limits are higher than WHO, 300 % higher in the case of PM₁₀!

In fact, in 2019, in the Advice from the Independent Particulate Matter Review Panel (formerly U.S. EPA Clean Air Scientific Advisory Committee Particulate Matter Review Panel) on EPA’s Policy Assessment for the Review of the National Ambient Air Quality Standards for Particulate Matter, it stated that the committee unanimously and unequivocally found that the current primary annual and 24-hour PM_{2.5} National Ambient Air Quality Standards (NAAQS) are not adequate to protect public health. The advice from this 20-member committee, whose scientific disciplines include epidemiology, medicine, toxicology, air quality measurement, air quality modeling, exposure assessment measurement and modeling, risk assessment, statistics, and others, was ignored due presumably to political pressure. Not only are the NAAQS too high in some cases, but due to the measure and mechanism by which they work, they can not replace the safety provided by good land use and zoning regulations, that are meant to do things like keep factories with air emissions and hundreds of heavy trucks away from elementary schools. In fact, there is a state law that prohibits siting a school near a factory. Unfortunately, the reciprocal law does not exist. Clearly, just like with the water resources, we cannot rely on the DEP or the EPA to do the job of what appropriate zoning should do. The whole point of zoning is to keep people safe and provide for their health and welfare. Ordinance #2017-302 puts families and school children directly in harms way.

The air emissions, threat to the groundwater, and the very presence of the industry that this zoning change will allow for will have a serious negative economic effect on those who live and or work closest to the site in question. Productivity and workforce participation will be negatively affected by the health effects of the air emissions. The local agricultural operations will be negatively affected by the air emissions with lower quantity and quality of crop yield and would be devastated if the ground water aquifer were fouled. The equine operations in the area, of which there are several, will be negatively affected by the air emissions as they affect the horses’ health and performance. The mere presence of the industry that will be provided for by this zoning change will cause property values to fall. There will be serious economic consequences for the immediate area around the site in question.

Several of the communities in the immediate area of the site for proposed zoning change are traditionally underserved and have lower economic status. The choice of this location for such a zoning change represents an egregious example of environmental injustice that should not be promulgated or tolerated.

This zoning change will provide for industry that will negatively affect the health safety and welfare of our community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Todd Breeden

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Tanya Howard

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that will significantly harm the municipalities within Jefferson County and beyond effecting the health, welfare, and safety of our community. Harpers Ferry is a national treasure with the natural and historic resources tours flock to see each year and one of the communities that will be negatively impacted by this zoning change.

According to a 2019 study by the West Virginia Tourism Office, Jefferson County generated an average of \$178 million per year in tourism-derived revenue for state and local governments over the last 10 years, more than any other county in West Virginia by at least double. Tourism benefits the businesses and economy of Ranson and Jefferson County producing \$213.7 million in individual earning, 7040 jobs, and \$842.6 million in direct spending here in 2018. We would need 40 Project Shuttles to replace the individual earnings and 59 Rockwools to replace the jobs provided by the tourism industry in Jefferson County. It is important to note that most of the money generated by tourism in Jefferson County comes from neighboring states. In this way, it is like an export: not simply recycling money, but bringing money into the state increasing its wealth. Much of the economy in Harpers Ferry is based on this tourism industry. A threat to this industry poses a threat to the economy and welfare of our community.

One of the important drivers for tourism in Harpers Ferry is the Appalachian Trail. According to the Appalachian Trail Conservancy (ATC), Harpers Ferry is the psychologic midpoint of the Trail, and hikers often plan extended stays in Jefferson County with an obvious positive impact. The ATC reports that the smokestacks and associated lights will be visible in the viewshed of 15 vistas on the Appalachian Trail (AT). Studies have shown that quality of vistas and human impact on the environment are not only noticed by visitors, but effect their experience. Another study published in the Journal of Applied Recreation Research, found that points of interests and views drew visitors' attention and had a significant impact on their perception of the trail. It was also found that particularly beautiful vistas helped visitors overlook elements

that usually have a negative effect on trail experience like increased trail traffic. A 2009 study in Leisure Sciences revealed that scenic value was a perceptual theme of Appalachian Trail visitors, and that things as simple as dead trees visible in a vista can have a negative impact on visitors' overall perception. Imagine the effect the smokestacks will have from the 15 vistas from which they will be visible. The introduction of industrial activity made possible by the proposed rezoning in Ranson would have a negative effect on the scenic views of beautiful landscapes from the Appalachian Trail in Jefferson County.

The smokestacks are not all visitors will be able to see — the air pollution will create haze. The effect of regional haze on tourists was explored in a review article published in the Atmospheric Environment titled "Impaired visibility: the air pollution people see." A key takeaway on the negative affect of haze on vacationing tourists was summarized as follows:

"Vacations offer an escape from the routine and stress of our daily lives. Vacation destinations are often chosen based on their scenery; vacations are spent gazing at monuments, mountains, clouds, and oceans. Good visibility allows clear observation of distant features and appreciation of the inherent beauty of these scenes...Air pollution, which is often present in both our cities and parks, interferes with these attributes and can ruin the views vacationers travel to enjoy."

People seek bucolic, unspoiled areas to escape the stresses of urban areas. A 2004 study in Environment and Behavior found perceived pollution causes stress while viewing natural scenes has both psychological and physiological benefits, and a 2007 study confirmed these benefits. Two other studies found that people are emotionally affected by poor visibility, and tourists are disappointed when views are obscured by haze.

The combination of smokestacks and haze will mar the viewshed and will not only reduce the positive effects of a scenic landscape but also leave tourists disappointed and dissatisfied with their choice of destination. With these effects the welfare of the Harpers Ferry community would undoubtedly be endangered by the industry that this zoning change will provide for.

Multiple studies by doctors Kozar, Doctor, and Doctor have demonstrated that the land at this site to be rezoned is Karst with the highest likelihood of sinkhole development in the county, and that the groundwater aquifer there is incredibly sensitive to contamination from surface water. Further, this site is on an upland plain with relatively few surface streams, seasonal variability in the water table that results in numerous estavelles, and large amounts of water in the epikarst. In this area contamination in surface water communicates easily to the water in the epikarst via diffuse and point infiltration, and the springs at the margins of the upland area are directly affected by the water quality throughout the aquifer. According to Jefferson Orchards Voluntary Remediation Plan with the WVDEP, the groundwater at the site is approximately 60 feet below the ground, and the tests performed by the USGS have shown that groundwater from just adjacent to this site emerged in the headwaters of both the Elk's Run and Rattlesnake Run. This is critically important for Harpers Ferry because the Elk's Run headwaters is a spring about three miles southeast of the site and goes on to become the drinking water source for Harpers Ferry and Bolivar before emptying into the Potomac River.

The headwaters of Rattlesnake Run is a spring about 3.5 miles from the site and is also a tributary of the Potomac River. The Potomac River is the back up water source for Harpers Ferry. This means that the activity at the site will have a critical influence on the drinking water of Harpers Ferry. In this was the industry permitted by this change in zoning would undoubtedly endanger the health and safety of the community in Harpers Ferry.

The untoward health effects and individual economic consequences from the pollution emissions of the industry this rezoning will allow that will be born out over the length of people's lives and that of their decedents for at least three generations is an egregious example of environmental injustice that should not be tolerated. This zoning change may be in one of the poorest sections of the county, but the effects will be felt in every part of Ranson and the county.

The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." The industry that this rezoning will allow will jeopardize the health, safety and welfare of Ranson, Harpers Ferry and the whole county. Please vote no on the ordinance #2017-302.

I live in the rural outskirts of Harpers Ferry, just a few miles from where Elk Run empties into the Potomac. All of the homes in this area require wells. If the underground streams are contaminated then the value of these homes will be worthless. This area is a beautiful mix of farms, small developments and individual homes. Not having clean water sources for the wells would devastate this area.

Sincerely,

Diana Lynn Shuff

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would negatively affect tourism, economic agility, groundwater quality, and individual health in neighboring municipalities like Shepherdstown. In doing these things the industry that this zoning change provides for will adversely affect the health, safety, and welfare of our community.

Tourism is critically important to Shepherdstown's economy and to the county as a whole. In 2018, tourist spending in the Jefferson County contributed over \$170 million to state and local government revenue and \$213 million in individual earnings. Importantly, most of this money comes from tourists visiting from neighboring states like Virginia, Maryland, and Washington D.C. Out-of-state tourists are largely drawn to Jefferson County because of its reputation for environmental-friendly, sustainable industry. Key elements that support this reputation include the county's pastoral scenery and pristine natural resources. Ordinance #2017-302 will allow industry into Jefferson County that risks harming these elements and dramatically reducing the area's appeal to visitors. The resulting harm to our tourist industry would drive away visitors and decrease state, county, and local revenue. The long-term success of Jefferson County's tourism industry is dependent on local governments making coordinated zoning decisions. Allowing certain types in industry in Ranson will negatively affect tourism in every municipality throughout the county, including Shepherdstown. Voting no on ordinance #2017-302 will protect the foundations of the county's tourism industry and protect the 7,040 jobs in Jefferson County that are directly supported by tourism. In this way, the industry this zoning change will allow will adversely affect the welfare of our community.

The type of large, consolidated industry that ordinance #2017-302 would allow in Ranson would generally reduce the flexibility of local economies in Jefferson County. Historically, the driving industries in Jefferson County have been tourism, agriculture, and the equine industries. These three industries are large conglomerates of small businesses. Small business is very important

to Shepherdstown. Small businesses have been shown to create more jobs, cultivate more innovation, and provide more opportunities than big, non-local firms. Additionally, small businesses have been shown to be more reactive to sudden changes relative to manufacturing businesses. Bringing large, manufacturing-based industry into Jefferson county will depress the local economy and stifle innovation. During this time of economic upheaval and uncertainty, Jefferson County needs to support industries that will allow local economies to adapt and recover as fast as possible.

Voting no on ordinance #2017-302 will help protect water resources throughout Jefferson County. The type of industry that ordinance #2017-302 would allow puts the ground resources of Jefferson county at significant risk due to the karst hydrogeology. The site in Ranson is in the Rocky Marsh Run watershed, which is in the source water protection zone for Shepherdstown and drains to the Potomac River. Therefore, activity at this site will affect both groundwater and surface water streams. In municipalities like Shepherdstown, many residents and nearby farms depend on wells for water. Contamination of groundwater aquifers would create both health and remediation concerns for local residents. Dye tests performed by the USGS near the area of proposed rezoning in Ranson have shown just how far-reaching groundwater contamination at the Ranson site could be. Results from the USGS study revealed measurable dye concentrations in Elk's Run, Rattlesnake Run, and even the Shepherdstown Town Run. This last run cuts through the center of Shepherdstown and is a favorite area for children to play and learn to fish. In this way, the industry that this zoning change will allow will adversely affect the safety of our community.

Groundwater pollution is not the only concern for communities like Shepherdstown. The type of industry that ordinance #2017-302 would allow in Ranson would also generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. These pollutants are particularly harmful to children. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. The site in Ranson is across the road from an elementary school and also within the Jefferson High Middle district. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of children in Shepherdstown and all of Jefferson County. In this way, the industry that this zoning change will provide for will adversely affect the health of our community.

I again request that you vote no on ordinance #2017-302. This zoning change will allow industry that will adversely affect the health, safety, and welfare of our community. The long-term economic, environmental, and community health of municipalities like Shepherdstown depend on Ranson's participation in a coordinated zoning plan for all of Jefferson County.

Sincerely,

Susan Yost

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Debra Smith

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on Ordinance #2017-302. Ranson's proposed zoning change presents a significant risk to the equine industry in Jefferson County and well beyond. The type of industry that would be allowed by the proposed zoning change in this location would jeopardize horse health, the ground water supply, and workforce productivity. This will cause immediate shrinkage and threaten the long-term viability of the equine industry in the county. In doing so, the industry this zoning change will allow for will adversely affect the health, safety, and welfare of our community.

The site of the proposed rezoning is less than six miles from Charles Town Races, with several breeding, training, and rehabilitation facilities between the two. The industry allowed by this rezoning would produce particulate, gaseous, and hazardous air emissions that would reach these sites. According to the WVDEP air permit, the Rockwool plant in Ranson is permitted to emit 250.87 tons of particulate matter per year into the air (1).

According to a recent study published in the journal of Veterinary Internal Medicine (2), horses are 15 times more sensitive to inhaled particulate matter than humans. Inhaled particulate matter can cause inflammation in horses' lungs that negatively affects performance. Inhaled particulate matter also contributes to the development of inflammatory airway disease (IAD) (3). IAD is a chronic airway disease that can affect horses long after their racing career is over. While there is little research on how other air pollutants affect horses, the effects of pollution on humans can be used to infer potential impact on horses. However unlike human models, these horses are elite athletes continuously exposed, and will thus likely experience detrimental effects at much lower levels of air pollution than humans.

The primary concern with air pollution is that increased levels of pollutants will increase inflammation in horses' lungs. Even small, subclinical amounts of inflammation in the lungs of horses negatively affect performance (2,3,4,5,6,11). This inflammation can also cause increased

recovery times following racing (7,11). Reduced performance and training interruptions can lead to higher risk of injury, reduced winning average, fewer yearly starts, lower yearly earnings, shortened career length, fewer lifetime starts, reduced lifetime earnings, and reduced quality of life (2,3,8,9,11). Each of these situations will lead to decreased return on investment, decreased cash flow, and decreased overall earnings for owners, trainers, and breeders with horses at Charles Town Races and in nearby areas. In this way, the industry this zoning will allow will adversely affect the welfare of our community.

While racing is usually a thoroughbred's first career, it is rarely their last. Some racing horses go on to be breeding stock, while others will have successful careers as sport horses. Jefferson County is an important source of new stock for sport horse trainers from Northern Virginia, and Maryland, and this is a resource for local horseman of both income and placement for horses not appropriate for breeding. However, if retired racehorses are unsound from injury or respiratory disease, they can be difficult to manage as breeding stock or unfit for a career as a sport horse. This affects the horse's quality of life and also places a burden on the industry locally and regionally. In this way, the industry this zoning will provide for will adversely affect the welfare of our community.

The perception of decreased air quality from the increase in regional haze and visible smokestacks as one drives into the county will deter out of state Owners and Breeders from investing in West Virginia bred Race horses, decreasing or eliminating a critical \$50 million a year source of local business volume. In this way, the industry this zoning will provide for will adversely affect the welfare of our community.

Another concern related to the proposed rezoning in Ranson is the risk of groundwater contamination as a result of the karst hydrogeology at the site and the industrial activity. Horsemen will either have to take on the expense of periodically testing water sources or they may not know local ground water is contaminated until their animals are sick. Veterinary care and testing adds expense and uncertainty to an industry that already deals with large inherent risks. The actual occurrence of ground water contamination would be devastating for Jefferson County's equine industry. For both geographic and financial reasons, it is simply impossible to think that the industry could solely use public or private utility-provided water if industrial activity fouled the local groundwater. In this way, the industry this zoning will provide for will adversely affect the health, safety, and welfare of our community.

Finally, studies on US agricultural workers have demonstrated that increased air pollution decreases productivity of outdoors workers. This would place an additional burden on workers, small business owners and the industry. In this way the industry this zoning will provide for will adversely affect the health, safety, and welfare of our community.

The equine industry in Jefferson County is hundreds of years old. It is not worth risking this historic and economically valuable industry by rezoning for industrial companies like Rockwool. An economic impact study of the Charles Town Thoroughbred Horse Racing Industry on Jefferson County's economy found that the spending by owners, breeders, and trainers of the

equine industry directly contributes \$79.4 million to the county each year. Out-of-state owners, breeders, and trainers spend more than \$50 million in Jefferson County every year. The value of total business volume in Jefferson County is \$191 million each year (10). These numbers do not include the effect of the handle or the casino.

The equine industry provides jobs for a broad cross-section of the public. This industry offers individuals of any educational background a variety of paths to achieve a good middle-income living. Many jobs allow individuals to pursue apprenticeships or on-the-job training rather than requiring a costly college education. This flexibility allows for greater lifetime earnings and improved educational debt-to-earnings ratio for these workers. The equine industry also provides opportunities for non-traditional workers by offering job opportunities to those who may not be employable by larger corporations. This industry provides a variety of fulltime, part-time, flexible, and pick-up work. Encouraging this type of flexible job ecosystem helps create a healthy economy with broad participation in employment and consumption.

The equine industry is a large conglomerate of small businesses, which have a multitude of economic benefits over having a few large businesses. It has been extensively reported that small locally owned businesses and start ups create more jobs, cultivate innovation, generate higher incomes, and provide more opportunities for individuals that would otherwise not exist than big non-local firms, which can actually depress local economies. The equine industry provides opportunities for small businesses and startups responsible for this growth of better jobs that are so good for the economy.

The equine industry offers so many other benefits that the industry in the rezoned area would not. For example, the equine industry supports local agriculture by providing a market for agricultural goods such as straw. The robust straw market supported by owners, trainers, and breeders allows for a third cash crop to be produced from one field in a year. Through pastureland and support of local agricultural goods, the equine industry protects and preserves the open spaces that give our county its bucolic quality and help attract tourists. Through the breeders' incentive programs, the equine industry offers unique opportunities to draft state funds back to Jefferson County, to name a few.

Rezoning this area of Ranson for Special District Industrial will allow in entities whose activities are harmful to the equine industry. The losses incurred by the equine industry would far outweigh any benefits derived from industries occupying the rezoned area. Sacrificing the long-term viability of one of our oldest and most productive industries for a net loss in business volume and economic value just does not make good sense for the local economy. This zoning change would provide for industry that would adversely affect the health, safety and welfare of our communities. Please vote NO on Ordinance #2017-302.

Sincerely,

Randi Joslyn

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Frank Manuel

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask that you vote no on Ordinance #2017-302. While not in Ranson, the land and homes around the property that is the subject of the zoning change are closer to the property than anyone who currently lives within the city limits of Ranson. This area will be affected sooner and more harshly by the environmental issues that will develop secondary to the inappropriate siting of industry this zoning would allow.

The subject land has been well studied by Drs. Kozar, Doctor and Doctor and described in the scientific literature and USGS reports as having karst hydrology with very high aquifer vulnerability. The karst landscape is a consequence of the presence of soluble bedrock, which consists of limestone in the case of the subject land. In such landscapes water percolates through the ground and dissolves the underlying rock creating a porous network of caverns and throughways. Karst aquifers are known to be "extremely vulnerable to pollution" due to direct connection between the surface water and groundwater through both point (sinkholes) and diffuse (everywhere) infiltration. It is known from the Voluntary Remediation Plan of Jefferson Orchard that the groundwater at the subject site is only 60 feet below the ground. The subject property and much of the property around it are on an upland plain with few surface streams, but great seasonal variability in the water table resulting in numerous esteves and large amounts of water in the epikarst. This water is easily contaminated and this contamination spreads quickly throughout the aquifer. Dye tests performed near the subject site by the USGS have demonstrated this quick moving thorough dispersment in the aquifer in this area. While this contamination goes on to affect springs at the margins of the upland area continuing on in streams that service municipal water sources and the Potomac River, our concerns are far more immediate in both time and distance. Well water is the only water source available in the area of the proposed zoning change and, with the exception of Fox Glen, a majority of this water is supplied by private wells. Therefore, the groundwater aquifer fulfills a critical necessity, fulfilling all needs including human consumption, household uses, and agriculture and

maintenance of livestock and horses in the immediate area around the site. The concern is that if the aquifer becomes contaminated, then the local drinking water will be fouled.

For decades now, policy makers have been using “Aquifer Vulnerability,” to set land use and water resource protection policy. Karst has very high Aquifer Vulnerability. Therefore, this industrial use is not appropriate for this land and it should not be zoned for it. The guiding documents of the WVDEP recognize this. The introduction to the WVDEP document Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.”

The Chesapeake Bay Stormwater Network karst stormwater guidance document the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed, which the WVDEP cites in its own guiding document Stormwater Management Design in Karst Areas, clearly agrees stating:

“First, the effect of land development on karst terrain is complex and hard to predict, and requires professional analysis to reduce the risk of geological hazards, damage to infrastructure and groundwater contamination.” “The working group acknowledges that past approaches to stormwater and land development in karst terrain have been inadequate to safeguard the public and the environment.” “...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” We clearly need stronger comprehensive land use plans and zoning that direct new growth away from karst areas to more appropriate locations. Ordinance #2017-302 is literally the opposite of this.

Further, we cannot rely on the WVDEP to do the job that good local land use guidelines and zoning should do. For example, the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed states that detention and retention ponds are not recommended on karst and categorize them as discouraged. Also, quoting WVDEP’s own karst guidance: “attenuating surface runoff will increase the rate of sinkhole formation and potential groundwater contamination.” Yet the entity currently planning to utilize this zoning change is planning employment of multiple massive retention ponds and attenuating surface runoff completely. This has already been approved by the DEP in two Construction Stormwater General Permit registrations for that company. One of detention ponds is not even regulated by the DEP as it contains process water and has no outlet. Clearly the DEP recognizes the risks but is not appropriately limiting them. Relying on the DEP to protect the public health, safety, welfare, and the environment from any entity in these karst locations is simply as the CNS bulletin said it “inadequate to safeguard the public and the environment.” We must have appropriate zoning that takes into consideration appropriate use of land with karst hydrogeology. Ordinance #2017-302 does not do this, but instead increases the risk to the public and the environment.

A second serious concern is the air emissions from the industry that this zoning will provide for. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. These types of air emissions have been shown to increase the risk of, contribute to, and exacerbate a multitude of developmental, physical, physiological, physiological, cognitive and economic. The exposure of one individual can cause repercussions in multiple generations. Embryos, fetuses, and children are most vulnerable with effects born out over a lifetime, and that of their offspring. Many of these effects only require short-term exposure and some have even been shown to occur at levels below current limits recommended by the World Health Organization. One example of this is that a recent study found that “Even within the limits set by the World Health Organization, the pollutants PM₁₀, SO₂, NO₂, and O₃ are associated with increased risk of treatment for respiratory diseases in children 0 to 6 years of age.” Unfortunately, the US limits are higher than WHO, 300 % higher in the case of PM₁₀!

In fact, in 2019, in the Advice from the Independent Particulate Matter Review Panel (formerly U.S. EPA Clean Air Scientific Advisory Committee Particulate Matter Review Panel) on EPA’s Policy Assessment for the Review of the National Ambient Air Quality Standards for Particulate Matter, it stated that the committee unanimously and unequivocally found that the current primary annual and 24-hour PM_{2.5} National Ambient Air Quality Standards (NAAQS) are not adequate to protect public health. The advice from this 20-member committee, whose scientific disciplines include epidemiology, medicine, toxicology, air quality measurement, air quality modeling, exposure assessment measurement and modeling, risk assessment, statistics, and others, was ignored due presumably to political pressure. Not only are the NAAQS too high in some cases, but due to the measure and mechanism by which they work, they can not replace the safety provided by good land use and zoning regulations, that are meant to do things like keep factories with air emissions and hundreds of heavy trucks away from elementary schools. In fact, there is a state law that prohibits siting a school near a factory. Unfortunately, the reciprocal law does not exist. Clearly, just like with the water resources, we cannot rely on the DEP or the EPA to do the job of what appropriate zoning should do. The whole point of zoning is to keep people safe and provide for their health and welfare. Ordinance #2017-302 puts families and school children directly in harms way.

The air emissions, threat to the groundwater, and the very presence of the industry that this zoning change will allow for will have a serious negative economic effect on those who live and or work closest to the site in question. Productivity and workforce participation will be negatively affected by the health effects of the air emissions. The local agricultural operations will be negatively affected by the air emissions with lower quantity and quality of crop yield and would be devastated if the ground water aquifer were fouled. The equine operations in the area, of which there are several, will be negatively affected by the air emissions as they affect the horses’ health and performance. The mere presence of the industry that will be provided for by this zoning change will cause property values to fall. There will be serious economic consequences for the immediate area around the site in question.

Several of the communities in the immediate area of the site for proposed zoning change are traditionally underserved and have lower economic status. The choice of this location for such a zoning change represents an egregious example of environmental injustice that should not be promulgated or tolerated.

This zoning change will provide for industry that will negatively affect the health safety and welfare of our community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Frank Manuel

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would put at risk the health and well being of children of Jefferson County.

The type of industry that ordinance #2017-302 would allow in Ranson would generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. Exposure to these pollutants has devastating effects on children's health. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. Developing fetuses whose mothers are exposed to air pollution are more likely to have impaired organ development which can lead to early cognitive deficits, neurodevelopmental defects and other physical, cognitive, and psychological deficits later in life. An association between autism and prenatal exposure to particulate matter in air pollution has been demonstrated in several studies. Many studies have shown that lower test scores in math, English, and language arts are associated with exposure to outdoor air pollution. Industrial activity allowed by ordinance #2017-302 would also increase the risk of groundwater contamination in Ranson and nearby municipalities. Children whose families rely on well water, as is the case in much of Jefferson County, may be affected by polluted water. Voting no on ordinance #2017-302 will prevent air and water pollution from negatively affecting the long-term health of children in Jefferson County and surrounding areas.

The economic and environmental harm caused by the type of industry that ordinance #2017-302 would allow would put additional stress on the parents, caretakers, and teachers of children in affected areas. The weakening and destabilizing of this support network would have negative effects on local children. Many households in Jefferson County depend on the local agriculture, tourism, and equine industries for income. If industrial activity in Ranson depresses these industries, the resulting financial strain on these households will introduce additional stress and uncertainty into children's lives. Households living in areas affected by particulate

matter and regional haze will also suffer from the psychological effects of air pollution. Individuals living in areas with increase perception of pollution show increased levels of stress, anxiety, and unhappiness. School districts affected by increased air and water pollution may have trouble recruiting and retaining teachers. Teachers have a large influence on a child's daily life and, if educator quality and tenure decreases, the quality of this influence will diminish.

The site of the proposed rezoning in Ranson is across the road from an elementary school and proximal to lower-income neighborhoods. Observations like these demonstrate how ordinance #2017-302 would disproportionately affect vulnerable and historically-disadvantaged populations. The damaging health effects of air pollution have been shown to persist for at least three generations, so allowing certain types of industry in low-income areas would only compound existing disadvantages. Voting no on ordinance #2017-302 would be a step towards acknowledging that all individuals have the right to clean air and water.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." This zoning change would clearly adversely affect the health, safety, and welfare of the community. Children face increased exposure to air pollution adversely affecting their health, financial instability adversely affecting their welfare, groundwater contamination adversely affecting their safety, and environmental injustice and discrimination if ordinance #2017-302 is passed. Educators will face increased air pollution adversely affecting their health and consequently welfare. These adverse effects are all against Ranson's Comprehensive Plan. Please vote NO on Ordinance #2017-302.

Sincerely,
Amanda R. H. Lewis

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would have a negative effect on water and air quality in neighboring states such as Maryland.

The Potomac River provides drinking water and a source of recreation to Maryland residents. Water and air pollution generated within the Potomac River's watershed will inevitably contaminate this valuable waterway. The site of the proposed zoning change in Ranson is located within the Potomac River Watershed.

The type of industry that ordinance #2017-302 would allow in Ranson would utilize large water impoundments, in an area of known karst terrain. This water will be contaminant from several sources including particulate mater that has fallen out from the air emissions and process water. The West Virginia Department of Environmental Protection has published guidelines that specifically discourage extensive development in areas of karst terrain because of the vulnerability of karst aquifers to contamination by surface pollution. Karst features increase surface water and groundwater connectivity and any spills or surface releases quickly percolate into the groundwater. Additionally, sinkholes are common in karst terrain and can cause ruptures in wastewater impoundments. Even if appropriate attempts are made to contain and manage wastewater and other stormwater runoff on-site, there is still a high risk that wastewater could contaminate the groundwater through tears and catastrophic failure of wastewater impoundments. Contaminated groundwater in karst terrain can easily resurface in waterways several miles away, as shown by a USGS tracer study conducted near the site in to be rezoned. The USGS study detected tracer dye in multiple springs and waterways miles from the initial injection site in Ranson. All of these waterways drain into the Potomac River.

Mismanagement of wastewater could also lead to contamination of nearby surface waters. For example, the site of the proposed rezoning in Ranson is in the Rocky Marsh Run watershed.

Rocky Marsh Run also drains to the Potomac River. Voting no on ordinance #2017-302 will preserve downstream water quality and help ensure that the Potomac River remains usable for Maryland residents.

Air pollution poses another risk to Maryland residents. The type of industry that ordinance #2017-302 would allow would generate air pollutants like fine particulate matter. According to the US EPA, fine particulates can travel 100s of miles from its original source. Air pollution related to industrial activity in Ranson could easily reach Maryland. Fine particulates have a greater affinity for carrying toxic compounds and their small size allows them to be inhaled more deeply into the lungs. Chronic exposure to fine particulate matter is associated with increased risk of several diseases including Alzheimer's in adults. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease among others. Fine particulate matter also exacerbates regional haze which creates a visible reminder of air pollution. The psychological effects that arise from an increased perception of pollution include stress, anxiety, and unhappiness. Voting no on ordinance #2017-302 will help prevent increased air pollution from negatively affecting the long-term health of Maryland residents.

The industry that this zoning will provide for will threaten the health, safety, and welfare of the residents in Maryland, and this land is not well-suited for industrial use. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." To achieve this, the council must not approve this proposed zoning change.

I again request that you vote no on ordinance #2017-302. Zoning decisions in Ranson and Jefferson County have an undeniable influence on the quality of life in neighboring states.

Sincerely,

Sandra Arndt-Kohlway

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Heather Zehfuss

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. While I am a current resident of Maryland, I was looking forward to moving to Jefferson County by the end of this year, however I have serious concerns about the environmental effects. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the

health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I am an educator (behavior analyst) working with children impacted by developmental disabilities and I respectfully request that you vote NO on Ordinance #2017-302. This rezoning will put an undue hardship on the wastewater treatment systems, burden the rate payers and risk surface waterways in Charles Town, risking the health, safety and welfare of the community. The comprehensive plan of Ranson states, the City "will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community." Therefore, please vote NO on #2017-302.

The nature of the industry that this zoning will allow will be harmful to our local economy. Charles Town has spent a lot of time and money improving our downtown area for restaurants and retail. We are working to take advantage of the tourism industry in our county and bring more people into Charles Town. The eye sore, noise pollution, air pollution, and obvious move away from sustainability will drive people away from Jefferson County and Charles Town, rendering our efforts ineffective and unrewarding. This will make it harder for our small businesses to be successful. In this way, the industry this zoning will provide for will adversely affect the welfare of our community.

According to the 2018 WVU economic study of the eastern panhandle, over 40% of the workforce in Jefferson County choose to work outside of the state. These commuters bring that money home and spend it here supporting our local small businesses, economy and government. Charles Town has a large number of residents who commute. These typically higher earners may choose to leave the area because of the presence of the industry that this zoning change would provide for. This will cause a hardship on our economy and municipality. In this way, the industry this zoning will provide for will adversely affect the welfare of our community.

The industry that this zoning will allow will cause stress for multiple reasons on the Charles Town wastewater treatment systems and the surface waterways in Jefferson County and beyond. The industry currently planning to utilize the zoning change will have discharge to the wastewater system that is high in chloride, primarily from its water softening system. The NPDES permit modification allows up to 5,000 mg/L. Chloride is not settled or removed at the wastewater treatment plant. It cannot be removed by conventional means and would be prohibitively expensive to do by new technology. This is of concern to Charles Town because chloride can harm stream water and also impair functioning of the wastewater treatment plant. Furthermore, the corrosive nature of chloride can cause damage to pipes both in the wastewater system and those used by downstream drinking water systems, like the \$207 million Trap Rock Water Treatment plant in Loudoun.

The human health criteria for chloride under WV standards is 250 mg/L. Under low stream flow conditions, chloride additions to the treatment plant effluent, as proposed by the industry currently planning to utilize the zoning change, could cause chloride levels in Evitts Run to exceed this standard. If the amount of chloride increased due to expansion or higher throughput, then this human health standard would be violated frequently. Chlorides are also known to harm aquatic life and effect metal toxicity in rivers. The USEPA and several states have surface water guidelines of 230mg/L for chronic exposure. This would also pose a risk of damaging the water treatment facilities downstream on the Potomac River.

A research study by Lefebvre and Moletta in 2006 showed that chloride and salinity impair the ability of wastewater treatment to remove phosphorus and nitrogen, and because of this, other states have introduced legislation to treat saline wastewater. Uygur and Kargi in 2004 looked at the effects of salt on synthetic wastewater treatment. They found that removal of both nitrogen and phosphorus was reduced when salinity increased from 0 to 6%. In fact, the removal efficiency of ammonia dropped from 96% to 39% with this increasing salinity. Hong et al. In 2016 found phosphorous removal decreased 20-28% when chloride concentrations went from 150 mg/L to 1,500 mg/L. Phosphorous removal was completely inhibited at concentrations greater than 2,500 mg/L. This increased salinity has the potential to make the Charles Town wastewater treatment system work far less efficiently.

In addition to the contents of the wastewater this type of industry will produce, the volume of sewage is itself a concern. Given that the City of Charles Town has been in violation of its permit on numerous occasions for spills and overflow of untreated sewage, adding large volumes of wastewater will further challenge the near capacity system. This will mean that costly capacity upgrades will need to be done likely sooner than they would have needed to be done, imposing further financial strain on the system. Through these effects, the industry this zoning will provide for will adversely effect the health, safety, and welfare of the community.

This zoning change will provide for industry the likes of which are not present in this county and have not been present in this county for many decades. We find it appalling that the introduction of zoning for such industry is being done in an area of the county that is historically underserved and lower income. It is even more egregious because the worst effects including

air pollution and groundwater contamination will be felt first and most severely in the immediate vicinity, and Ranson does not even have residents in the immediate vicinity of the proposed zoning change. This decision is being contemplated without representation of those who will be most affected. This would be a deplorable example of environmental injustice.

This zoning will provide for industry that will harm our economy, drive away residents, challenge and or damage our infrastructure, and may damage our waterways and wild life. Through these effects, the industry this zoning would allow will adversely effect the health, safety, and welfare of our community. This is being done with out representation of those it will affect the most. Please vote No on Ordinance #2017-302.

Sincerely,

Lynn Sparling

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that will significantly harm the municipalities within Jefferson County and beyond effecting the health, welfare, and safety of our community. Harpers Ferry is a national treasure with the natural and historic resources tours flock to see each year and one of the communities that will be negatively impacted by this zoning change.

According to a 2019 study by the West Virginia Tourism Office, Jefferson County generated an average of \$178 million per year in tourism-derived revenue for state and local governments over the last 10 years, more than any other county in West Virginia by at least double. Tourism benefits the businesses and economy of Ranson and Jefferson County producing \$213.7 million in individual earning, 7040 jobs, and \$842.6 million in direct spending here in 2018. We would need 40 Project Shuttles to replace the individual earnings and 59 Rockwools to replace the jobs provided by the tourism industry in Jefferson County. It is important to note that most of the money generated by tourism in Jefferson County comes from neighboring states. In this way, it is like an export: not simply recycling money, but bringing money into the state increasing its wealth. Much of the economy in Harpers Ferry is based on this tourism industry. A threat to this industry poses a threat to the economy and welfare of our community.

One of the important drivers for tourism in Harpers Ferry is the Appalachian Trail. According to the Appalachian Trail Conservancy (ATC), Harpers Ferry is the psychologic midpoint of the Trail, and hikers often plan extended stays in Jefferson County with an obvious positive impact. The ATC reports that the smokestacks and associated lights will be visible in the viewshed of 15 vistas on the Appalachian Trail (AT). Studies have shown that quality of vistas and human impact on the environment are not only noticed by visitors, but effect their experience. Another study published in the Journal of Applied Recreation Research, found that points of interests and views drew visitors' attention and had a significant impact on their perception of the trail. It was also found that particularly beautiful vistas helped visitors overlook elements

that usually have a negative effect on trail experience like increased trail traffic. A 2009 study in Leisure Sciences revealed that scenic value was a perceptual theme of Appalachian Trail visitors, and that things as simple as dead trees visible in a vista can have a negative impact on visitors' overall perception. Imagine the effect the smokestacks will have from the 15 vistas from which they will be visible. The introduction of industrial activity made possible by the proposed rezoning in Ranson would have a negative effect on the scenic views of beautiful landscapes from the Appalachian Trail in Jefferson County.

The smokestacks are not all visitors will be able to see — the air pollution will create haze. The effect of regional haze on tourists was explored in a review article published in the Atmospheric Environment titled "Impaired visibility: the air pollution people see." A key takeaway on the negative affect of haze on vacationing tourists was summarized as follows:

"Vacations offer an escape from the routine and stress of our daily lives. Vacation destinations are often chosen based on their scenery; vacations are spent gazing at monuments, mountains, clouds, and oceans. Good visibility allows clear observation of distant features and appreciation of the inherent beauty of these scenes...Air pollution, which is often present in both our cities and parks, interferes with these attributes and can ruin the views vacationers travel to enjoy."

People seek bucolic, unspoiled areas to escape the stresses of urban areas. A 2004 study in Environment and Behavior found perceived pollution causes stress while viewing natural scenes has both psychological and physiological benefits, and a 2007 study confirmed these benefits. Two other studies found that people are emotionally affected by poor visibility, and tourists are disappointed when views are obscured by haze.

The combination of smokestacks and haze will mar the viewshed and will not only reduce the positive effects of a scenic landscape but also leave tourists disappointed and dissatisfied with their choice of destination. With these effects the welfare of the Harpers Ferry community would undoubtedly be endangered by the industry that this zoning change will provide for.

Multiple studies by doctors Kozar, Doctor, and Doctor have demonstrated that the land at this site to be rezoned is Karst with the highest likelihood of sinkhole development in the county, and that the groundwater aquifer there is incredibly sensitive to contamination from surface water. Further, this site is on an upland plain with relatively few surface streams, seasonal variability in the water table that results in numerous estavelles, and large amounts of water in the epikarst. In this area contamination in surface water communicates easily to the water in the epikarst via diffuse and point infiltration, and the springs at the margins of the upland area are directly affected by the water quality throughout the aquifer. According to Jefferson Orchards Voluntary Remediation Plan with the WVDEP, the groundwater at the site is approximately 60 feet below the ground, and the tests performed by the USGS have shown that groundwater from just adjacent to this site emerged in the headwaters of both the Elk's Run and Rattlesnake Run. This is critically important for Harpers Ferry because the Elk's Run headwaters is a spring about three miles southeast of the site and goes on to become the drinking water source for Harpers Ferry and Bolivar before emptying into the Potomac River.

The headwaters of Rattlesnake Run is a spring about 3.5 miles from the site and is also a tributary of the Potomac River. The Potomac River is the back up water source for Harpers Ferry. This means that the activity at the site will have a critical influence on the drinking water of Harpers Ferry. In this was the industry permitted by this change in zoning would undoubtedly endanger the health and safety of the community in Harpers Ferry.

The untoward health effects and individual economic consequences from the pollution emissions of the industry this rezoning will allow that will be born out over the length of people's lives and that of their decedents for at least three generations is an egregious example of environmental injustice that should not be tolerated. This zoning change may be in one of the poorest sections of the county, but the effects will be felt in every part of Ranson and the county.

The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." The industry that this rezoning will allow will jeopardize the health, safety and welfare of Ranson, Harpers Ferry and the whole county. Please vote no on the ordinance #2017-302.

Sincerely,

Canne Sakre

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote NO on Ordinance #2017-302. This rezoning will put an undue hardship on the wastewater treatment systems, burden the rate payers and risk surface waterways in Charles Town, risking the health, safety and welfare of the community. The comprehensive plan of Ranson states, the City "will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community." Therefore, please vote NO on #2017-302.

The nature of the industry that this zoning will allow will be harmful to our local economy. Charles Town has spent a lot of time and money improving our downtown area for restaurants and retail. We are working to take advantage of the tourism industry in our county and bring more people into Charles Town. The eye sore, noise pollution, air pollution, and obvious move away from sustainability will drive people away from Jefferson County and Charles Town, rendering our efforts ineffective and unrewarding. This will make it harder for our small businesses to be successful. In this way, the industry this zoning will provide for will adversely affect the welfare of our community.

According to the 2018 WVU economic study of the eastern panhandle, over 40% of the workforce in Jefferson County choose to work outside of the state. These commuters bring that money home and spend it here supporting our local small businesses, economy and government. Charles Town has a large number of residents who commute. These typically higher earners may choose to leave the area because of the presence of the industry that this zoning change would provide for. This will cause a hardship on our economy and municipality. In this way, the industry this zoning will provide for will adversely affect the welfare of our community.

The industry that this zoning will allow will cause stress for multiple reasons on the Charles Town wastewater treatment systems and the surface waterways in Jefferson County and

beyond. The industry currently planning to utilize the zoning change will have discharge to the wastewater system that is high in chloride, primarily from its water softening system. The NPDES permit modification allows up to 5,000 mg/L. Chloride is not settled or removed at the wastewater treatment plant. It cannot be removed by conventional means and would be prohibitively expensive to do by new technology. This is of concern to Charles Town because chloride can harm stream water and also impair functioning of the wastewater treatment plant. Furthermore, the corrosive nature of chloride can cause damage to pipes both in the wastewater system and those used by downstream drinking water systems, like the \$207 million Trap Rock Water Treatment plant in Loudoun.

The human health criteria for chloride under WV standards is 250 mg/L. Under low stream flow conditions, chloride additions to the treatment plant effluent, as proposed by the industry currently planning to utilize the zoning change, could cause chloride levels in Evitts Run to exceed this standard. If the amount of chloride increased due to expansion or higher throughput, then this human health standard would be violated frequently. Chlorides are also known to harm aquatic life and effect metal toxicity in rivers. The USEPA and several states have surface water guidelines of 230mg/L for chronic exposure. This would also pose a risk of damaging the water treatment facilities downstream on the Potomac River.

A research study by Lefebvre and Moletta in 2006 showed that chloride and salinity impair the ability of wastewater treatment to remove phosphorus and nitrogen, and because of this, other states have introduced legislation to treat saline wastewater. Uygur and Kargi in 2004 looked at the effects of salt on synthetic wastewater treatment. They found that removal of both nitrogen and phosphorus was reduced when salinity increased from 0 to 6%. In fact, the removal efficiency of ammonia dropped from 96% to 39% with this increasing salinity. Hong et al. In 2016 found phosphorous removal decreased 20-28% when chloride concentrations went from 150 mg/L to 1,500 mg/L. Phosphorous removal was completely inhibited at concentrations greater than 2,500 mg/L. This increased salinity has the potential to make the Charles Town wastewater treatment system work far less efficiently.

In addition to the contents of the wastewater this type of industry will produce, the volume of sewage is itself a concern. Given that the City of Charles Town has been in violation of its permit on numerous occasions for spills and overflow of untreated sewage, adding large volumes of wastewater will further challenge the near capacity system. This will mean that costly capacity upgrades will need to be done likely sooner than they would have needed to be done, imposing further financial strain on the system. Through these effects, the industry this zoning will provide for will adversely effect the health, safety, and welfare of the community.

This zoning change will provide for industry the likes of which are not present in this county and have not been present in this county for many decades. We find it appalling that the introduction of zoning for such industry is being done in an area of the county that is historically underserved and lower income. It is even more egregious because the worst effects including air pollution and groundwater contamination will be felt first and most severely in the immediate vicinity, and Ranson does not even have residents in the immediate vicinity of the

proposed zoning change. This decision is being contemplated without representation of those who will be most affected. This would be a deplorable example of environmental injustice.

This zoning will provide for industry that will harm our economy, drive away residents, challenge and or damage our infrastructure, and may damage our waterways and wild life. Through these effects, the industry this zoning would allow will adversely effect the health, safety, and welfare of our community. This is being done with out representation of those it will affect the most. Please vote No on Ordinance #2017-302.

Sincerely,

Diane Brown

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

patricia latino

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask you to vote NO on Ordinance #2017-302. The industry this zoning change will allow for endangers the health, safety and, welfare of the community, and violates the premise of the smart code zoning that we have spent so much time, effort and federal money employing.

This zoning change will provide for industry that will negatively affect the agriculture industry in Jefferson County and beyond. The combination of the air emissions and threat to the ground water resources could have devastating consequences for the agricultural community of Jefferson County.

The comprehensive plan of Ranson is clear: it states, "the City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community." This land is ill-suited for an industrial facility due to its location and hydrogeology. Further, the industry that this zoning change will allow for will adversely affect the health, safety, and welfare of the community through its affect on the agricultural industry.

The agriculture industry in Jefferson County is hundreds of years old and continues to serve our community well today. According to the economic impact study "A Shared Agenda for Growing West Virginia's Agricultural Economy, Prepared by Fourth Economy for West Virginia Department Of Agriculture West Virginia University Extension Service 2012," Jefferson County is the second highest producing county for crops sales, third highest for fruits and vegetables sales, and in the top 9 counties for sales of animals and animal products.

Agriculture, tourism and the equine industries work synergistically to have an outsized positive impact on the economy in Ranson and Jefferson County as a whole. Agriculture drives tourism by creating agro-tourism opportunities, preserving beautiful open spaces that contribute to the

bucolic nature of our county, and providing the locally produced agriculture goods many tourists are look for in our markets and restaurants. Agriculture also supports the equine industry by providing local products like hay and straw, helping maintain pasture land, co-supporting local dual-purpose retail stores, and helping recycle by products. Agriculture helps maintain the way of life that many those who choose to live in Jefferson County enjoy. Industrial manufacturing and industry this zoning will provide for could never achieve these things.

Local agriculture also provides a source of locally produced agricultural goods. It has become apparent with the current pandemic and health emergency. This became a supply chain crisis because as our supply chains have moved to be ever more lean and efficient they lack resiliency and agility. By having a local source of agricultural goods and food we add resiliency and agility into our own economy and community. The agricultural industry in Jefferson County provides this.

A plethora of scientific studies have shown that a variety of air pollutants produced by the type of industry this zoning change would provide for causes decreased yields of both quantity and quality for several of the crops important to Jefferson County including winter wheat and soybeans. Soybeans and wheat are two of the crops significantly affected and two of the most prevalent crops in Jefferson County. Lower crop yields harm the farms and all the members of the down stream supply chain as well as the consumer. In this way, this zoning change will adversely affect the welfare of the community.

Recent studies have shown that even small increases in air pollution affect the productivity of agricultural workers. Similar to the reduction in crop yield this will negatively affect the individual workers, businesses, consumers and industry as a whole. In this way, this zoning change will adversely affect the health and welfare of individuals and the community.

Even more devastating is the possibility of groundwater contamination. The land at the subject location has karst hydrogeology and as such has porous bedrock and severe ground instability problems. The porous bedrock allows rapid diffuse infiltration of surface water into ground water and the severe ground instability problems leads to sinkhole development. Sinkholes provide direct connection of the surface water with the ground water aquifer through point infiltration. In fact, according to a 2012 study by Doctor and Doctor, the subject location and that of Terrapins Neck have the highest sinkhole vulnerability of any sites in Jefferson County. The propensity and easy of diffuse and point infiltration in areas of karst hydrogeology give them very high aquifer vulnerability meaning the aquifer is very vulnerable to contamination. For this reason, this measure has been used for decades by policymakers to set land use regulations. In this way, this zoning change and the industry it will provide for will adversely affect the welfare of the community.

The WVDEP recognizes development in car karst areas puts water resources high-risk for contamination but also recognizes that this is best protected against true local land use and zoning ordinances. WVDEP's guiding document Stormwater Management Design in Karst Areas

states, "it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." This document also references the Chesapeake Bay Stormwater Network karst stormwater guidance document the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed. In which it states "...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." Land use policy in Ranson and zoning need to take aquifer vulnerability into consideration as these agencies and documents suggest.

The Jefferson Orchards Voluntary Remediation Plan application reports that the ground water is only 60 feet from the surface at the site. It is described in the scientific literature that this land is an upland plane with large amounts of water in the epikarst, and contamination of this water effects the whole aquifer including the communications with surface water streams. A USGS study demonstrated that the groundwater adjacent to the site communicates readily with several surface water structures and wells miles away from the site. The effects of contamination at this site would go well beyond Ranson fouling large portions of the ground water and surface water in Jefferson County.

Groundwater contamination at the site would have devastating effects on the Agricultural industry in Jefferson county. For geographic and economic reasons it is simply infeasible for the agricultural industry to rely on utility provided water. Based on the scientific literature the site being considered for rezoning is one of the areas of highest aquifer vulnerability in Jefferson County and is inappropriate for the industry that this zoning change will provide for. This land is clearly ill-suited for industrial use and should not be zoned for it.

By threatening the local agricultural industry, the industry that this zoning will provide for will threaten the health, safety, and welfare of the community, and this land is not well-suited for industrial use. The Comprehensive Plan in Ranson is clear the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Wendy Brown

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

I live in Clarke County and would be subject to not only pollution from the factory but also increased traffic on Rt 340 and other local roads and interstates. I am also very distressed for the residents of Ranson and Charles Town and especially the school age children being exposed to toxic chemicals on a daily basis. Do the right thing and get Rockwool OUT!

Sincerely,

Leyland delRe

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote NO on Ordinance #2017-302. This rezoning will put an undue hardship on the wastewater treatment systems, burden the rate payers and risk surface waterways in Charles Town, risking the health, safety and welfare of the community. The comprehensive plan of Ranson states, the City "will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community." Therefore, please vote NO on #2017-302.

The nature of the industry that this zoning will allow will be harmful to our local economy. Charles Town has spent a lot of time and money improving our downtown area for restaurants and retail. We are working to take advantage of the tourism industry in our county and bring more people into Charles Town. The eye sore, noise pollution, air pollution, and obvious move away from sustainability will drive people away from Jefferson County and Charles Town, rendering our efforts ineffective and unrewarding. This will make it harder for our small businesses to be successful. In this way, the industry this zoning will provide for will adversely affect the welfare of our community.

According to the 2018 WVU economic study of the eastern panhandle, over 40% of the workforce in Jefferson County choose to work outside of the state. These commuters bring that money home and spend it here supporting our local small businesses, economy and government. Charles Town has a large number of residents who commute. These typically higher earners may choose to leave the area because of the presence of the industry that this zoning change would provide for. This will cause a hardship on our economy and municipality. In this way, the industry this zoning will provide for will adversely affect the welfare of our community.

The industry that this zoning will allow will cause stress for multiple reasons on the Charles Town wastewater treatment systems and the surface waterways in Jefferson County and

beyond. The industry currently planning to utilize the zoning change will have discharge to the wastewater system that is high in chloride, primarily from its water softening system. The NPDES permit modification allows up to 5,000 mg/L. Chloride is not settled or removed at the wastewater treatment plant. It cannot be removed by conventional means and would be prohibitively expensive to do by new technology. This is of concern to Charles Town because chloride can harm stream water and also impair functioning of the wastewater treatment plant. Furthermore, the corrosive nature of chloride can cause damage to pipes both in the wastewater system and those used by downstream drinking water systems, like the \$207 million Trap Rock Water Treatment plant in Loudoun.

The human health criteria for chloride under WV standards is 250 mg/L. Under low stream flow conditions, chloride additions to the treatment plant effluent, as proposed by the industry currently planning to utilize the zoning change, could cause chloride levels in Evitts Run to exceed this standard. If the amount of chloride increased due to expansion or higher throughput, then this human health standard would be violated frequently. Chlorides are also known to harm aquatic life and effect metal toxicity in rivers. The USEPA and several states have surface water guidelines of 230mg/L for chronic exposure. This would also pose a risk of damaging the water treatment facilities downstream on the Potomac River.

A research study by Lefebvre and Moletta in 2006 showed that chloride and salinity impair the ability of wastewater treatment to remove phosphorus and nitrogen, and because of this, other states have introduced legislation to treat saline wastewater. Uygur and Kargi in 2004 looked at the effects of salt on synthetic wastewater treatment. They found that removal of both nitrogen and phosphorus was reduced when salinity increased from 0 to 6%. In fact, the removal efficiency of ammonia dropped from 96% to 39% with this increasing salinity. Hong et al. In 2016 found phosphorous removal decreased 20-28% when chloride concentrations went from 150 mg/L to 1,500 mg/L. Phosphorous removal was completely inhibited at concentrations greater than 2,500 mg/L. This increased salinity has the potential to make the Charles Town wastewater treatment system work far less efficiently.

In addition to the contents of the wastewater this type of industry will produce, the volume of sewage is itself a concern. Given that the City of Charles Town has been in violation of its permit on numerous occasions for spills and overflow of untreated sewage, adding large volumes of wastewater will further challenge the near capacity system. This will mean that costly capacity upgrades will need to be done likely sooner than they would have needed to be done, imposing further financial strain on the system. Through these effects, the industry this zoning will provide for will adversely effect the health, safety, and welfare of the community.

This zoning change will provide for industry the likes of which are not present in this county and have not been present in this county for many decades. We find it appalling that the introduction of zoning for such industry is being done in an area of the county that is historically underserved and lower income. It is even more egregious because the worst effects including air pollution and groundwater contamination will be felt first and most severely in the immediate vicinity, and Ranson does not even have residents in the immediate vicinity of the

proposed zoning change. This decision is being contemplated without representation of those who will be most affected. This would be a deplorable example of environmental injustice.

This zoning will provide for industry that will harm our economy, drive away residents, challenge and or damage our infrastructure, and may damage our waterways and wild life. Through these effects, the industry this zoning would allow will adversely effect the health, safety, and welfare of our community. This is being done with out representation of those it will affect the most. Please vote No on Ordinance #2017-302.

Sincerely,

Bob Gerber

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask you to vote NO on Ordinance #2017-302. The industry this zoning change will allow for endangers the health, safety and, welfare of the community, and violates the premise of the smart code zoning that we have spent so much time, effort and federal money employing.

This zoning change will provide for industry that will negatively affect the agriculture industry in Jefferson County and beyond. The combination of the air emissions and threat to the ground water resources could have devastating consequences for the agricultural community of Jefferson County.

The comprehensive plan of Ranson is clear: it states, "the City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community." This land is ill-suited for an industrial facility due to its location and hydrogeology. Further, the industry that this zoning change will allow for will adversely affect the health, safety, and welfare of the community through its affect on the agricultural industry.

The agriculture industry in Jefferson County is hundreds of years old and continues to serve our community well today. According to the economic impact study "A Shared Agenda for Growing West Virginia's Agricultural Economy, Prepared by Fourth Economy for West Virginia Department Of Agriculture West Virginia University Extension Service 2012," Jefferson County is the second highest producing county for crops sales, third highest for fruits and vegetables sales, and in the top 9 counties for sales of animals and animal products.

Agriculture, tourism and the equine industries work synergistically to have an outsized positive impact on the economy in Ranson and Jefferson County as a whole. Agriculture drives tourism by creating agro-tourism opportunities, preserving beautiful open spaces that contribute to the

bucolic nature of our county, and providing the locally produced agriculture goods many tourists are look for in our markets and restaurants. Agriculture also supports the equine industry by providing local products like hay and straw, helping maintain pasture land, co-supporting local dual-purpose retail stores, and helping recycle by products. Agriculture helps maintain the way of life that many those who choose to live in Jefferson County enjoy. Industrial manufacturing and industry this zoning will provide for could never achieve these things.

Local agriculture also provides a source of locally produced agricultural goods. It has become apparent with the current pandemic and health emergency. This became a supply chain crisis because as our supply chains have moved to be ever more lean and efficient they lack resiliency and agility. By having a local source of agricultural goods and food we add resiliency and agility into our own economy and community. The agricultural industry in Jefferson County provides this.

A plethora of scientific studies have shown that a variety of air pollutants produced by the type of industry this zoning change would provide for causes decreased yields of both quantity and quality for several of the crops important to Jefferson County including winter wheat and soybeans. Soybeans and wheat are two of the crops significantly affected and two of the most prevalent crops in Jefferson County. Lower crop yields harm the farms and all the members of the down stream supply chain as well as the consumer. In this way, this zoning change will adversely affect the welfare of the community.

Recent studies have shown that even small increases in air pollution affect the productivity of agricultural workers. Similar to the reduction in crop yield this will negatively affect the individual workers, businesses, consumers and industry as a whole. In this way, this zoning change will adversely affect the health and welfare of individuals and the community.

Even more devastating is the possibility of groundwater contamination. The land at the subject location has karst hydrogeology and as such has porous bedrock and severe ground instability problems. The porous bedrock allows rapid diffuse infiltration of surface water into ground water and the severe ground instability problems leads to sinkhole development. Sinkholes provide direct connection of the surface water with the ground water aquifer through point infiltration. In fact, according to a 2012 study by Doctor and Doctor, the subject location and that of Terrapins Neck have the highest sinkhole vulnerability of any sites in Jefferson County. The propensity and easy of diffuse and point infiltration in areas of karst hydrogeology give them very high aquifer vulnerability meaning the aquifer is very vulnerable to contamination. For this reason, this measure has been used for decades by policymakers to set land use regulations. In this way, this zoning change and the industry it will provide for will adversely affect the welfare of the community.

The WVDEP recognizes development in car karst areas puts water resources high-risk for contamination but also recognizes that this is best protected against true local land use and zoning ordinances. WVDEP's guiding document Stormwater Management Design in Karst Areas

states, "it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." This document also references the Chesapeake Bay Stormwater Network karst stormwater guidance document the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed. In which it states "...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." Land use policy in Ranson and zoning need to take aquifer vulnerability into consideration as these agencies and documents suggest.

The Jefferson Orchards Voluntary Remediation Plan application reports that the ground water is only 60 feet from the surface at the site. It is described in the scientific literature that this land is an upland plane with large amounts of water in the epikarst, and contamination of this water effects the whole aquifer including the communications with surface water streams. A USGS study demonstrated that the groundwater adjacent to the site communicates readily with several surface water structures and wells miles away from the site. The effects of contamination at this site would go well beyond Ranson fouling large portions of the ground water and surface water in Jefferson County.

Groundwater contamination at the site would have devastating effects on the Agricultural industry in Jefferson county. For geographic and economic reasons it is simply infeasible for the agricultural industry to rely on utility provided water. Based on the scientific literature the site being considered for rezoning is one of the areas of highest aquifer vulnerability in Jefferson County and is inappropriate for the industry that this zoning change will provide for. This land is clearly ill-suited for industrial use and should not be zoned for it.

By threatening the local agricultural industry, the industry that this zoning will provide for will threaten the health, safety, and welfare of the community, and this land is not well-suited for industrial use. The Comprehensive Plan in Ranson is clear the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Darren Long

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Industrial zoning doesn't belong in Jefferson County! We value our clean air and water! That's why people come here. Don't turn us into another WV brownfield!!!!

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive

Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Meredith Adams

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

This land and this location are not appropriate for the industry this zoning change will allow. The hydrogeology of the land combined with such industrial activity risks the safety of our water supply. The air emissions from this industry will negatively impact our physical and mental health, our children's ability to achieve, our ability to make a living, our happiness, and it will do this for generations even after we leave or the pollution stops. The industry this zoning change will provide for will adversely affect the health, safety, and welfare of our community. It is not lost on us that this zoning change is being made next to our neighborhood and not next to the residents of Ranson, yet Ranson is in control. This is not right. We respectfully ask you to vote NO on ordinance #2017-302.

The land at the site in question is not just ill-suited, but completely inappropriate for the industry this zoning change will allow. This land has karst hydrogeology. As such, the ground itself is very unstable and readily develops sinkholes. This land has been described by a 2012 study to be exceptionally susceptible to sinkhole formation, more so than most of the rest of the county. Sinkholes provide point infiltration of surface water into the water in the epikarst. The porous bedrock allows diffuse infiltration of surface water into the epikarst water. At this site, there is also large amounts of water in the epikarst and it is only 60 feet from the surface. This allows the water at the surface to easily communicate with the water in the epikarst and the groundwater aquifer carrying any surface water contaminants with it.

The industrial activity this zoning change will allow for will cause ample surface water contamination from ground level industrial activities, raw material and waste storage and particulate matter falling to the ground from the air emissions. The industry that is currently planning to utilize this zoning change should be designated a stormwater hotspot just for this reason. The WVDEP should require them to treat all water before it is allowed to infiltrate the ground, but so far, this has not been done. The WVDEP actually recommends that areas like this not be developed due to the risk to groundwater. Their guiding document, Stormwater

Management Design in Karst Areas states, "it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that the best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." This guidance should be followed; clearly we cannot expect the DEP to protect us from inappropriate zoning changes. Mr. Stranko indicated that the council should not take environmental issue into consideration when zoning. However, it is clear that the DEP is imploring local governments to take the hydrogeology and in particular karst into consideration when zoning.

The wellhead protection area for the Fox Glen's well and that of the elementary school where our children go to school intersects with the land where the zoning change is being proposed. However, a USGS study has shown that the groundwater aquifer here moves relatively fast and so contamination throughout this property is a concern for our water quality. This zoning change will clearly endanger the safety of our water supply. If the well at Fox Glen is contaminated and the utility is forced to divert water from further away, this may be used as evidence at the Public Service Commission to raise the water tariff on Fox Glen residents. This is an increase many will not be able to afford, raising the risk of water insecurity. Through this effect on the water supply the industry this zoning change will provide for will adversely affect the safety and welfare of our community.

The air emissions that will be produced by the industry that this zoning will allow include gaseous (SO₂, NO₂, O₃ (VOC and NO_x)), particulate matter (PM₁₀, PM_{2.5}, PM_{0.1}), and hazardous emissions (neurotoxins and carcinogens). We will be exposed through our lungs from the air we breathe, through our skin from the air and things we contact, and through contaminated things we may ingest. Our kids will be more exposed because they spend more time playing outside and on the ground and kids like to put things in their mouth. In fact, according to the National Academy of Science, our kids are more at risk because they breathe more air per pound than adults, their detoxification pathways are less mature, they are growing and developing and these processes are more sensitive, and they have more years to live yet and thus more years to develop slow onset diseases. Exposure to air pollution in early human development, especially exposure to fine particulate pollution, can be extremely deleterious to children's health and development.

The negative effects start in utero. Embryonic and fetal cells are exquisitely sensitive and are affected directly by inhaled pollutants that across the placenta like fine particulate matter as well as other secondary pathways causing impaired organ development, disturbed development of the immune system, premature birth, lower birth weight, and increased infant mortality. These early changes lead to long-term effects including increased disease development in multiple organ systems throughout life, cognitive defects, achievement deficits, and negative psychological social and economic effects.

Fetal and early life exposure to air pollution causes inappropriate brain growth and maturation in early life, neurodevelopmental disorders, early cognitive deficits, and has been associated

with autism by several case-control studies. Several studies have demonstrated a scholastic deficit in exposed children for almost all subject matter and at a variety of grade levels. The cause of these findings are multifactorial and researchers suggested they include exacerbation of asthma symptoms, other decreased health parameters, increased fatigue, increased absence, or a direct neurodegenerative effect, all caused by or contributed to by the exposure to air pollution.

Development of the respiratory system starts in utero, is 80% complete by age 6, and continues to early 20s. A review by Korten et. al. in 2017 explained that exposure to air pollution during the first 6 years of life can damage the lung tissue, impair lung growth, and alter the development of immune function and repair mechanisms within the lungs. These effects increase both short- and long-term risk for asthma, chronic obstructive pulmonary disease (COPD), lung cancer, and respiratory infections. Exposure to outdoor air pollution not only increased the risk of these diseases, but exacerbates existing disease increasing severity of symptoms, hospital visits, and death due to these diseases. A 2019 study found “even within the limits set by the World Health Organization, the pollutants PM10, SO2, NO2, and O3 are associated with increased risk of treatment for respiratory diseases in children 0 to 6 years of age.” It is important to note that the US limits are set higher than the WHO, 300% higher in the case of PM10!

There are a multitude of other physiologic effects of air pollution that cause increased rates of morbidity and mortality in both adults and children. Air pollutants are associated with increased risk of autoimmune diseases like asthma, allergies, and eczema. Air pollution has deleterious effects on the cardiovascular system, endocrine system and blood, contributing to the occurrence of high blood pressure, high cholesterol, obesity, anemia, and stroke.

There are psychological effects as well. A review, of 178 published articles by Lu published in 2020, systematically examined the psychological (affective, cognitive, behavioral), economic, and social effects of air pollution and found: “Affectively, air pollution decreases happiness and life satisfaction, and increases annoyance, anxiety, mental disorders, self-harm, and suicide. Cognitively, it impairs cognitive functioning and decision making. Behaviorally, air pollution triggers avoidance behavior, defensive expenditure, and migration as coping strategies. Economically, it hurts work productivity and stock markets. Socially, it exacerbates criminal activities and worsens perception of the government. Importantly, both actual and perceived air pollution levels matter.”

Through negative physical and mental health effects air pollution has been shown to decrease an individual’s productivity and ability to participate in the workforce, negatively impacting workforce availability and overall productivity. This negatively impacts individual workers, companies, and the local economy. It also decreases individual’s ability to relocate themselves or their family into an area less affected by pollution. In this way a vicious cycle is set up where successive generations are exposed to the same pollutants and experience the negative effects of the ongoing exposure to pollution. This is not a fate the children of Fox Glen deserve to have thrust upon them by this zoning change and the industry that it will allow into our bucolic

county. An editorial in the New England Journal of Medicine, commenting on several recent studies, stated: "The best control strategy from the standpoint of human health, supported by the scientific evidence to date, is to reduce the levels of all types of air pollutants. Our children's health depends on it." Clearly the industry that this zoning change will provide for will negatively effect the health, safety, and welfare of our community.

The area surrounding the location, of the proposed zoning change that will accommodate heavier types of industry, is historically lower income and underserved. Deciding to locate a tract of such zoning in this location when is it on the whole unwanted and totally inappropriate for the land and surroundings is an example of environmental injustice. The Lancet Commission on Pollution and Health, citing the United Nation's Universal Declaration of 1948 on Human Rights, found that "pollution threatens fundamental human rights - the right to life, the right to health, the right to well-being, and the rights of the child." This rezoning represents not only a bygone era of economic development but a bygone era of environmental injustice and human rights violation.

The Lancet Commission on Pollution and Health further found that prevention of non-communicable diseases will require pollution prevention and that this will require fundamental changes in societal patterns of production, consumption, and transportation. This will require a paradigm shift to a more sustainable economic model based on recognition of human rights. They also found this is a major unexploited opportunity in society that many communities are grappling with undertaking. The movement away from the smart code zoning, with it integrated walkable communities, to large tracts of land dedicated to polluting industry close to a title one school is the exact opposite of this. This rezoning would represent a major step in the wrong direction for disease prevention, human rights, Ranson, and Jefferson County!

This change in zoning is not appropriate for this land and this area. This land itself is not well suited for the industry this zoning change would allow. This industry would severely adversely affect the health, safety and welfare of our community. Please vote NO on the Ordinance #2017-302.

Sincerely,

Tabitha Breeden

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would put at risk the health and well being of children of Jefferson County.

The type of industry that ordinance #2017-302 would allow in Ranson would generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. Exposure to these pollutants has devastating effects on children's health. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. Developing fetuses whose mothers are exposed to air pollution are more likely to have impaired organ development which can lead to early cognitive deficits, neurodevelopmental defects and other physical, cognitive, and psychological deficits later in life. An association between autism and prenatal exposure to particulate matter in air pollution has been demonstrated in several studies. Many studies have shown that lower test scores in math, English, and language arts are associated with exposure to outdoor air pollution. Industrial activity allowed by ordinance #2017-302 would also increase the risk of groundwater contamination in Ranson and nearby municipalities. Children whose families rely on well water, as is the case in much of Jefferson County, may be affected by polluted water. Voting no on ordinance #2017-302 will prevent air and water pollution from negatively affecting the long-term health of children in Jefferson County and surrounding areas.

The economic and environmental harm caused by the type of industry that ordinance #2017-302 would allow would put additional stress on the parents, caretakers, and teachers of children in affected areas. The weakening and destabilizing of this support network would have negative effects on local children. Many households in Jefferson County depend on the local agriculture, tourism, and equine industries for income. If industrial activity in Ranson depresses these industries, the resulting financial strain on these households will introduce additional stress and uncertainty into children's lives. Households living in areas affected by particulate

matter and regional haze will also suffer from the psychological effects of air pollution. Individuals living in areas with increase perception of pollution show increased levels of stress, anxiety, and unhappiness. School districts affected by increased air and water pollution may have trouble recruiting and retaining teachers. Teachers have a large influence on a child's daily life and, if educator quality and tenure decreases, the quality of this influence will diminish.

The site of the proposed rezoning in Ranson is across the road from an elementary school and proximal to lower-income neighborhoods. Observations like these demonstrate how ordinance #2017-302 would disproportionately affect vulnerable and historically-disadvantaged populations. The damaging health effects of air pollution have been shown to persist for at least three generations, so allowing certain types of industry in low-income areas would only compound existing disadvantages. Voting no on ordinance #2017-302 would be a step towards acknowledging that all individuals have the right to clean air and water.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." This zoning change would clearly adversely affect the health, safety, and welfare of the community. Children face increased exposure to air pollution adversely affecting their health, financial instability adversely affecting their welfare, groundwater contamination adversely affecting their safety, and environmental injustice and discrimination if ordinance #2017-302 is passed. Educators will face increased air pollution adversely affecting their health and consequently welfare. These adverse effects are all against Ranson's Comprehensive Plan. Please vote NO on Ordinance #2017-302.

Sincerely,

Benjamin Bankhurst

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would negatively affect tourism, economic agility, groundwater quality, and individual health in neighboring municipalities like Shepherdstown. In doing these things the industry that this zoning change provides for will adversely affect the health, safety, and welfare of our community.

Tourism is critically important to Shepherdstown's economy and to the county as a whole. In 2018, tourist spending in the Jefferson County contributed over \$170 million to state and local government revenue and \$213 million in individual earnings. Importantly, most of this money comes from tourists visiting from neighboring states like Virginia, Maryland, and Washington D.C. Out-of-state tourists are largely drawn to Jefferson County because of its reputation for environmental-friendly, sustainable industry. Key elements that support this reputation include the county's pastoral scenery and pristine natural resources. Ordinance #2017-302 will allow industry into Jefferson County that risks harming these elements and dramatically reducing the area's appeal to visitors. The resulting harm to our tourist industry would drive away visitors and decrease state, county, and local revenue. The long-term success of Jefferson County's tourism industry is dependent on local governments making coordinated zoning decisions. Allowing certain types in industry in Ranson will negatively affect tourism in every municipality throughout the county, including Shepherdstown. Voting no on ordinance #2017-302 will protect the foundations of the county's tourism industry and protect the 7,040 jobs in Jefferson County that are directly supported by tourism. In this way the industry this zoning change will allow will adversely affect the welfare of our community.

The type of large, consolidated industry that ordinance #2017-302 would allow in Ranson would generally reduce the flexibility of local economies in Jefferson County. Historically, the driving industries in Jefferson County have been tourism, agriculture, and the equine industries. These three industries are large conglomerates of small businesses. Small business is very important

to Shepherdstown. Small businesses have been shown to create more jobs, cultivate more innovation, and provide more opportunities than big, non-local firms. Additionally, small businesses have been shown to be more reactive to sudden changes relative to manufacturing businesses. Bringing large, manufacturing-based industry into Jefferson county will depress the local economy and stifle innovation. During this time of economic upheaval and uncertainty, Jefferson County needs to support industries that will allow local economies to adapt and recover as fast as possible.

Voting no on ordinance #2017-302 will help protect water resources throughout Jefferson County. The type of industry that ordinance #2017-302 would allow puts the ground resources of Jefferson county at significant risk due to the karst hydrogeology. The site in Ranson is in the Rocky Marsh Run watershed, which is in the source water protection zone for Shepherdstown and drains to the Potomac River. Therefore, activity at this site will affect both groundwater and surface water streams. In municipalities like Shepherdstown, many residents and nearby farms depend on wells for water. Contamination of groundwater aquifers would create both health and remediation concerns for local residents. Dye tests performed by the USGS near the area of proposed rezoning in Ranson have shown just how far-reaching groundwater contamination at the Ranson site could be. Results from the USGS study revealed measurable dye concentrations in Elk's Run, Rattlesnake Run, and even the Shepherdstown Town Run. This last run cuts through the center of Shepherdstown and is a favorite area for children to play and learn to fish. In this way, the industry that this zoning change will allow will adversely affect the safety of our community.

Groundwater pollution is not the only concern for communities like Shepherdstown. The type of industry that ordinance #2017-302 would allow in Ranson would also generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. These pollutants are particularly harmful to children. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. The site in Ranson is across the road from an elementary school and also within the Jefferson High Middle district. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of children in Shepherdstown and all of Jefferson County. In this way, the industry that this zoning change will provide for will adversely affect the health of our community.

I again request that you vote no on ordinance #2017-302. This zoning change will allow industry that will adversely affect the health, safety, and welfare of our community. The long-term economic, environmental, and community health of municipalities like Shepherdstown depend on Ranson's participation in a coordinated zoning plan for all of Jefferson County.

ON A PERSONAL NOTE: our decision to move to Shepherdstown was precisely because of the the local environmental beauty of the Potomac River area from here all the way to Harper's Ferry. Even several years ago when we were looking in the WV area, we were concerned about ground water contamination given our reliance on water from a well system in our purchased home. Our priority is an environmentally responsive community, and for this issue of Rockwool to arise after our purchasing our home several years ago is very concerning to us. We

respectfully recommend that creating an environment hospitable to home owners who have relocated for the beauty is better for the long term health of the communities in the Shepherdstown area than is allowing heavy industry to profit by damaging what brought us here in the first place. Those who live here are invested in the health of the area more than industries that seek leniency in regulation.

Sincerely,

Kevin Jensen

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from the new community to SDI, Ranson has ensured that such an industry will come to fruition.

The industry that this rezoning will provide produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter, and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood, and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution, it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately

decreasing return on investment, cash flow, and overall earnings for owners, breeders, and trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see a decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it.

Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

It is a sad day when one community such as Ranson, ignoring the needs and present environmental state which encourages a lot of businesses to flourish in our area such as tourism, equestrian, and agriculture, especially the local vineyards which really require a delicate balance of air quality to flourish are destroyed by a selfish and shortsighted insistence on pursuing heavy industry permits.

The fact that this facility is very close to an elementary school and the fact that children are very susceptible to health problems from the air they breathe which portends to be greatly reduced in quality because of the pollution it will deliver is more than appalling to me.

Sincerely,

Susan W. Topping

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would put at risk the health and well being of children of Jefferson County.

The type of industry that ordinance #2017-302 would allow in Ranson would generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. Exposure to these pollutants has devastating effects on children's health. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. Developing fetuses whose mothers are exposed to air pollution are more likely to have impaired organ development which can lead to early cognitive deficits, neurodevelopmental defects and other physical, cognitive, and psychological deficits later in life. An association between autism and prenatal exposure to particulate matter in air pollution has been demonstrated in several studies. Many studies have shown that lower test scores in math, English, and language arts are associated with exposure to outdoor air pollution. Industrial activity allowed by ordinance #2017-302 would also increase the risk of groundwater contamination in Ranson and nearby municipalities. Children whose families rely on well water, as is the case in much of Jefferson County, may be affected by polluted water. Voting no on ordinance #2017-302 will prevent air and water pollution from negatively affecting the long-term health of children in Jefferson County and surrounding areas.

The economic and environmental harm caused by the type of industry that ordinance #2017-302 would allow would put additional stress on the parents, caretakers, and teachers of children in affected areas. The weakening and destabilizing of this support network would have negative effects on local children. Many households in Jefferson County depend on the local agriculture, tourism, and equine industries for income. If industrial activity in Ranson depresses these industries, the resulting financial strain on these households will introduce additional stress and uncertainty into children's lives. Households living in areas affected by particulate

matter and regional haze will also suffer from the psychological effects of air pollution. Individuals living in areas with increase perception of pollution show increased levels of stress, anxiety, and unhappiness. School districts affected by increased air and water pollution may have trouble recruiting and retaining teachers. Teachers have a large influence on a child's daily life and, if educator quality and tenure decreases, the quality of this influence will diminish.

The site of the proposed rezoning in Ranson is across the road from an elementary school and proximal to lower-income neighborhoods. Observations like these demonstrate how ordinance #2017-302 would disproportionately affect vulnerable and historically-disadvantaged populations. The damaging health effects of air pollution have been shown to persist for at least three generations, so allowing certain types of industry in low-income areas would only compound existing disadvantages. Voting no on ordinance #2017-302 would be a step towards acknowledging that all individuals have the right to clean air and water.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." This zoning change would clearly adversely affect the health, safety, and welfare of the community. Children face increased exposure to air pollution adversely affecting their health, financial instability adversely affecting their welfare, groundwater contamination adversely affecting their safety, and environmental injustice and discrimination if ordinance #2017-302 is passed. Educators will face increased air pollution adversely affecting their health and consequently welfare. These adverse effects are all against Ranson's Comprehensive Plan. Please vote NO on Ordinance #2017-302.

Sincerely,

assunta wight

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' or TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Richard Wight

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would negatively affect tourism, economic agility, groundwater quality, and individual health in neighboring municipalities like Shepherdstown. In doing these things the industry that this zoning change provides for will adversely affect the health, safety, and welfare of our community.

Tourism is critically important to Shepherdstown's economy and to the county as a whole. In 2018, tourist spending in the Jefferson County contributed over \$170 million to state and local government revenue and \$213 million in individual earnings. Importantly, most of this money comes from tourists visiting from neighboring states like Virginia, Maryland, and Washington D.C. Out-of-state tourists are largely drawn to Jefferson County because of its reputation for environmental-friendly, sustainable industry. Key elements that support this reputation include the county's pastoral scenery and pristine natural resources. Ordinance #2017-302 will allow industry into Jefferson County that risks harming these elements and dramatically reducing the area's appeal to visitors. The resulting harm to our tourist industry would drive away visitors and decrease state, county, and local revenue. The long-term success of Jefferson County's tourism industry is dependent on local governments making coordinated zoning decisions. Allowing certain types in industry in Ranson will negatively affect tourism in every municipality throughout the county, including Shepherdstown. Voting no on ordinance #2017-302 will protect the foundations of the county's tourism industry and protect the 7,040 jobs in Jefferson County that are directly supported by tourism. In this way, the industry this zoning change will allow will adversely affect the welfare of our community.

The type of large, consolidated industry that ordinance #2017-302 would allow in Ranson would generally reduce the flexibility of local economies in Jefferson County. Historically, the driving industries in Jefferson County have been tourism, agriculture, and the equine industries. These three industries are large conglomerates of small businesses. Small business is very important

to Shepherdstown. Small businesses have been shown to create more jobs, cultivate more innovation, and provide more opportunities than big, non-local firms. Additionally, small businesses have been shown to be more reactive to sudden changes relative to manufacturing businesses. Bringing large, manufacturing-based industry into Jefferson county will depress the local economy and stifle innovation. During this time of economic upheaval and uncertainty, Jefferson County needs to support industries that will allow local economies to adapt and recover as fast as possible.

Voting no on ordinance #2017-302 will help protect water resources throughout Jefferson County. The type of industry that ordinance #2017-302 would allow puts the ground resources of Jefferson county at significant risk due to the karst hydrogeology. The site in Ranson is in the Rocky Marsh Run watershed, which is in the source water protection zone for Shepherdstown and drains to the Potomac River. Therefore, activity at this site will affect both groundwater and surface water streams. In municipalities like Shepherdstown, many residents and nearby farms depend on wells for water. Contamination of groundwater aquifers would create both health and remediation concerns for local residents. Dye tests performed by the USGS near the area of proposed rezoning in Ranson have shown just how far-reaching groundwater contamination at the Ranson site could be. Results from the USGS study revealed measurable dye concentrations in Elk's Run, Rattlesnake Run, and even the Shepherdstown Town Run. This last run cuts through the center of Shepherdstown and is a favorite area for children to play and learn to fish. In this way, the industry that this zoning change will allow will adversely affect the safety of our community.

Groundwater pollution is not the only concern for communities like Shepherdstown. The type of industry that ordinance #2017-302 would allow in Ranson would also generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. These pollutants are particularly harmful to children. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. The site in Ranson is across the road from an elementary school and also within the Jefferson High Middle district. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of children in Shepherdstown and all of Jefferson County. In this way, the industry that this zoning change will provide for will adversely affect the health of our community.

I again request that you vote no on ordinance #2017-302. This zoning change will allow industry that will adversely affect the health, safety, and welfare of our community. The long-term economic, environmental, and community health of municipalities like Shepherdstown depend on Ranson's participation in a coordinated zoning plan for all of Jefferson County.

Sincerely,

Theresa Trainor
Shepherdstown, 25443

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on Ordinance #2017-302. Ranson's proposed zoning change presents a significant risk to the equine industry in Jefferson County and well beyond. The type of industry that would be allowed by the proposed zoning change in this location would jeopardize horse health, the ground water supply, and workforce productivity. This will cause immediate shrinkage and threaten the long-term viability of the equine industry in the county. In doing so, the industry this zoning change will allow for will adversely affect the health, safety, and welfare of our community.

The site of the proposed rezoning is less than six miles from Charles Town Races, with several breeding, training, and rehabilitation facilities between the two. The industry allowed by this rezoning would produce particulate, gaseous, and hazardous air emissions that would reach these sites. According to the WVDEP air permit, the Rockwool plant in Ranson is permitted to emit 250.87 tons of particulate matter per year into the air (1).

According to a recent study published in the journal of Veterinary Internal Medicine (2), horses are 15 times more sensitive to inhaled particulate matter than humans. Inhaled particulate matter can cause inflammation in horses' lungs that negatively affects performance. Inhaled particulate matter also contributes to the development of inflammatory airway disease (IAD) (3). IAD is a chronic airway disease that can affect horses long after their racing career is over. While there is little research on how other air pollutants affect horses, the effects of pollution on humans can be used to infer potential impact on horses. However unlike human models, these horses are elite athletes continuously exposed, and will thus likely experience detrimental effects at much lower levels of air pollution than humans.

The primary concern with air pollution is that increased levels of pollutants will increase inflammation in horses' lungs. Even small, subclinical amounts of inflammation in the lungs of horses negatively affect performance (2,3,4,5,6,11). This inflammation can also cause increased

recovery times following racing (7,11). Reduced performance and training interruptions can lead to higher risk of injury, reduced winning average, fewer yearly starts, lower yearly earnings, shortened career length, fewer lifetime starts, reduced lifetime earnings, and reduced quality of life (2,3,8,9,11). Each of these situations will lead to decreased return on investment, decreased cash flow, and decreased overall earnings for owners, trainers, and breeders with horses at Charles Town Races and in nearby areas. In this way, the industry this zoning will allow will adversely affect the welfare of our community.

While racing is usually a thoroughbred's first career, it is rarely their last. Some racing horses go on to be breeding stock, while others will have successful careers as sport horses. Jefferson County is an important source of new stock for sport horse trainers from Northern Virginia, and Maryland, and this is a resource for local horseman of both income and placement for horses not appropriate for breeding. However, if retired racehorses are unsound from injury or respiratory disease, they can be difficult to manage as breeding stock or unfit for a career as a sport horse. This affects the horse's quality of life and also places a burden on the industry locally and regionally. In this way, the industry this zoning will provide for will adversely affect the welfare of our community.

The perception of decreased air quality from the increase in regional haze and visible smokestacks as one drives into the county will deter out of state Owners and Breeders from investing in West Virginia bred Race horses, decreasing or eliminating a critical \$50 million a year source of local business volume. In this way, the industry this zoning will provide for will adversely affect the welfare of our community.

Another concern related to the proposed rezoning in Ranson is the risk of groundwater contamination as a result of the karst hydrogeology at the site and the industrial activity. Horsemen will either have to take on the expense of periodically testing water sources or they may not know local ground water is contaminated until their animals are sick. Veterinary care and testing adds expense and uncertainty to an industry that already deals with large inherent risks. The actual occurrence of ground water contamination would be devastating for Jefferson County's equine industry. For both geographic and financial reasons, it is simply impossible to think that the industry could solely use public or private utility-provided water if industrial activity fouled the local groundwater. In this way, the industry this zoning will provide for will adversely affect the health, safety, and welfare of our community.

Finally, studies on US agricultural workers have demonstrated that increased air pollution decreases productivity of outdoors workers. This would place an additional burden on workers, small business owners and the industry. In this way the industry this zoning will provide for will adversely affect the health, safety, and welfare of our community.

The equine industry in Jefferson County is hundreds of years old. It is not worth risking this historic and economically valuable industry by rezoning for industrial companies like Rockwool. An economic impact study of the Charles Town Thoroughbred Horse Racing Industry on Jefferson County's economy found that the spending by owners, breeders, and trainers of the

equine industry directly contributes \$79.4 million to the county each year. Out-of-state owners, breeders, and trainers spend more than \$50 million in Jefferson County every year. The value of total business volume in Jefferson County is \$191 million each year (10). These numbers do not include the effect of the handle or the casino.

The equine industry provides jobs for a broad cross-section of the public. This industry offers individuals of any educational background a variety of paths to achieve a good middle-income living. Many jobs allow individuals to pursue apprenticeships or on-the-job training rather than requiring a costly college education. This flexibility allows for greater lifetime earnings and improved educational debt-to-earnings ratio for these workers. The equine industry also provides opportunities for non-traditional workers by offering job opportunities to those who may not be employable by larger corporations. This industry provides a variety of fulltime, part-time, flexible, and pick-up work. Encouraging this type of flexible job ecosystem helps create a healthy economy with broad participation in employment and consumption.

The equine industry is a large conglomerate of small businesses, which have a multitude of economic benefits over having a few large businesses. It has been extensively reported that small locally owned businesses and start ups create more jobs, cultivate innovation, generate higher incomes, and provide more opportunities for individuals that would otherwise not exist than big non-local firms, which can actually depress local economies. The equine industry provides opportunities for small businesses and startups responsible for this growth of better jobs that are so good for the economy.

The equine industry offers so many other benefits that the industry in the rezoned area would not. For example, the equine industry supports local agriculture by providing a market for agricultural goods such as straw. The robust straw market supported by owners, trainers, and breeders allows for a third cash crop to be produced from one field in a year. Through pastureland and support of local agricultural goods, the equine industry protects and preserves the open spaces that give our county its bucolic quality and help attract tourists. Through the breeders' incentive programs, the equine industry offers unique opportunities to draft state funds back to Jefferson County, to name a few.

Rezoning this area of Ranson for Special District Industrial will allow in entities whose activities are harmful to the equine industry. The losses incurred by the equine industry would far outweigh any benefits derived from industries occupying the rezoned area. Sacrificing the long-term viability of one of our oldest and most productive industries for a net loss in business volume and economic value just does not make good sense for the local economy. This zoning change would provide for industry that would adversely affect the health, safety and welfare of our communities. Please vote NO on Ordinance #2017-302.

Sincerely,

Kelly Butterworth

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Lynn Delles

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask that you vote no on Ordinance #2017-302. While not in Ranson, the land and homes around the property that is the subject of the zoning change are closer to the property than anyone who currently lives within the city limits of Ranson. This area will be affected sooner and more harshly by the environmental issues that will develop secondary to the inappropriate siting of industry this zoning would allow.

The subject land has been well studied by Drs. Kozar, Doctor and Doctor and described in the scientific literature and USGS reports as having karst hydrology with very high aquifer vulnerability. The karst landscape is a consequence of the presence of soluble bedrock, which consists of limestone in the case of the subject land. In such landscapes water percolates through the ground and dissolves the underlying rock creating a porous network of caverns and throughways. Karst aquifers are known to be "extremely vulnerable to pollution" due to direct connection between the surface water and groundwater through both point (sinkholes) and diffuse (everywhere) infiltration. It is known from the Voluntary Remediation Plan of Jefferson Orchard that the groundwater at the subject site is only 60 feet below the ground. The subject property and much of the property around it are on an upland plain with few surface streams, but great seasonal variability in the water table resulting in numerous esteves and large amounts of water in the epikarst. This water is easily contaminated and this contamination spreads quickly throughout the aquifer. Dye tests performed near the subject site by the USGS have demonstrated this quick moving thorough dispersment in the aquifer in this area. While this contamination goes on to affect springs at the margins of the upland area continuing on in streams that service municipal water sources and the Potomac River, our concerns are far more immediate in both time and distance. Well water is the only water source available in the area of the proposed zoning change and, with the exception of Fox Glen, a majority of this water is supplied by private wells. Therefore, the groundwater aquifer fulfills a critical necessity, fulfilling all needs including human consumption, household uses, and agriculture and

maintenance of livestock and horses in the immediate area around the site. The concern is that if the aquifer becomes contaminated, then the local drinking water will be fouled.

For decades now, policy makers have been using “Aquifer Vulnerability,” to set land use and water resource protection policy. Karst has very high Aquifer Vulnerability. Therefore, this industrial use is not appropriate for this land and it should not be zoned for it. The guiding documents of the WVDEP recognize this. The introduction to the WVDEP document Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.”

The Chesapeake Bay Stormwater Network karst stormwater guidance document the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed, which the WVDEP cites in its own guiding document Stormwater Management Design in Karst Areas, clearly agrees stating:

“First, the effect of land development on karst terrain is complex and hard to predict, and requires professional analysis to reduce the risk of geological hazards, damage to infrastructure and groundwater contamination.” “The working group acknowledges that past approaches to stormwater and land development in karst terrain have been inadequate to safeguard the public and the environment.” “...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” We clearly need stronger comprehensive land use plans and zoning that direct new growth away from karst areas to more appropriate locations. Ordinance #2017-302 is literally the opposite of this.

Further, we cannot rely on the WVDEP to do the job that good local land use guidelines and zoning should do. For example, the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed states that detention and retention ponds are not recommended on karst and categorize them as discouraged. Also, quoting WVDEP’s own karst guidance: “attenuating surface runoff will increase the rate of sinkhole formation and potential groundwater contamination.” Yet the entity currently planning to utilize this zoning change is planning employment of multiple massive retention ponds and attenuating surface runoff completely. This has already been approved by the DEP in two Construction Stormwater General Permit registrations for that company. One of detention ponds is not even regulated by the DEP as it contains process water and has no outlet. Clearly the DEP recognizes the risks but is not appropriately limiting them. Relying on the DEP to protect the public health, safety, welfare, and the environment from any entity in these karst locations is simply as the CNS bulletin said it “inadequate to safeguard the public and the environment.” We must have appropriate zoning that takes into consideration appropriate use of land with karst hydrogeology. Ordinance #2017-302 does not do this, but instead increases the risk to the public and the environment.

A second serious concern is the air emissions from the industry that this zoning will provide for. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. These types of air emissions have been shown to increase the risk of, contribute to, and exacerbate a multitude of developmental, physical, physiological, physiological, cognitive and economic. The exposure of one individual can cause repercussions in multiple generations. Embryos, fetuses, and children are most vulnerable with effects born out over a lifetime, and that of their offspring. Many of these effects only require short-term exposure and some have even been shown to occur at levels below current limits recommended by the World Health Organization. One example of this is that a recent study found that “Even within the limits set by the World Health Organization, the pollutants PM₁₀, SO₂, NO₂, and O₃ are associated with increased risk of treatment for respiratory diseases in children 0 to 6 years of age.” Unfortunately, the US limits are higher than WHO, 300 % higher in the case of PM₁₀!

In fact, in 2019, in the Advice from the Independent Particulate Matter Review Panel (formerly U.S. EPA Clean Air Scientific Advisory Committee Particulate Matter Review Panel) on EPA’s Policy Assessment for the Review of the National Ambient Air Quality Standards for Particulate Matter, it stated that the committee unanimously and unequivocally found that the current primary annual and 24-hour PM_{2.5} National Ambient Air Quality Standards (NAAQS) are not adequate to protect public health. The advice from this 20-member committee, whose scientific disciplines include epidemiology, medicine, toxicology, air quality measurement, air quality modeling, exposure assessment measurement and modeling, risk assessment, statistics, and others, was ignored due presumably to political pressure. Not only are the NAAQS too high in some cases, but due to the measure and mechanism by which they work, they can not replace the safety provided by good land use and zoning regulations, that are meant to do things like keep factories with air emissions and hundreds of heavy trucks away from elementary schools. In fact, there is a state law that prohibits siting a school near a factory. Unfortunately, the reciprocal law does not exist. Clearly, just like with the water resources, we cannot rely on the DEP or the EPA to do the job of what appropriate zoning should do. The whole point of zoning is to keep people safe and provide for their health and welfare. Ordinance #2017-302 puts families and school children directly in harms way.

The air emissions, threat to the groundwater, and the very presence of the industry that this zoning change will allow for will have a serious negative economic effect on those who live and or work closest to the site in question. Productivity and workforce participation will be negatively affected by the health effects of the air emissions. The local agricultural operations will be negatively affected by the air emissions with lower quantity and quality of crop yield and would be devastated if the ground water aquifer were fouled. The equine operations in the area, of which there are several, will be negatively affected by the air emissions as they affect the horses’ health and performance. The mere presence of the industry that will be provided for by this zoning change will cause property values to fall. There will be serious economic consequences for the immediate area around the site in question.

Several of the communities in the immediate area of the site for proposed zoning change are traditionally underserved and have lower economic status. The choice of this location for such a zoning change represents an egregious example of environmental injustice that should not be promulgated or tolerated.

This zoning change will provide for industry that will negatively affect the health safety and welfare of our community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this, the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Lynn Delles

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask you to vote NO on Ordinance #2017-302. The industry this zoning change will allow for endangers the health, safety and, welfare of the community, and violates the premise of the smart code zoning that we have spent so much time, effort and federal money employing.

This zoning change will provide for industry that will negatively affect the agriculture industry in Jefferson County and beyond. The combination of the air emissions and threat to the ground water resources could have devastating consequences for the agricultural community of Jefferson County.

The comprehensive plan of Ranson is clear: it states, "the City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community." This land is ill-suited for an industrial facility due to its location and hydrogeology. Further, the industry that this zoning change will allow for will adversely affect the health, safety, and welfare of the community through its affect on the agricultural industry.

The agriculture industry in Jefferson County is hundreds of years old and continues to serve our community well today. According to the economic impact study "A Shared Agenda for Growing West Virginia's Agricultural Economy, Prepared by Fourth Economy for West Virginia Department Of Agriculture West Virginia University Extension Service 2012," Jefferson County is the second highest producing county for crops sales, third highest for fruits and vegetables sales, and in the top 9 counties for sales of animals and animal products.

Agriculture, tourism and the equine industries work synergistically to have an outsized positive impact on the economy in Ranson and Jefferson County as a whole. Agriculture drives tourism by creating agro-tourism opportunities, preserving beautiful open spaces that contribute to the

bucolic nature of our county, and providing the locally produced agriculture goods many tourists are look for in our markets and restaurants. Agriculture also supports the equine industry by providing local products like hay and straw, helping maintain pasture land, co-supporting local dual-purpose retail stores, and helping recycle by products. Agriculture helps maintain the way of life that many those who choose to live in Jefferson County enjoy. Industrial manufacturing and industry this zoning will provide for could never achieve these things.

Local agriculture also provides a source of locally produced agricultural goods. It has become apparent with the current pandemic and health emergency. This became a supply chain crisis because as our supply chains have moved to be ever more lean and efficient they lack resiliency and agility. By having a local source of agricultural goods and food we add resiliency and agility into our own economy and community. The agricultural industry in Jefferson County provides this.

A plethora of scientific studies have shown that a variety of air pollutants produced by the type of industry this zoning change would provide for causes decreased yields of both quantity and quality for several of the crops important to Jefferson County including winter wheat and soybeans. Soybeans and wheat are two of the crops significantly affected and two of the most prevalent crops in Jefferson County. Lower crop yields harm the farms and all the members of the down stream supply chain as well as the consumer. In this way, this zoning change will adversely affect the welfare of the community.

Recent studies have shown that even small increases in air pollution affect the productivity of agricultural workers. Similar to the reduction in crop yield this will negatively affect the individual workers, businesses, consumers and industry as a whole. In this way, this zoning change will adversely affect the health and welfare of individuals and the community.

Even more devastating is the possibility of groundwater contamination. The land at the subject location has karst hydrogeology and as such has porous bedrock and severe ground instability problems. The porous bedrock allows rapid diffuse infiltration of surface water into ground water and the severe ground instability problems leads to sinkhole development. Sinkholes provide direct connection of the surface water with the ground water aquifer through point infiltration. In fact, according to a 2012 study by Doctor and Doctor, the subject location and that of Terrapins Neck have the highest sinkhole vulnerability of any sites in Jefferson County. The propensity and easy of diffuse and point infiltration in areas of karst hydrogeology give them very high aquifer vulnerability meaning the aquifer is very vulnerable to contamination. For this reason, this measure has been used for decades by policymakers to set land use regulations. In this way, this zoning change and the industry it will provide for will adversely affect the welfare of the community.

The WVDEP recognizes development in car karst areas puts water resources high-risk for contamination but also recognizes that this is best protected against true local land use and zoning ordinances. WVDEP's guiding document Stormwater Management Design in Karst Areas

states, "it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." This document also references the Chesapeake Bay Stormwater Network karst stormwater guidance document the CSN Technical Bulletin no. 1, Stormwater design guidelines for karst terrain in the Chesapeake Bay watershed. In which it states "...there is always some inherent risk when development occurs on this sensitive terrain. Consequently, the best local approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." Land use policy in Ranson and zoning need to take aquifer vulnerability into consideration as these agencies and documents suggest.

The Jefferson Orchards Voluntary Remediation Plan application reports that the ground water is only 60 feet from the surface at the site. It is described in the scientific literature that this land is an upland plane with large amounts of water in the epikarst, and contamination of this water effects the whole aquifer including the communications with surface water streams. A USGS study demonstrated that the groundwater adjacent to the site communicates readily with several surface water structures and wells miles away from the site. The effects of contamination at this site would go well beyond Ranson fouling large portions of the ground water and surface water in Jefferson County.

Groundwater contamination at the site would have devastating effects on the Agricultural industry in Jefferson county. For geographic and economic reasons it is simply infeasible for the agricultural industry to rely on utility provided water. Based on the scientific literature the site being considered for rezoning is one of the areas of highest aquifer vulnerability in Jefferson County and is inappropriate for the industry that this zoning change will provide for. This land is clearly ill-suited for industrial use and should not be zoned for it.

By threatening the local agricultural industry, the industry that this zoning will provide for will threaten the health, safety, and welfare of the community, and this land is not well-suited for industrial use. The Comprehensive Plan in Ranson is clear the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Lynn Delles

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would put at risk the health and well being of children of Jefferson County.

The type of industry that ordinance #2017-302 would allow in Ranson would generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. Exposure to these pollutants has devastating effects on children's health. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. Developing fetuses whose mothers are exposed to air pollution are more likely to have impaired organ development which can lead to early cognitive deficits, neurodevelopmental defects and other physical, cognitive, and psychological deficits later in life. An association between autism and prenatal exposure to particulate matter in air pollution has been demonstrated in several studies. Many studies have shown that lower test scores in math, English, and language arts are associated with exposure to outdoor air pollution. Industrial activity allowed by ordinance #2017-302 would also increase the risk of groundwater contamination in Ranson and nearby municipalities. Children whose families rely on well water, as is the case in much of Jefferson County, may be affected by polluted water. Voting no on ordinance #2017-302 will prevent air and water pollution from negatively affecting the long-term health of children in Jefferson County and surrounding areas.

The economic and environmental harm caused by the type of industry that ordinance #2017-302 would allow would put additional stress on the parents, caretakers, and teachers of children in affected areas. The weakening and destabilizing of this support network would have negative effects on local children. Many households in Jefferson County depend on the local agriculture, tourism, and equine industries for income. If industrial activity in Ranson depresses these industries, the resulting financial strain on these households will introduce additional stress and uncertainty into children's lives. Households living in areas affected by particulate

matter and regional haze will also suffer from the psychological effects of air pollution. Individuals living in areas with increase perception of pollution show increased levels of stress, anxiety, and unhappiness. School districts affected by increased air and water pollution may have trouble recruiting and retaining teachers. Teachers have a large influence on a child's daily life and, if educator quality and tenure decreases, the quality of this influence will diminish.

The site of the proposed rezoning in Ranson is across the road from an elementary school and proximal to lower-income neighborhoods. Observations like these demonstrate how ordinance #2017-302 would disproportionately affect vulnerable and historically-disadvantaged populations. The damaging health effects of air pollution have been shown to persist for at least three generations, so allowing certain types of industry in low-income areas would only compound existing disadvantages. Voting no on ordinance #2017-302 would be a step towards acknowledging that all individuals have the right to clean air and water.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." This zoning change would clearly adversely affect the health, safety, and welfare of the community. Children face increased exposure to air pollution adversely affecting their health, financial instability adversely affecting their welfare, groundwater contamination adversely affecting their safety, and environmental injustice and discrimination if ordinance #2017-302 is passed. Educators will face increased air pollution adversely affecting their health and consequently welfare. These adverse effects are all against Ranson's Comprehensive Plan. Please vote NO on Ordinance #2017-302.

Sincerely,

Lynn Delles

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that will significantly harm the municipalities within Jefferson County and beyond effecting the health, welfare, and safety of our community. Harpers Ferry is a national treasure with the natural and historic resources tours flock to see each year and one of the communities that will be negatively impacted by this zoning change.

According to a 2019 study by the West Virginia Tourism Office, Jefferson County generated an average of \$178 million per year in tourism-derived revenue for state and local governments over the last 10 years, more than any other county in West Virginia by at least double. Tourism benefits the businesses and economy of Ranson and Jefferson County producing \$213.7 million in individual earning, 7040 jobs, and \$842.6 million in direct spending here in 2018. We would need 40 Project Shuttles to replace the individual earnings and 59 Rockwools to replace the jobs provided by the tourism industry in Jefferson County. It is important to note that most of the money generated by tourism in Jefferson County comes from neighboring states. In this way, it is like an export: not simply recycling money, but bringing money into the state increasing its wealth. Much of the economy in Harpers Ferry is based on this tourism industry. A threat to this industry poses a threat to the economy and welfare of our community.

One of the important drivers for tourism in Harpers Ferry is the Appalachian Trail. According to the Appalachian Trail Conservancy (ATC), Harpers Ferry is the psychologic midpoint of the Trail, and hikers often plan extended stays in Jefferson County with an obvious positive impact. The ATC reports that the smokestacks and associated lights will be visible in the viewshed of 15 vistas on the Appalachian Trail (AT). Studies have shown that quality of vistas and human impact on the environment are not only noticed by visitors, but effect their experience. Another study published in the Journal of Applied Recreation Research, found that points of interests and views drew visitors' attention and had a significant impact on their perception of the trail. It was also found that particularly beautiful vistas helped visitors overlook elements

that usually have a negative effect on trail experience like increased trail traffic. A 2009 study in Leisure Sciences revealed that scenic value was a perceptual theme of Appalachian Trail visitors, and that things as simple as dead trees visible in a vista can have a negative impact on visitors' overall perception. Imagine the effect the smokestacks will have from the 15 vistas from which they will be visible. The introduction of industrial activity made possible by the proposed rezoning in Ranson would have a negative effect on the scenic views of beautiful landscapes from the Appalachian Trail in Jefferson County.

The smokestacks are not all visitors will be able to see — the air pollution will create haze. The effect of regional haze on tourists was explored in a review article published in the Atmospheric Environment titled "Impaired visibility: the air pollution people see." A key takeaway on the negative affect of haze on vacationing tourists was summarized as follows:

"Vacations offer an escape from the routine and stress of our daily lives. Vacation destinations are often chosen based on their scenery; vacations are spent gazing at monuments, mountains, clouds, and oceans. Good visibility allows clear observation of distant features and appreciation of the inherent beauty of these scenes...Air pollution, which is often present in both our cities and parks, interferes with these attributes and can ruin the views vacationers travel to enjoy."

People seek bucolic, unspoiled areas to escape the stresses of urban areas. A 2004 study in Environment and Behavior found perceived pollution causes stress while viewing natural scenes has both psychological and physiological benefits, and a 2007 study confirmed these benefits. Two other studies found that people are emotionally affected by poor visibility, and tourists are disappointed when views are obscured by haze.

The combination of smokestacks and haze will mar the viewshed and will not only reduce the positive effects of a scenic landscape but also leave tourists disappointed and dissatisfied with their choice of destination. With these effects the welfare of the Harpers Ferry community would undoubtedly be endangered by the industry that this zoning change will provide for.

Multiple studies by doctors Kozar, Doctor, and Doctor have demonstrated that the land at this site to be rezoned is Karst with the highest likelihood of sinkhole development in the county, and that the groundwater aquifer there is incredibly sensitive to contamination from surface water. Further, this site is on an upland plain with relatively few surface streams, seasonal variability in the water table that results in numerous estavelles, and large amounts of water in the epikarst. In this area contamination in surface water communicates easily to the water in the epikarst via diffuse and point infiltration, and the springs at the margins of the upland area are directly affected by the water quality throughout the aquifer. According to Jefferson Orchards Voluntary Remediation Plan with the WVDEP, the groundwater at the site is approximately 60 feet below the ground, and the tests performed by the USGS have shown that groundwater from just adjacent to this site emerged in the headwaters of both the Elk's Run and Rattlesnake Run. This is critically important for Harpers Ferry because the Elk's Run headwaters is a spring about three miles southeast of the site and goes on to become the drinking water source for Harpers Ferry and Bolivar before emptying into the Potomac River.

The headwaters of Rattlesnake Run is a spring about 3.5 miles from the site and is also a tributary of the Potomac River. The Potomac River is the back up water source for Harpers Ferry. This means that the activity at the site will have a critical influence on the drinking water of Harpers Ferry. In this was the industry permitted by this change in zoning would undoubtedly endanger the health and safety of the community in Harpers Ferry.

The untoward health effects and individual economic consequences from the pollution emissions of the industry this rezoning will allow that will be born out over the length of people's lives and that of their decedents for at least three generations is an egregious example of environmental injustice that should not be tolerated. This zoning change may be in one of the poorest sections of the county, but the effects will be felt in every part of Ranson and the county.

The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." The industry that this rezoning will allow will jeopardize the health, safety and welfare of Ranson, Harpers Ferry and the whole county. Please vote no on the ordinance #2017-302.

Sincerely,

Lynn Delles

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would negatively affect tourism, economic agility, groundwater quality, and individual health in neighboring municipalities like Shepherdstown. In doing these things the industry that this zoning change provides for will adversely affect the health, safety, and welfare of our community.

Tourism is critically important to Shepherdstown's economy and to the county as a whole. In 2018, tourist spending in the Jefferson County contributed over \$170 million to state and local government revenue and \$213 million in individual earnings. Importantly, most of this money comes from tourists visiting from neighboring states like Virginia, Maryland, and Washington D.C. Out-of-state tourists are largely drawn to Jefferson County because of its reputation for environmental-friendly, sustainable industry. Key elements that support this reputation include the county's pastoral scenery and pristine natural resources. Ordinance #2017-302 will allow industry into Jefferson County that risks harming these elements and dramatically reducing the area's appeal to visitors. The resulting harm to our tourist industry would drive away visitors and decrease state, county, and local revenue. The long-term success of Jefferson County's tourism industry is dependent on local governments making coordinated zoning decisions. Allowing certain types in industry in Ranson will negatively affect tourism in every municipality throughout the county, including Shepherdstown. Voting no on ordinance #2017-302 will protect the foundations of the county's tourism industry and protect the 7,040 jobs in Jefferson County that are directly supported by tourism. In this way, the industry this zoning change will allow will adversely affect the welfare of our community.

The type of large, consolidated industry that ordinance #2017-302 would allow in Ranson would generally reduce the flexibility of local economies in Jefferson County. Historically, the driving industries in Jefferson County have been tourism, agriculture, and the equine industries. These three industries are large conglomerates of small businesses. Small business is very important

to Shepherdstown. Small businesses have been shown to create more jobs, cultivate more innovation, and provide more opportunities than big, non-local firms. Additionally, small businesses have been shown to be more reactive to sudden changes relative to manufacturing businesses. Bringing large, manufacturing-based industry into Jefferson county will depress the local economy and stifle innovation. During this time of economic upheaval and uncertainty, Jefferson County needs to support industries that will allow local economies to adapt and recover as fast as possible.

Voting no on ordinance #2017-302 will help protect water resources throughout Jefferson County. The type of industry that ordinance #2017-302 would allow puts the ground resources of Jefferson county at significant risk due to the karst hydrogeology. The site in Ranson is in the Rocky Marsh Run watershed, which is in the source water protection zone for Shepherdstown and drains to the Potomac River. Therefore, activity at this site will affect both groundwater and surface water streams. In municipalities like Shepherdstown, many residents and nearby farms depend on wells for water. Contamination of groundwater aquifers would create both health and remediation concerns for local residents. Dye tests performed by the USGS near the area of proposed rezoning in Ranson have shown just how far-reaching groundwater contamination at the Ranson site could be. Results from the USGS study revealed measurable dye concentrations in Elk's Run, Rattlesnake Run, and even the Shepherdstown Town Run. This last run cuts through the center of Shepherdstown and is a favorite area for children to play and learn to fish. In this way, the industry that this zoning change will allow will adversely affect the safety of our community.

Groundwater pollution is not the only concern for communities like Shepherdstown. The type of industry that ordinance #2017-302 would allow in Ranson would also generate air pollutants like fine particulate matter, ozone, and sulfur dioxide. These pollutants are particularly harmful to children. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease. The site in Ranson is across the road from an elementary school and also within the Jefferson High Middle district. Voting no on ordinance #2017-302 will prevent air pollution from negatively affecting the long-term health of children in Shepherdstown and all of Jefferson County. In this way, the industry that this zoning change will provide for will adversely affect the health of our community.

I again request that you vote no on ordinance #2017-302. This zoning change will allow industry that will adversely affect the health, safety, and welfare of our community. The long-term economic, environmental, and community health of municipalities like Shepherdstown depend on Ranson's participation in a coordinated zoning plan for all of Jefferson County.

Sincerely,

Lynn Delles

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully ask you to vote NO on Ordinance #2017-302. The industry this zoning change will allow for endangers the health, safety and, welfare of the community, and violates the premise of the smart code zoning that we have spent so much time, effort and federal money employing.

Any change in zoning needs to align with the comprehensive plan. In Ranson's current comprehensive plan (2012), the city only refers to "heavy industry" in the history section. Here it is characterized as part of a bygone era that has been replaced by an emphasis on agriculture for local food production, open spaces, and quality-of-life. In the remainder of the document, the word industry is used loosely to describe businesses including flower shops and shoe stores. Nothing that resembles the industry that this zoning change will provide for is described in the current comprehensive plan of Ranson.

In the land use section of the comprehensive plan, number ten states:

"Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The comprehensive plan clearly states that the city will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community. This change in zoning clearly negatively affects the health, safety, and welfare of the community.

As the zoning is proposed, the industry that this zoning change will allow for will be directly across the street from houses, parks and other small businesses. A densely populated subdivision and an elementary school already exit directly across the street. While these latter

community sections are not in the city limits, the effect of this zoning on them should still be considered just the same as it would be if they were in the city limits.

The industry that this zoning change will provide for will produce particulate, gaseous, and hazardous air emissions. These emissions have been shown to be detrimental to human health at every stage of life from embryo to old age. In utero and childhood exposure are the most damaging with lasting effects being realized through out life, and with maternal exposure the effects can be felt for generations. Multiple organ systems are affected including respiratory, cardiovascular, neurologic, immune, and endocrine causing defects in multiple processes including in utero development, neurodevelopment, immune and tolerance development, and cognitive defects. There are also psychological, social, and economic effects from both perceived and actual air pollution in both children and adults. Many of these effects can be seen even with short-term exposure or exposure that is lower than the levels recommended by the US Environmental Protection Agency and World Health Organization. These consequences are devastating to the individual and depressing to the local community and economy. State law does not allow a school to be built next to industry that this zoning will allow but yet we are contemplating changing the zoning so this industry can build next to a school. This does not make sense. As Ranson residents, we want Ranson to follow the lead of the state and keep polluting industry away from kids. In these ways, this change in zoning will negatively affect the health and welfare of the community.

In addition to the health effects of the air emissions is the threat to groundwater from the industry that this zoning change would allow. The land in question has karst hydrogeology and therefore very high aquifer vulnerability and is not appropriate for this industry. With the type of industry this zoning will provide for, combined with high aquifer vulnerability, the likelihood of groundwater contamination is too high for the community and region to bear. A USGS study demonstrated that contamination in the groundwater adjacent to the site moves relatively quickly and can be found in wells and surface water structures in a variety of locations in the County. In this way, contamination at the site would affect the drinking water of the great majority of Jefferson County residents. Through the surface water connections, the water at the site also affects the water resources of the region.

Aquifer vulnerability has been used by policy makers for decades to set land use regulations. The guiding document, from the WVDEP, Stormwater Management Design in Karst Areas states, "it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." In Ranson, we need to follow this advice and not change the zoning of this land for use by industry that has among the highest aquifer vulnerability in the County. This zoning change will endanger the safety of the community and region by endangering the safe water resources. As Ranson residents, we want to safeguard the water resources of the county and region by following the WVDEP guidance here.

Further, by reallocating this transect district and replacing it with a monolithic block of Special District Industrial designation, hundreds of housing units, parks and space for small businesses are lost. Ranson loses the potential for property tax on these properties and their improvements, Business and Occupational tax on the businesses and sales tax in retail stores. The community loses out on the opportunity to develop affordable housing and create locations where people can live, work, play, and shop all in the same place reducing the need for travel.

Worse yet apparently a deal has been made where the entity that owns the subject land has required that a litany of things not be built on the adjacent land essentially stripping the purpose of the smart code transect zone that exists there. Transect zones in the smart code are meant to transition, from out to in, and provide communities where people can safely work and live in close proximity in an effort to reduce travel. Excluding many of the components of the transect zone effectively eliminates the features that make it a transect zone, thus, losing the benefits a transect zone offers the community and city. By losing these benefits, reducing the overall and affordable housing prospects, and reducing so drastically the opportunities for city income, this zoning change will negatively affect the welfare of the community.

As Ranson residents, we find it odd that we are changing zoning to provide for industry that we would not put in the middle of our town close to our residents, but we are placing it close to the homes of county residents. Further, it is striking that the area where this change in zoning is directly adjacent to historically underserved lower income communities and a Title I school. This amounts to environmental injustice and cannot be tolerated.

The purpose of zoning is for a city to protect the health, welfare, morals and safety of the community. In this case, the air emissions and heavy truck traffic will endanger the communities' health. The threat of water contamination will endanger the safety of the community. The effect of lost productivity and decreased workforce participation due to increased illness and the negative effect the air emissions and presence of such a factory will have on the local economy will negatively affect the welfare of the community. The environmental injustice of changing the zoning to accommodate such polluting industry in a location where your municipality has no residents, but yet hundreds of low income and underserved county residents live is egregiously amoral. This must not happen. We respectfully implore you to do the right thing and vote no on ordinance #2017-302.

Sincerely,

Lynn Delles

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote NO on Ordinance #2017-302. This rezoning will put an undue hardship on the wastewater treatment systems, burden the rate payers and risk surface waterways in Charles Town, risking the health, safety and welfare of the community. The comprehensive plan of Ranson states, the City "will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community." Therefore, please vote NO on #2017-302.

The nature of the industry that this zoning will allow will be harmful to our local economy. Charles Town has spent a lot of time and money improving our downtown area for restaurants and retail. We are working to take advantage of the tourism industry in our county and bring more people into Charles Town. The eye sore, noise pollution, air pollution, and obvious move away from sustainability will drive people away from Jefferson County and Charles Town, rendering our efforts ineffective and unrewarding. This will make it harder for our small businesses to be successful. In this way, the industry this zoning will provide for will adversely affect the welfare of our community.

According to the 2018 WVU economic study of the eastern panhandle, over 40% of the workforce in Jefferson County choose to work outside of the state. These commuters bring that money home and spend it here supporting our local small businesses, economy and government. Charles Town has a large number of residents who commute. These typically higher earners may choose to leave the area because of the presence of the industry that this zoning change would provide for. This will cause a hardship on our economy and municipality. In this way, the industry this zoning will provide for will adversely affect the welfare of our community.

The industry that this zoning will allow will cause stress for multiple reasons on the Charles Town wastewater treatment systems and the surface waterways in Jefferson County and

beyond. The industry currently planning to utilize the zoning change will have discharge to the wastewater system that is high in chloride, primarily from its water softening system. The NPDES permit modification allows up to 5,000 mg/L. Chloride is not settled or removed at the wastewater treatment plant. It cannot be removed by conventional means and would be prohibitively expensive to do by new technology. This is of concern to Charles Town because chloride can harm stream water and also impair functioning of the wastewater treatment plant. Furthermore, the corrosive nature of chloride can cause damage to pipes both in the wastewater system and those used by downstream drinking water systems, like the \$207 million Trap Rock Water Treatment plant in Loudoun.

The human health criteria for chloride under WV standards is 250 mg/L. Under low stream flow conditions, chloride additions to the treatment plant effluent, as proposed by the industry currently planning to utilize the zoning change, could cause chloride levels in Evitts Run to exceed this standard. If the amount of chloride increased due to expansion or higher throughput, then this human health standard would be violated frequently. Chlorides are also known to harm aquatic life and effect metal toxicity in rivers. The USEPA and several states have surface water guidelines of 230mg/L for chronic exposure. This would also pose a risk of damaging the water treatment facilities downstream on the Potomac River.

A research study by Lefebvre and Moletta in 2006 showed that chloride and salinity impair the ability of wastewater treatment to remove phosphorus and nitrogen, and because of this, other states have introduced legislation to treat saline wastewater. Uygur and Kargi in 2004 looked at the effects of salt on synthetic wastewater treatment. They found that removal of both nitrogen and phosphorus was reduced when salinity increased from 0 to 6%. In fact, the removal efficiency of ammonia dropped from 96% to 39% with this increasing salinity. Hong et al. In 2016 found phosphorous removal decreased 20-28% when chloride concentrations went from 150 mg/L to 1,500 mg/L. Phosphorous removal was completely inhibited at concentrations greater than 2,500 mg/L. This increased salinity has the potential to make the Charles Town wastewater treatment system work far less efficiently.

In addition to the contents of the wastewater this type of industry will produce, the volume of sewage is itself a concern. Given that the City of Charles Town has been in violation of its permit on numerous occasions for spills and overflow of untreated sewage, adding large volumes of wastewater will further challenge the near capacity system. This will mean that costly capacity upgrades will need to be done likely sooner than they would have needed to be done, imposing further financial strain on the system. Through these effects, the industry this zoning will provide for will adversely effect the health, safety, and welfare of the community.

This zoning change will provide for industry the likes of which are not present in this county and have not been present in this county for many decades. We find it appalling that the introduction of zoning for such industry is being done in an area of the county that is historically underserved and lower income. It is even more egregious because the worst effects including air pollution and groundwater contamination will be felt first and most severely in the immediate vicinity, and Ranson does not even have residents in the immediate vicinity of the

proposed zoning change. This decision is being contemplated without representation of those who will be most affected. This would be a deplorable example of environmental injustice.

This zoning will provide for industry that will harm our economy, drive away residents, challenge and or damage our infrastructure, and may damage our waterways and wild life. Through these effects, the industry this zoning would allow will adversely effect the health, safety, and welfare of our community. This is being done with out representation of those it will affect the most. Please vote No on Ordinance #2017-302.

Sincerely,

Lynn Delles

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would have a negative effect on water and air quality in neighboring states such as Maryland.

The Potomac River provides drinking water and a source of recreation to Maryland residents. Water and air pollution generated within the Potomac River's watershed will inevitably contaminate this valuable waterway. The site of the proposed zoning change in Ranson is located within the Potomac River Watershed.

The type of industry that ordinance #2017-302 would allow in Ranson would utilize large water impoundments, in an area of known karst terrain. This water will be contaminant from several sources including particulate mater that has fallen out from the air emissions and process water. The West Virginia Department of Environmental Protection has published guidelines that specifically discourage extensive development in areas of karst terrain because of the vulnerability of karst aquifers to contamination by surface pollution. Karst features increase surface water and groundwater connectivity and any spills or surface releases quickly percolate into the groundwater. Additionally, sinkholes are common in karst terrain and can cause ruptures in wastewater impoundments. Even if appropriate attempts are made to contain and manage wastewater and other stormwater runoff on-site, there is still a high risk that wastewater could contaminate the groundwater through tears and catastrophic failure of wastewater impoundments. Contaminated groundwater in karst terrain can easily resurface in waterways several miles away, as shown by a USGS tracer study conducted near the site in to be rezoned. The USGS study detected tracer dye in multiple springs and waterways miles from the initial injection site in Ranson. All of these waterways drain into the Potomac River.

Mismanagement of wastewater could also lead to contamination of nearby surface waters. For example, the site of the proposed rezoning in Ranson is in the Rocky Marsh Run watershed.

Rocky Marsh Run also drains to the Potomac River. Voting no on ordinance #2017-302 will preserve downstream water quality and help ensure that the Potomac River remains usable for Maryland residents.

Air pollution poses another risk to Maryland residents. The type of industry that ordinance #2017-302 would allow would generate air pollutants like fine particulate matter. According to the US EPA, fine particulates can travel 100s of miles from its original source. Air pollution related to industrial activity in Ranson could easily reach Maryland. Fine particulates have a greater affinity for carrying toxic compounds and their small size allows them to be inhaled more deeply into the lungs. Chronic exposure to fine particulate matter is associated with increased risk of several diseases including Alzheimer's in adults. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease among others. Fine particulate matter also exacerbates regional haze which creates a visible reminder of air pollution. The psychological effects that arise from an increased perception of pollution include stress, anxiety, and unhappiness. Voting no on ordinance #2017-302 will help prevent increased air pollution from negatively affecting the long-term health of Maryland residents.

The industry that this zoning will provide for will threaten the health, safety, and welfare of the residents in Maryland, and this land is not well-suited for industrial use. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." To achieve this, the council must not approve this proposed zoning change.

I again request that you vote no on ordinance #2017-302. Zoning decisions in Ranson and Jefferson County have an undeniable influence on the quality of life in neighboring states.

Sincerely,

Lynn Delles

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

This land and this location are not appropriate for the industry this zoning change will allow. The hydrogeology of the land combined with such industrial activity risks the safety of our water supply. The air emissions from this industry will negatively impact our physical and mental health, our children's ability to achieve, our ability to make a living, our happiness, and it will do this for generations even after we leave or the pollution stops. The industry this zoning change will provide for will adversely affect the health, safety, and welfare of our community. It is not lost on us that this zoning change is being made next to our neighborhood and not next to the residents of Ranson, yet Ranson is in control. This is not right. We respectfully ask you to vote NO on ordinance #2017-302.

The land at the site in question is not just ill-suited, but completely inappropriate for the industry this zoning change will allow. This land has karst hydrogeology. As such, the ground itself is very unstable and readily develops sinkholes. This land has been described by a 2012 study to be exceptionally susceptible to sinkhole formation, more so than most of the rest of the county. Sinkholes provide point infiltration of surface water into the water in the epikarst. The porous bedrock allows diffuse infiltration of surface water into the epikarst water. At this site, there is also large amounts of water in the epikarst and it is only 60 feet from the surface. This allows the water at the surface to easily communicate with the water in the epikarst and the groundwater aquifer carrying any surface water contaminants with it.

The industrial activity this zoning change will allow for will cause ample surface water contamination from ground level industrial activities, raw material and waste storage and particulate matter falling to the ground from the air emissions. The industry that is currently planning to utilize this zoning change should be designated a stormwater hotspot just for this reason. The WVDEP should require them to treat all water before it is allowed to infiltrate the ground, but so far, this has not been done. The WVDEP actually recommends that areas like this not be developed due to the risk to groundwater. Their guiding document, Stormwater

Management Design in Karst Areas states, "it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that the best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations." This guidance should be followed; clearly we cannot expect the DEP to protect us from inappropriate zoning changes. Mr. Stranko indicated that the council should not take environmental issue into consideration when zoning. However, it is clear that the DEP is imploring local governments to take the hydrogeology and in particular karst into consideration when zoning.

The wellhead protection area for the Fox Glen's well and that of the elementary school where our children go to school intersects with the land where the zoning change is being proposed. However, a USGS study has shown that the groundwater aquifer here moves relatively fast and so contamination throughout this property is a concern for our water quality. This zoning change will clearly endanger the safety of our water supply. If the well at Fox Glen is contaminated and the utility is forced to divert water from further away, this may be used as evidence at the Public Service Commission to raise the water tariff on Fox Glen residents. This is an increase many will not be able to afford, raising the risk of water insecurity. Through this effect on the water supply the industry this zoning change will provide for will adversely affect the safety and welfare of our community.

The air emissions that will be produced by the industry that this zoning will allow include gaseous (SO₂, NO₂, O₃ (VOC and NO_x)), particulate matter (PM₁₀, PM_{2.5}, PM_{0.1}), and hazardous emissions (neurotoxins and carcinogens). We will be exposed through our lungs from the air we breathe, through our skin from the air and things we contact, and through contaminated things we may ingest. Our kids will be more exposed because they spend more time playing outside and on the ground and kids like to put things in their mouth. In fact, according to the National Academy of Science, our kids are more at risk because they breathe more air per pound than adults, their detoxification pathways are less mature, they are growing and developing and these processes are more sensitive, and they have more years to live yet and thus more years to develop slow onset diseases. Exposure to air pollution in early human development, especially exposure to fine particulate pollution, can be extremely deleterious to children's health and development.

The negative effects start in utero. Embryonic and fetal cells are exquisitely sensitive and are affected directly by inhaled pollutants that across the placenta like fine particulate matter as well as other secondary pathways causing impaired organ development, disturbed development of the immune system, premature birth, lower birth weight, and increased infant mortality. These early changes lead to long-term effects including increased disease development in multiple organ systems throughout life, cognitive defects, achievement deficits, and negative psychological social and economic effects.

Fetal and early life exposure to air pollution causes inappropriate brain growth and maturation in early life, neurodevelopmental disorders, early cognitive deficits, and has been associated

with autism by several case-control studies. Several studies have demonstrated a scholastic deficit in exposed children for almost all subject matter and at a variety of grade levels. The cause of these findings are multifactorial and researchers suggested they include exacerbation of asthma symptoms, other decreased health parameters, increased fatigue, increased absence, or a direct neurodegenerative effect, all caused by or contributed to by the exposure to air pollution.

Development of the respiratory system starts in utero, is 80% complete by age 6, and continues to early 20s. A review by Korten et. al. in 2017 explained that exposure to air pollution during the first 6 years of life can damage the lung tissue, impair lung growth, and alter the development of immune function and repair mechanisms within the lungs. These effects increase both short- and long-term risk for asthma, chronic obstructive pulmonary disease (COPD), lung cancer, and respiratory infections. Exposure to outdoor air pollution not only increased the risk of these diseases, but exacerbates existing disease increasing severity of symptoms, hospital visits, and death due to these diseases. A 2019 study found “even within the limits set by the World Health Organization, the pollutants PM10, SO2, NO2, and O3 are associated with increased risk of treatment for respiratory diseases in children 0 to 6 years of age.” It is important to note that the US limits are set higher than the WHO, 300% higher in the case of PM10!

There are a multitude of other physiologic effects of air pollution that cause increased rates of morbidity and mortality in both adults and children. Air pollutants are associated with increased risk of autoimmune diseases like asthma, allergies, and eczema. Air pollution has deleterious effects on the cardiovascular system, endocrine system and blood, contributing to the occurrence of high blood pressure, high cholesterol, obesity, anemia, and stroke.

There are psychological effects as well. A review, of 178 published articles by Lu published in 2020, systematically examined the psychological (affective, cognitive, behavioral), economic, and social effects of air pollution and found: “Affectively, air pollution decreases happiness and life satisfaction, and increases annoyance, anxiety, mental disorders, self-harm, and suicide. Cognitively, it impairs cognitive functioning and decision making. Behaviorally, air pollution triggers avoidance behavior, defensive expenditure, and migration as coping strategies. Economically, it hurts work productivity and stock markets. Socially, it exacerbates criminal activities and worsens perception of the government. Importantly, both actual and perceived air pollution levels matter.”

Through negative physical and mental health effects air pollution has been shown to decrease an individual’s productivity and ability to participate in the workforce, negatively impacting workforce availability and overall productivity. This negatively impacts individual workers, companies, and the local economy. It also decreases individual’s ability to relocate themselves or their family into an area less affected by pollution. In this way a vicious cycle is set up where successive generations are exposed to the same pollutants and experience the negative effects of the ongoing exposure to pollution. This is not a fate the children of Fox Glen deserve to have thrust upon them by this zoning change and the industry that it will allow into our bucolic

county. An editorial in the New England Journal of Medicine, commenting on several recent studies, stated: "The best control strategy from the standpoint of human health, supported by the scientific evidence to date, is to reduce the levels of all types of air pollutants. Our children's health depends on it." Clearly the industry that this zoning change will provide for will negatively effect the health, safety, and welfare of our community.

The area surrounding the location, of the proposed zoning change that will accommodate heavier types of industry, is historically lower income and underserved. Deciding to locate a tract of such zoning in this location when is it on the whole unwanted and totally inappropriate for the land and surroundings is an example of environmental injustice. The Lancet Commission on Pollution and Health, citing the United Nation's Universal Declaration of 1948 on Human Rights, found that "pollution threatens fundamental human rights - the right to life, the right to health, the right to well-being, and the rights of the child." This rezoning represents not only a bygone era of economic development but a bygone era of environmental injustice and human rights violation.

The Lancet Commission on Pollution and Health further found that prevention of non-communicable diseases will require pollution prevention and that this will require fundamental changes in societal patterns of production, consumption, and transportation. This will require a paradigm shift to a more sustainable economic model based on recognition of human rights. They also found this is a major unexploited opportunity in society that many communities are grappling with undertaking. The movement away from the smart code zoning, with it integrated walkable communities, to large tracts of land dedicated to polluting industry close to a title one school is the exact opposite of this. This rezoning would represent a major step in the wrong direction for disease prevention, human rights, Ranson, and Jefferson County!

This change in zoning is not appropriate for this land and this area. This land itself is not well suited for the industry this zoning change would allow. This industry would severely adversely affect the health, safety and welfare of our community. Please vote NO on the Ordinance #2017-302.

Sincerely,

Lynn Delles

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on #2017-302. The air emissions, possibility of ground and surface water contamination, and their effect on our interwoven economies threaten the health, safety and welfare of not just Jefferson County but the greater region, including Loudoun and the greater Northern Virginia area.

This zoning would provide for industry that produces large amounts of air emissions. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. Northern Virginia is directly downwind from these emissions. Much of the gaseous, fine particulate, and hazardous emissions can reach Northern Virginia. Further affecting the outdoor air quality of the adjacent portion of Virginia and the ability of these areas to achieve and maintain National Ambient Air Quality Standards (NAAQS) attainment. This will affect agriculture and outdoor leisure and recreation.

For example, Loudoun County has been in nonattainment for the NAAQS 8-hour Ozone standard for the past two years. VOC and NO_x react after they have been emitted to produce ground level ozone. The industry that this rezoning would provide for would produce large amounts of these emissions. This would make it even harder as Loudoun County tries to achieve attainment. As time goes on and the scientific research advances our knowledge and understanding of the extent to which gaseous, particulate and hazardous emissions affect human health the NAAQS standards are likely to be reduced. The effects on air emission from this rezoning will make it only harder for Loudoun and Northern Virginia to meet these standards.

In addition to the concerns about the air, the possible ground and surface water contamination is very concerning to Loudoun and Virginia residents. The site is known to have ground water that is vulnerable to contamination due to the karst hydrogeology. A USGS study demonstrated that the ground water adjacent to the site to be rezoned communicates readily with surface

water tributaries of the Potomac River. In addition to direct infiltration where water moves directly from the surface to groundwater via porous limestone bedrock, karst is known to have severe ground instability problems. This makes karst geology prone to sinkhole development. Sinkholes provide direct connection between the surface water and any contaminants it may contain and the groundwater. This makes the aquifer vulnerability in karst areas very high, and contamination with industrial activity such as that provided for by this rezoning too likely. In this way, this zoning change will adversely affect the health and welfare of individuals and the community.

Loudoun sources its drinking water from the Potomac River, downstream of many West Virginia tributaries that carry water from the epikarst and groundwater aquifer at the site to be rezoned. Loudoun has recently completed the new Trap Rock Water Treatment facility, which draws water from the Potomac River. Loudoun currently provides 40 million gallons and projects to provide 90 million gallons of drinking water a day to customers by 2040 (Loudounwater.org). Therefore, the viability of the Potomac River is a high priority for Virginia residents.

Loudoun and Northern Virginia is one of the fastest growing communities in the country and provides a lot to Jefferson County in their symbiotic relationship. Virginia residents support and enjoy Jefferson County through tourism, as our residents enjoy the natural and historical resources of your county. Virginia residents and businesses support the equine industry in a multitude of ways from providing wagering fans at the races to the Virginia Breeders Association Virginia Certified incentive programs and a strong market for retired racehorses. According to an economic impact study from WVU, at least 40% of Jefferson County residents travel outside of West Virginia for work, a good percentage of those travel to northern Virginia. This rezoning would allow for industry that would negatively affect the economy of both places and this relationship and the benefits for our residents gleaned from it.

This zoning change will provide for industry that will negatively effect the health safety and welfare of the Loudon and Northern Virginia community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Lynn Delles

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

Please vote no on ordinance #2017-302. This Ordinance would allow industry in Ranson that is not aligned with the comprehensive plan of the City. The Comprehensive Plan of Ranson under General Land Use Objectives states the following:

"10. Encourage manufacturing and assembly-line facilities to locate in Ranson. The City will designate ample land that is well-suited for industrial facilities and will ensure that industrial facilities do not adversely affect the health, safety, or welfare of the community."

The City has failed to address the latter part of this objective. By changing the Special District Industrial (SDI) in the way that the City did in 2017, this designation enables industry that will endanger the health, safety, or welfare of the community. By now changing this additional land from new community to SDI, Ranson has ensured that such industry will come to fruition.

The industry that this rezoning will provide for produces significant amounts of pollution. The air pollution would include gaseous emissions, particulate matter and hazardous air pollutants. These substances are known to cause diseases affecting multiple organ systems including the neurologic, immunologic, respiratory, cardiovascular, endocrine, blood and skin. These effects are strongest during gestation and childhood as development is exquisitely sensitive during these times, but the effects are realized throughout life negatively impacting a variety of lifetime parameters including physical and mental health and economics. Many of these effects have recently been shown to occur even below the World Health Organization standards. This rezoning will undeniably endanger the health of the community.

Through a combination of its visibility in the county and the pollution it produces this industry will harm the industries that are the pillars of our economy. The air pollution endangers the health and performance of the horses in the thoroughbred racing industry ultimately decreasing return on investment, cash flow, and over all earnings for owners, breeders, and

trainers. This group provides over \$70 million in direct business volume per year in Jefferson County. The agriculture industry will experience decreased crop yield due to the air pollution and will also see decreasing return on investment, cash flow, and overall earnings. The industry new would be an eyesore visible from many locations in the county, the haze will affect visibility and view, and both will have a negative effect on perceived sustainability to tourists. These effects will cause decreased visitors and again decrease return on investment, cash flow, and overall earnings for the hundreds of small businesses that make up the tourism industry. In these ways, the presence of the industry this zoning change will allow will have a substantial negative effect on the economy of Ranson and the County, and will undeniably endanger the welfare of the community.

The hydrogeology at the location is completely inappropriate for the type of industry this rezoning will allow. Due to the mature karst hydrogeology at the location, there is a high level of aquifer vulnerability. Pollution that has fallen to or is present on the ground, will be carried by surface water into the groundwater aquifer via diffuse and point infiltration. Even the engineering company hired by Thrasher engineering for Rockwool warned that it was impossible to eliminate the risk of sinkhole development and groundwater contamination. This is precisely why the guiding documents of the DEP recommend strong zoning and land-use regulations from local government to prevent development of karst areas. Because of the characteristics of the karst aquifer in this location, contamination of the groundwater here would affect the drinking water of the great majority of Jefferson County. This rezoning will undeniably endanger the safety of the community.

The Comprehensive Plan as quoted above states, “the City will designate ample land that is well-suited for industrial facilities.” Due to the hydrogeology, this land is not well-suited for industrial facilities as would be allowed by the Special District Industrial. Respectfully, Mr. Stranko is incorrect in his assertion that the council is not allowed to take the environment into consideration in zoning decisions, as it is the purview of the DEP. In fact, the DEP implores local governments to do just that in its guiding documents on stormwater design in karst. The DEP Stormwater Management Design in Karst Areas states, “it is important to note that the potential for geological hazards, damage to infrastructure, and groundwater contamination is an ongoing concern when developing in these areas. And that best approach is to craft stronger comprehensive land use plans that direct new growth away from karst areas to more appropriate locations.” Clearly, the DEP is encouraging local governments to use zoning to steer development like this away from karst land. This karst area is inappropriate and ill-suited for this use and it should not be zoned for it.

The Comprehensive Plan is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” This zoning change would clearly adversely affect the health, safety, and welfare of the community. The Comprehensive Plan further states, “the City will designate ample land that is well-suited for industrial facilities.” This land is clearly ill-suited for industrial use and should not be zoned for it. Therefore, the council should vote no on the zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

Roxanne Burkhardt

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would have a negative effect on water and air quality in neighboring states such as Maryland.

The Potomac River provides drinking water and a source of recreation to Maryland residents. Water and air pollution generated within the Potomac River's watershed will inevitably contaminate this valuable waterway. The site of the proposed zoning change in Ranson is located within the Potomac River Watershed.

The type of industry that ordinance #2017-302 would allow in Ranson would utilize large water impoundments, in an area of known karst terrain. This water will be contaminant from several sources including particulate mater that has fallen out from the air emissions and process water. The West Virginia Department of Environmental Protection has published guidelines that specifically discourage extensive development in areas of karst terrain because of the vulnerability of karst aquifers to contamination by surface pollution. Karst features increase surface water and groundwater connectivity and any spills or surface releases quickly percolate into the groundwater. Additionally, sinkholes are common in karst terrain and can cause ruptures in wastewater impoundments. Even if appropriate attempts are made to contain and manage wastewater and other stormwater runoff on-site, there is still a high risk that wastewater could contaminate the groundwater through tears and catastrophic failure of wastewater impoundments. Contaminated groundwater in karst terrain can easily resurface in waterways several miles away, as shown by a USGS tracer study conducted near the site in to be rezoned. The USGS study detected tracer dye in multiple springs and waterways miles from the initial injection site in Ranson. All of these waterways drain into the Potomac River.

Mismanagement of wastewater could also lead to contamination of nearby surface waters. For example, the site of the proposed rezoning in Ranson is in the Rocky Marsh Run watershed.

Rocky Marsh Run also drains to the Potomac River. Voting no on ordinance #2017-302 will preserve downstream water quality and help ensure that the Potomac River remains usable for Maryland residents.

Air pollution poses another risk to Maryland residents. The type of industry that ordinance #2017-302 would allow would generate air pollutants like fine particulate matter. According to the US EPA, fine particulates can travel 100s of miles from its original source. Air pollution related to industrial activity in Ranson could easily reach Maryland. Fine particulates have a greater affinity for carrying toxic compounds and their small size allows them to be inhaled more deeply into the lungs. Chronic exposure to fine particulate matter is associated with increased risk of several diseases including Alzheimer's in adults. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease among others. Fine particulate matter also exacerbates regional haze which creates a visible reminder of air pollution. The psychological effects that arise from an increased perception of pollution include stress, anxiety, and unhappiness. Voting no on ordinance #2017-302 will help prevent increased air pollution from negatively affecting the long-term health of Maryland residents.

The industry that this zoning will provide for will threaten the health, safety, and welfare of the residents in Maryland, and this land is not well-suited for industrial use. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." To achieve this, the council must not approve this proposed zoning change.

I again request that you vote no on ordinance #2017-302. Zoning decisions in Ranson and Jefferson County have an undeniable influence on the quality of life in neighboring states.

Sincerely,

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on ordinance #2017-302. The type of industry that this ordinance would allow in Ranson would have a negative effect on water and air quality in neighboring states such as Maryland.

The Potomac River provides drinking water and a source of recreation to Maryland residents. Water and air pollution generated within the Potomac River's watershed will inevitably contaminate this valuable waterway. The site of the proposed zoning change in Ranson is located within the Potomac River Watershed.

The type of industry that ordinance #2017-302 would allow in Ranson would utilize large water impoundments, in an area of known karst terrain. This water will be contaminant from several sources including particulate mater that has fallen out from the air emissions and process water. The West Virginia Department of Environmental Protection has published guidelines that specifically discourage extensive development in areas of karst terrain because of the vulnerability of karst aquifers to contamination by surface pollution. Karst features increase surface water and groundwater connectivity and any spills or surface releases quickly percolate into the groundwater. Additionally, sinkholes are common in karst terrain and can cause ruptures in wastewater impoundments. Even if appropriate attempts are made to contain and manage wastewater and other stormwater runoff on-site, there is still a high risk that wastewater could contaminate the groundwater through tears and catastrophic failure of wastewater impoundments. Contaminated groundwater in karst terrain can easily resurface in waterways several miles away, as shown by a USGS tracer study conducted near the site in to be rezoned. The USGS study detected tracer dye in multiple springs and waterways miles from the initial injection site in Ranson. All of these waterways drain into the Potomac River.

Mismanagement of wastewater could also lead to contamination of nearby surface waters. For example, the site of the proposed rezoning in Ranson is in the Rocky Marsh Run watershed.

Rocky Marsh Run also drains to the Potomac River. Voting no on ordinance #2017-302 will preserve downstream water quality and help ensure that the Potomac River remains usable for Maryland residents.

Air pollution poses another risk to Maryland residents. The type of industry that ordinance #2017-302 would allow would generate air pollutants like fine particulate matter. According to the US EPA, fine particulates can travel 100s of miles from its original source. Air pollution related to industrial activity in Ranson could easily reach Maryland. Fine particulates have a greater affinity for carrying toxic compounds and their small size allows them to be inhaled more deeply into the lungs. Chronic exposure to fine particulate matter is associated with increased risk of several diseases including Alzheimer's in adults. Children exposed to air pollution have an increased risk of developing asthma, cancer, diabetes, mental health issues, and cardiovascular disease among others. Fine particulate matter also exacerbates regional haze which creates a visible reminder of air pollution. The psychological effects that arise from an increased perception of pollution include stress, anxiety, and unhappiness. Voting no on ordinance #2017-302 will help prevent increased air pollution from negatively affecting the long-term health of Maryland residents.

The industry that this zoning will provide for will threaten the health, safety, and welfare of the residents in Maryland, and this land is not well-suited for industrial use. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will "not adversely affect the health, safety, or welfare of the community." To achieve this, the council must not approve this proposed zoning change.

I again request that you vote no on ordinance #2017-302. Zoning decisions in Ranson and Jefferson County have an undeniable influence on the quality of life in neighboring states.

Sincerely,

Bernadette Roche

Subject: Written Public Comment for hearing on #2017-302

Dear Ms. Pfaltzgraff:

Re: #2017-302: "AN ORDINANCE AMENDING AND RE-ENACTING THE OFFICIAL ZONING MAP OF THE CITY OF RANSON PURSUANT TO RANSON MUNICIPAL CODE § 19-20 AND CHAPTER 19A, ARTICLE 1: 'JEFFERSON ORCHARDS' REALLOCATING TRANSECT DISTRICTS (DISTRICT 8, TAX MAP 12, PARCEL 1)"

I respectfully request that you vote no on #2017-302. The air emissions, possibility of ground and surface water contamination, and their effect on our interwoven economies threaten the health, safety and welfare of not just Jefferson County but the greater region, including Loudoun and the greater Northern Virginia area.

This zoning would provide for industry that produces large amounts of air emissions. These emissions include gaseous NO₂, O₃ (VOC and NO_x), and (SO₂), particulate (PM₁₀, PM_{2.5}, PM_{0.1}), and other hazardous emissions. Northern Virginia is directly downwind from these emissions. Much of the gaseous, fine particulate, and hazardous emissions can reach Northern Virginia. Further affecting the outdoor air quality of the adjacent portion of Virginia and the ability of these areas to achieve and maintain National Ambient Air Quality Standards (NAAQS) attainment. This will affect agriculture and outdoor leisure and recreation.

For example, Loudoun County has been in nonattainment for the NAAQS 8-hour Ozone standard for the past two years. VOC and NO_x react after they have been emitted to produce ground level ozone. The industry that this rezoning would provide for would produce large amounts of these emissions. This would make it even harder as Loudoun County tries to achieve attainment. As time goes on and the scientific research advances our knowledge and understanding of the extent to which gaseous, particulate and hazardous emissions affect human health the NAAQS standards are likely to be reduced. The effects on air emission from this rezoning will make it only harder for Loudoun and Northern Virginia to meet these standards.

In addition to the concerns about the air, the possible ground and surface water contamination is very concerning to Loudoun and Virginia residents. The site is known to have ground water that is vulnerable to contamination due to the karst hydrogeology. A USGS study demonstrated that the ground water adjacent to the site to be rezoned communicates readily with surface

water tributaries of the Potomac River. In addition to direct infiltration where water moves directly from the surface to groundwater via porous limestone bedrock, karst is known to have severe ground instability problems. This makes karst geology prone to sinkhole development. Sinkholes provide direct connection between the surface water and any contaminants it may contain and the groundwater. This makes the aquifer vulnerability in karst areas very high, and contamination with industrial activity such as that provided for by this rezoning too likely. In this way, this zoning change will adversely affect the health and welfare of individuals and the community.

Loudoun sources its drinking water from the Potomac River, downstream of many West Virginia tributaries that carry water from the epikarst and groundwater aquifer at the site to be rezoned. Loudoun has recently completed the new Trap Rock Water Treatment facility, which draws water from the Potomac River. Loudoun currently provides 40 million gallons and projects to provide 90 million gallons of drinking water a day to customers by 2040 (Loudounwater.org). Therefore, the viability of the Potomac River is a high priority for Virginia residents.

Loudoun and Northern Virginia is one of the fastest growing communities in the country and provides a lot to Jefferson County in their symbiotic relationship. Virginia residents support and enjoy Jefferson County through tourism, as our residents enjoy the natural and historical resources of your county. Virginia residents and businesses support the equine industry in a multitude of ways from providing wagering fans at the races to the Virginia Breeders Association Virginia Certified incentive programs and a strong market for retired racehorses. According to an economic impact study from WVU, at least 40% of Jefferson County residents travel outside of West Virginia for work, a good percentage of those travel to northern Virginia. This rezoning would allow for industry that would negatively affect the economy of both places and this relationship and the benefits for our residents gleaned from it.

This zoning change will provide for industry that will negatively effect the health safety and welfare of the Loudon and Northern Virginia community. The Comprehensive Plan in Ranson is clear: the city has a duty to ensure that new industry will “not adversely affect the health, safety, or welfare of the community.” To achieve this the council must not approve this proposed zoning change. Please vote no on the ordinance #2017-302.

Sincerely,

david hatchett
